
T. A. Stiles, recently in charge of the construction of the United Verde Extension smelter, near Jerome, Arizona, will leave shortly for Oroya, in Peru, to build a large reduction plant in that country.

A Mining Circle has been formed at El Paso, Texas, with the following committee: **H. J. Baron**, chairman; **E. F. Knotts**, secretary, with **Leonard Worcester, E. S. Plumb, Harry Anderson**, and **J. J. Ormsbee. S. H. Worrell**, of the Texas School of Mines, and **J. A. Krakauer** are ex-officio members.

O. D. Rohlfs, formerly of the Original Amador mine, has been appointed superintendent of the Treasure mine near Amador City, California, succeeding **Charles Bell**, who resigned to accept a position in Nevada. **E. M. Herberger**, assayer and accountant at the Original Amador, has accepted a similar position at the Treasure mine.

THE METAL MARKET

METAL PRICES

San Francisco, August 27

Aluminum-dust, large and small lots, cents per lb	65—70
Antimony (wholesale), cents per pound	15
Copper, electrolytic, cents per pound, in carload lots	26.00
Copper, electrolytic, cents per pound, in small quantities	27.35
Lead, pig, cents per pound	8.30—9.30
Platinum, Government price, per ounce	$105
Quicksilver, per flask of 75 lb	$120
Spelter, cents per pound	11
Zinc-dust, cents per pound	17½

ORE PRICES

August 27

Antimony, 45% metal, f.o.b. California, per unit	$1.10
Chrome, 38 to 48%, California, per unit	$1.25—$1.50
Fluorspar, 85% CaF_2, f.o.b. shipping point, or San Francisco, per ton	$22—$30
Magnesite, crude, California, per ton (nominal price)	$7.00—8.00
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 45%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 85% MoS_2	$1.00
Pyrite, per unit of sulphur, cents	28—32
Tungsten, 60% WO_3, California, per unit	$20—$24

Chrome production of the United States in the first half of 1918 amounted to 26,000 tons, according to the U. S. Geological Survey. This averaged 40% Cr_2O_3, and is equal to 20,800 tons of 50% grade, the standard of calculation. Mining during this period was unfavorable until April, but at the present rate of output the year should yield 52,000 to 60,000 tons of 50% ore. Labor and transportation difficulties are much improved, and are being further bettered.

EASTERN METAL MARKET

(By wire from New York)

August 27.—Copper is unchanged but strong. Lead is acutely scarce. Spelter is strong and higher.

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government has fixed its maximum at 49½ pence.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.35c., respectively, until August 15. On August 7 the current rates were again fixed until November 1, prices to be effective on the day of shipment, not the day of sale.

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefor $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds.

Freight-Rates on Manganese Ore

On August 20 the Director General of Railroads ordered a general reduction in rates on manganese ore. The new carload rates, per ton of 2000 lb., with a minimum carload weight of 60,000 lb., follow:

From stations in	Group D (a)	Group 2 (b)	Group B and C (c)	Group A (d)
Oregon	$11.00	$12.50	$12.50	$15.50
Washington	11.00	12.50	12.50	13.50
California	11.00	12.00	12.50	13.50
Montana	8.00	9.50	9.50	10.50
Arizona	9.00	9.00	10.50	11.50
Colorado	7.00	7.00	8.50	9.50
Nevada	10.00	11.00	11.50	12.50
Utah	9.00	10.00	10.50	11.50
New Mexico	7.00	7.00	8.50	9.50

(a) Group D—Chicago, Indiana Harbor, and Erie.

(b) Group 2—Points in Alabama and Tennessee taking group C rates.

(c) Group B and C—Youngstown, Pittsburgh, Buffalo, and points in Ohio.

(d) Group A—Points in seaboard territory, including Goshen, Graham, Reusens, and Roanoke, Virginia.

The War Trade Board states that the list of restricted imports No. 1 has been so far modified as to permit the importation from Japan of 2,000,000 gal. of creosote during the remainder of the present calendar year.

Eastern Metal Market

New York, August 21.

Strength and quietness pervade practically all the markets, some being a little more active than others.

Demand for copper is heavy, now that the price has been definitely established for a period.

Tin has been quiet and is still scarce but offerings have been more liberal.

Lead is extremely scarce, with an apparent relief in sight.

Zinc is stronger and higher on better demand and limited offerings.

Antimony has advanced.

In the steel industry the output is still limited by the lack of coal and coke. An adequate labor supply, under the conditions that are to result from the new draft, is a serious problem. As to new iron and steel capacity there is not so much concern at Washington as anxiety to get a full-capacity output from existing units. The pig-iron shortage grows more acute, a situation that has obtained for months. Scrap shortage is added to the pig-iron scarcity, both tending to keep down the steel output. If existing capacity could be properly fed with raw materials, the output of steel ingots could be larger by 3,000,000 to 4,000,000 tons. For our forces in France 20,000 more cars have been bought.

COPPER

The most interesting news in the copper market, aside from the fact that buying for delivery up to November 1 has been extremely heavy since the price was settled for the period between August 15 and that date at 26c. per lb., unchanged, has been the suggestion by Director McAdoo that the railroads of the country be electrified wherever possible, and as soon as possible, as a war measure to save fuel. Copper as wire, and in other shapes, to carry out such a project would be large in amount and would exert a distinct influence on the market. Buying for delivery of copper beyond November 1 is possible only at the price obtaining after that date. It is stated that the output of crude copper is falling off, due to poor labor and to some inability to fill up the leaks. It is certain that the unprecedented hot weather in the New York district the past two weeks has interfered with the output of refined metal for over 90% is purified in this district. As to whether there will be copper enough to meet all demands is a disputed question, which only time will answer. Jobbers are permitted to ask 27.35c. per lb. for 5-ton lots and less.

TIN

Buyers continue to absent themselves from the market, and as a result the situation is uninteresting and quiet. There are two reasons for the lack of interest on the part of consumers: They are apparently fully covered by old purchases, and they desire to await the outcome of the meeting in London of American representatives with British tin interests. There is no news yet as to development from this conference, but, whatever they do, it is felt that a better understanding will result, with perhaps some simplification of the permit and license regulations. In the past week there have been more liberal offerings for shipment from the Far East, and October shipment from the Straits can be secured at 81c. per lb. This compares with about 84 to 85c. per lb. a few weeks ago, and with 97c. at the peak of the upward movement two or three months ago. A little business was done, but only a little. Arrivals of tin at Atlantic ports to August 15 have been 2320 tons and those at Pacific ports to August 17 inclusive, 3175 tons. Spot Straits in London was lower again yesterday at £377 10s., as against £387 10s. the week before.

LEAD

The scarcity of lead continues more pronounced, if it were possible, than a week ago. In fact lead producers, through their own committee, are continually exercising more control over the situation. It is now nearly impossible to obtain lead except by applying to this lead committee. The lead situation is quite similar to the tin in that it is practically impossible to buy it. The opinion is expressed that it may not be long before all lead consumers will have to furnish the Lead Committee with full particulars as to their requirements so as to relieve supplies in the order of their importance. Because some dealers have been receiving as high as 8.75c. per lb., New York, for lead urgently desired, it is understood that they have been or soon will be required to take only ½c. per lb. or 8.55c., New York, above the agreed price, otherwise their supplies may be restricted.

ZINC

In the past week the zinc market has developed a decidedly stronger tone and prices have advanced almost daily. One cause for this, or perhaps the inception of the upward movement, was the purchase last week of 3000 tons of grade D zinc by the Government. This is practically prime Western grade. Supporting influences have been the limited amount of offerings, and the shrinkage of stocks, as shown by the Government statistics now published weekly. According to these, stocks of grade D have been reduced 9000 tons in the last six weeks. Should the rate of decrease be maintained for six weeks more the surplus must be wiped out entirely. Prime Western zinc for August-September delivery is now quoted at 8.87½c., St. Louis, or 9.12½c., New York, with the likelihood that 9c., St. Louis, or 9.25c., New York, would be paid quite easily. A 9c. market is looked for in a day or so. For fourth quarter 8.85c., St. Louis, has been bid, and 8.90 to 8.95c. per lb. asked. Demand from consumers is reported as very good.

ANTIMONY

The market has advanced as a result of a better demand, both for early and future delivery, and is now quoted at 13.75 to 14c. per lb., duty paid, New York.

ORES

Ferro-manganese: Sales of about 1300 tons of domestic alloy have been made at $250 per ton, delivered, for 70%, with only $3.50 per unit above or below this standard, instead of $4 per unit, the former level. The market is not active.

Ferro-silicon: The Carnegie Steel Co., Pittsburgh, is making 50% ferro-silicon in its Duquesne plant, and will also make its own electrodes. It is not known whether the output of ferro-silicon will meet the needs of the company, which is the largest consumer in the country. For delivery this year, in small lots, $170 at the plant is obtained. One producer is making 10 to 12% alloy in an electric furnace, low in phosphorus, and obtaining $95 per ton at the furnace for it.

Molybdenum: Prices are nominal at $1 per lb. of MoS_2 in 90% material, buyers showing no interest.

Tungsten: High-grade ore has advanced if anything, due to a more active market. Some high-grade ore has sold as high as $25.50 with good wolframite going at $24.50 per unit in 60% concentrate. Low-grade ores command $20 per unit up. Ferro-tungsten is quiet at $2.30 to $2.45 per lb. of contained tungsten, one seller asking the latter level.

Book Reviews

Business Law. A working manual of every-day law. By Thomas Conyngton, assisted by Elizabeth A. Smart. Pp. 535, index. The Ronald Press Co., New York, 1918. For sale by 'Mining and Scientific Press'. Price, $4.

The principal points in this work that should be of value to mining and engineering companies are: the fundamentals of law, contracts, sales, fire and life insurance, employer's responsibility, corporations and their directors, taxation, arbitration, and the advisability of litigation. If an engineer considers these points a moment, he will admit that most of his troubles come under these heads. Law in its modern manifestations cannot be studied without some reference to economics and sociology. A few years ago, the latter factor was given little consideration, now it is all-important. This new book is not technical, the law in each case being concisely explained, so readers should be able to derive some advice from the examples given.

Elements of Electrical Engineering. By William S. Franklin and William Esty. Volume II. Alternating Currents. Pp. 408. Ill., index. The Macmillan Co., New York. For sale by 'Mining and Scientific Press', San Francisco. Price, $3.50.

As the title-page states, this is a text-book for technical schools and colleges. Few engineers in other lines than electrical work will care to make as much of a study of the subject as this book would require nor is it likely that the practising electrical engineer will care to have it as a reference book. For the purpose for which it was intended, however, the book is entirely satisfactory. Some of the chapter-headings are: The Alternator, Alternating Current Measurements, Harmonic Electromotive Force, Complex Quantity, the Polyphase System, Voltage and Voltage Regulation, the Synchronous Motor, the Transformer, the Induction Motor, the Single-Phase Series Motor, Switchboards, and Transmission Lines. The book is well illustrated and the authors have done their best to explain a difficult subject.

A Handbook on Piping. By Carl L. Svensen. Pp. 359, ill., 8 folding plates, index. D. Van Nostrand Co., New York, 1917. For sale by 'Mining and Scientific Press'. Price, $4.

The only means of conveying air, gas, and fluids is by means of continuous pipe; we may neglect gases under high pressure stored in pipes or cylinders as being of comparatively little importance. Wood pipe, in the shape of bamboo, has been used in the Orient for centuries. Wood pipe, made from logs, has been used for over 200 years. Welded-iron pipe has been in use since early in the nineteenth century. From then onward came cast-iron, earthenware, concrete, brass, copper, lead, steel, wood, and other types of pipe. These all have their particular use, whether it be for steam, gas, oil, or acid. Ordinary iron or steel pipe is very strong, resisting great strains before breaking. Another use for pipe is that of hand-rails and guards for machinery. A great length of threaded pipe can be laid in a short time, jointing being simple. With cast-iron pipe joints require extra time. Wood pipe, if of the stave type, also requires more care, but has great endurance. Many fittings have been designed for the jointing, expansion, and change of direction in pipe, also many valves. Tools for the cutting, threading, bending, and jointing of pipe are generally simple and few. Steam pipe requires insulating to prevent radiation; and water pipe requires covering deep in the ground to prevent freezing. All of the points enumerated above, and many others, are discussed in this practical treatise. We fail to find mention of pipe for acid, important, yet of little significance when compared with the extensive use of pipe for other purposes. Any engineer having a pipe problem on hand should find help in this useful handbook.

Second Annual Report of the State Oil and Gas Supervisor of California. Pp. 404. Ill., index. California State Mining Bureau, San Francisco.

The first part of this report is a so-called 'letter of transmittal' of 121 pages, and includes a general discussion of the work of the department, a copy of the law establishing the department, township-plats showing the area assessed for the work, and several brief discussions of special problems of oilfield development. Then follow separate reports by the four deputy supervisors on the work in their departments, including a summary of decisions rendered. A directory of oil companies and operators, together with brief information regarding capitalization and number of producing wells, is included. The report is nominally for the fiscal year 1916-1917, but some parts of the report have been brought up to December 1, 1917, while the data in the directory is corrected to December 31, 1916. While the delay in publication was presumably unavoidable, it is unfortunate that all parts of the report were not brought to approximately the same date. However, the report, like its predecessor, will be of great value to those interested in any branch of the oil industry.

Principles of Iron Founding. By Richard Moldenke. Pp. 494. Ill., index. McGraw-Hill Book Co., Inc., New York. For sale by 'Mining and Scientific Press', San Francisco. Price, $4.

This is probably the most complete book upon the subject that has appeared in English. After a brief historical introduction the industrial and financial status of the foundry is considered, together with foundry organization and management. The next chapter deals with the metallurgy of iron and the effect of the various impurities upon it. The various processes for making both wrought and cast-iron are then considered. The next chapter discusses the properties of cast-iron, after which the various kinds and the recommended composition of each are discussed. Foundry raw materials including metals, fuels, fluxes, refractories, facing and parting materials, and core-binders are then considered. The next chapters deal with the technology of combustion and with melting processes. Then comes a discussion of mixture-making and of testing cast-iron. There is a glossary of terms and an appendix containing specifications and directions for various physical and chemical tests. The book is well-illustrated and the treatment is as nearly non-technical as is possible considering the subject.

Modern Management Applied to Construction. By Daniel J. Hauer. Pp. 187. Ill., index. McGraw-Hill Book Co., Inc., New York. For sale by 'Mining and Scientific Press', San Francisco. Price, $2.50.

Although many of the investigations in connection with so-called scientific management have been made with regard to construction work, the fact remains that most construction work is not managed scientifically. This is largely because many contractors have risen from the ranks and have had, or at least have thought they had, little time for studying either technical literature or other contractors' methods. The author of the present volume, as a successful contractor, is in a favorable position to show the advantages of scientific management as applied to construction. While it is possible that in some respects his enthusiasm runs away with him, the case for study and planning is, in the main,

well stated. Financial arrangements and the choosing of construction plant are discussed. One entire chapter is devoted to shovels and shoveling to show the importance of apparently small details. Plant lay-outs and bonus systems are also considered. The book will be of value to both contractors and engineers. Its usefulness could, however, have been increased considerably by the use of a larger number of well-chosen illustrations and by the application of scientific methods of arrangement to the text of the book itself.

Ports and Terminal Facilities. By Roy S. MacElwee. Pp. 309. Ill., index. McGraw-Hill Book Co., Inc., New York. For sale by 'Mining and Scientific Press', San Francisco. Price, $3.

The importance of proper terminal facilities, particularly at ports, is becoming more and more apparent. The present volume, without attempting to discuss technical details of construction, gives a general view of the entire subject. After a brief introductory chapter, the leading ports of the world and the general characteristics of a well co-ordinated seaport are described. Competition between ports for rail and maritime freight is shown to be mainly dependent on rates and they in turn on many conditions. Transfers of freight by belt-line railroads and by lighters are then discussed. The American and particularly the Western reader will be surprised at the importance given to lighters not only for transfer between vessels but also between vessels and factories, and even between factories. Drays and motor trucks are then considered, together with methods for avoiding congestion of deliveries. Piers, wharves, quays, and wharf, shed, and warehouse equipment are discussed, together with methods of handling special kinds of freight. Chapters are devoted to inland waterways, industrial-harbor development, and free ports, with particular attention to the free ports of Bremen and Hamburg. A bibliography is also given. The book is well illustrated and the treatment throughout is non-technical.

Hydraulic and Placer Mining. By E. B. Wilson. Third edition, revised. Pp. 425, ill., index. John Wiley & Sons, New York, 1918. For sale by 'Mining and Scientific Press. Price, $3.

Hydraulicking is not only used in moving gold-bearing gravel; it is also employed in stripping overburden from silver veins, as at Cobalt, Ontario; washing alluvium from other mineral deposits; leveling ground in hilly cities, as at Seattle, Washington; reclaiming coal from culm piles in Pennsylvania; and washing sand and debris into mine workings, as in the Rand and Europe. Therefore others than gold-miners should find the work of value, when it is considered from these viewpoints. The second edition appeared in 1907. Of the United States gold production, 25% is recovered by placer mining, including dredging; and of the 5300 gold and silver mines, 30% are placers, so that this form of mining is important. Before a gravel deposit can be mined, naturally a number of factors are to be considered; such as geology, prospecting and valuing, water supply, ditches, flumes, and piping, giants and nozzles, method of elevating gravel if necessary, sluice-boxes, and disposal of debris. These points are fully discussed in this book. Being essentially a work on hydraulicking, dredging is covered in a short chapter; although traction dredges and dry-placer machines—for use where water is scarce—receive attention. Methods of valuing placer ground include recent articles in the technical press. The chapter on Graphic Hydraulics will be found useful to those who have to calculate the duty of water. Some space is devoted to black-sands, which do not carry so much gold as has been stated during past years, and which could be treated if they were really valuable. Placer-mining laws and useful tables complete one of the few works on this subject. The illustrations could have been much improved by new ones from the field; however, they do not detract from the subjects discussed.

The Vaporizing of Paraffin for High-Speed Motors (Electric Ignition Type). By Edward Butler. Pp. 117. Ill., index. Charles Griffin & Co., London, and J. B. Lippincott Co., Philadelphia. Price, $1.50.

Paraffin in British usage, as most of our readers will remember, is the word applied to approximately the same distillate of petroleum that is called kerosene in America. Gasoline has become so expensive and so difficult to obtain at any price in England that the demand for a kerosene-carbureter is even more insistent than it is in America. The present volume discusses the carbureters for gasoline and the modifications necessary in order to construct a kerosene-carbureter. The author has apparently made a careful study of his subject. However, the book is so carelessly written and the style is so involved that we do not believe many persons will have the patience to dig out the facts that the text doubtless contains. A fair example of the general style is furnished by one sentence that contains 124 words, including three clauses introduced by 'which', and one by 'and this'. The book's usefulness for the American reader is further impaired by the fact that British technical terms and names for the various petroleum distillates are used entirely, and no glossary is provided. In short the book is an excellent example of what a technical treatise should not be.

Bookkeeping and Cost Accounting for Factories. By William Kent. Pp. 252, ill., index. John Wiley & Sons, Inc., New York. For sale by 'Mining and Scientific Press', San Francisco. Price, $4.

Many engineers who have used Kent's 'Pocketbook' will be surprised to learn from the preface to the present volume that the author was a bookkeeper and cost-accountant for several years before he became an engineer, and is therefore unusually well qualified for the task he has set himself in this book. The first three elementary principles show that, by the use of the combined journal-ledger, the labor of taking a trial balance may be eliminated. The system of accounts recommended by the Federal Trade Commission is discussed and several improvements are suggested. Factory accounting is then shown to be distinct from commercial bookkeeping. The principle is stated that in the general books of a manufacturing concern the operations of the factory should be treated as if they were those of a separate business, belonging to outside persons. The author shows that the cost department should be divorced from the accounting department. Methods of cost-finding are described and distribution of burden is discussed thoroughly. Depreciation, inventory valuation, appraisals, daily and monthly records, classification, and bookkeeping by machinery are considered in turn. The latter part of the book is devoted to practical cost-accounting in various industries, including foundries, blast-furnaces, machine-shops, hardware factories, textile mills, power-plants, and printing-shops. The book will be of great value both to the engineer and the cost-accountant.

RECENT PUBLICATIONS

Manganiferous-Iron Ores of the Cuyuna Range, Minnesota. By Edmund Newton. Pp. 126, maps. Bulletin 3 of University of Minnesota, Minneapolis, 1918.

Slag Viscosity Tables for Blast-Furnace Work. By A. L. Field and P. H. Royster. Pp. 35. Technical Paper 187 of U. S. Bureau of Mines, Washington, 1918.

Company Reports

CALUMET & ARIZONA MINING CO.

Property: copper mines at Warren and smelter at Douglas, Arizona; also control of the New Cornelia mines at Ajo, and the Tucson, Cornelia, and Gila Bend railroad to Ajo; and an option on the Gadsden copper mine at Jerome.

Operating Officials: J. C. Greenway, general manager; L. D. Ricketts, acting; W. B. Gohring, superintendent of mines; H. A. Clark, smelter superintendent; M. Curley, general superintendent of New Cornelia.

Financial Statement: during 1917 income totaled $20,035,866, of which $19,513,033 was from metals. Operations cost $9,358,213, plus $2,157,947 for State and Federal taxes, and $1,891,205 for ore depletion and depreciation. The net income was therefore $6,628,501. Investments at cost, including $789,000 of Liberty Bonds, total $6,673,538. Other assets are $3,243,203 of notes receivable, $1,081,034 supplies, $2,186,007 cash, $2,954,657 metals on hand and in process, and $271,472 of sundries. Current liabilities total $2,189,984. The railroad earned a profit of $98,140.

Dividends: in 1917 there was paid $10 per share, equal to $6,424,762, and a special of $1, or $642,479. The total since 1903 is $98 per share, amounting to $35,992,762.

Development: labor troubles in the second half of the year hindered operations considerably. There was 98,161 ft. of new work accomplished. Generally, results on the deeper levels of the Oliver, Cole, Junction, and Briggs shafts were good. Nothing has been done to the new Campbell shaft since the strike. Water pumped amounts to 1900 gal. per min. from the 1800-ft. level, and 1500 gal. from 1500 ft., a total of 3400 gal. In 1916 this was 3580 gal. A new 1488-gal. duplex double-acting plunger-pump is now working at 1800 ft. in the Junction. It is driven by a 1000-hp. direct connected motor. This machine is of new design, having no gears or speed-reducing devices.

Production: 50,572 tons of high sulphur ore was shipped to outside points; 3259 tons of manganese ore was sold to steel-makers at Chicago and Birmingham; 1607 tons of lead-zinc sulphides was sold to Kansas paint-makers, and 1458 tons of lead ore was sent to El Paso. Including custom ore (295,286 tons) the two blast-furnaces reduced 585,975 tons and the four reverberatories 525,007 tons of charge. An average of 13.3 roasting-furnaces handled 451,255 tons, reducing 31.6% sulphur to 10.2%. The converters produced 48,466 tons of blister copper. Metal yield was 59,131,512 lb. copper, 906,039 oz. silver, and 27,948 oz. gold.

The acid plant started in March 1917, and produced 50,225 tons of 50°B. sulphuric acid, equal to 177 tons daily. Since October it has made 223 tons per day. Four roasters supply all the sulphur necessary.

MINING CORPORATION OF CANADA

Property: silver mines and mills at Cobalt, Ontario. Reports are given in considerable detail.

Operating Officials: D'Arcy Weatherbe, consulting engineer; C. E. Watson, manager.

Financial Statement: the revenue in 1917 totaled $3,964,494, of which $2,604,434 was operating profit. Adding the balance from 1916, interest, and dividends, there was available $5,378,405. The balance carried forward to 1918 was $3,448,378, or $1,000,000 more than that from 1916. Cash assets total $1,032,815, and current liabilities $171,306.

Dividends: four and bonuses totaled $1,556,297.

Development: there was a total of 8494 ft. of work done, and a little diamond-drilling. This makes 21 miles to date. Little work was done in the Townsite mine. Old stopes supplied broken ore. Reserves contain 257,040 oz. of silver, against 763,700 oz. a year ago. In the south workings of the Cobalt Lake mine work was stopped, but in the lower levels it was vigorously pushed to find extensions of the rich City ore-shoot and of finding ore in the Lake Fault vein. Results were disappointing. The same ground is to be explored in the upper levels. The City mine was the principal producer, and most of the ore-reserves are in the rich but intricate vein system. Reserves consist of 373 tons of ore containing 1800 oz. per ton, and 30,991 tons averaging 28 oz., a total of 1,545,370 oz., or less than half of that a year ago.

Production: 595.85 tons of shipping ore averaged 2344.66 oz. per ton, and 83,489 tons of milling ore carried 40.16 oz. per ton. The total extracted from crude ore, concentrate, and by cyanidation was 4,485,542 oz. This makes 27,614,582 oz. to date. Extraction was 94.43%, a gain of 2.29%. The ratio of ore milled to concentrate produced was 68.4 to 1.

Costs: a comparison is as under:

	Per ton		Per ounce	
Item	1917	1916	1917	1916
Mining	$2.42	$1.85	$0.0453	$0.0475
Development	0.24	0.37	0.0045	0.0094
Exploration	2.08	1.65	0.0390	0.0424
Treatment	4.57	4.12	0.0856	0.1059
Freight and realization	4.40	2.12	0.0825	0.0543
Administration, etc.	1.11	0.75	0.0209	0.0191
Royalty, taxes, etc.	4.44	2.57	0.0833	0.0660
Total	$19.26	$13.43	$0.3611	$0.3446

OLD DOMINION COMPANY

Property: the mines, mill, and smelter of the Old Dominion Copper Mining & Smelting Co., and United Globe Mines, at Globe, Arizona. Early in 1917 the Old Dominion acquired all assets of these companies, previously controlled by it.

Operating Official: W. G. McBride, general manager (formerly P. G. Beckett).

Financial Statement: from July 1, 1917, labor troubles hampered operations considerably. Income last year was $8,635,171. Expenses were $6,258,662; taxes, depreciation, etc., $1,155,244, leaving a profit fo $1,221,265. To this is added $367,586, balance from 1916; and $5,607,894, net surplus of Old Dominion C. M. & S. Co., and United Globe, making available $7,196,745. After paying dividends the surplus at December 31, 1917, was $4,820,483.

Dividends: $8 per share was paid, equal to $2,376,262, making $13,216,976 since 1905.

Development: new work amounted to 24,321 ft., against 42,018 ft. in 1916. Considerable development was done in the upper levels, but most was done with best results on No. 18, the lowest. Sinking at 3 shafts aggregated 502 ft. The west-side orebodies supplied most of the smelting ore, and the east-side bodies most of the concentrating ore. Water pumped amounted to 1,494,830,000 gal., of which 730,000,000 gal. was sold to the Miami Copper Co. The pumps are now capable of discharging 20,000,000 gal. in 24 hours. The maximum flow was 4,898,393 gal. on March 12, and minimum 3,466,620 gal. on December 31, the latter the same as in 1916.

Production: the mill dressed 199,575 tons of 3.78% ore, recovering 88.01% at a cost of $1.254 per ton, against 254,213 tons, 3.89%, 86.63%, and $1.142 per ton in 1916. Flotation saved 30.54% of the total. The smelter reduced 198,548 tons of charge, costing $3.134 per ton, compared with 271,367 tons and $2.793 per ton in 1916. Converting cost $8.96 per ton of fine copper, a gain of $1.37. The metal output (including custom metal) was 32,365,795 lb. copper, 165,703 oz. silver, and 3898 oz. gold.

Magnesium production of the United States in 1917 was 115,800 lb., against 116,938 lb. in the first half of 1918. The American Magnesium, Norton Laboratories, and Rumford Metal companies in the East make this powder.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

HULETT EXCAVATOR FOR COPPER LEACH-TAILING AT AJO

By Franklin Moeller

*Considering the short time that has elapsed since hydrometallurgical processes of extracting copper from its ores have been extensively developed, and the large scale on which this method is practised at Ajo, the successful operation of the plant must excite the admiration of every visitor. The application of the mechanical unloader at Ajo is but an extension of the use for which it was originally designed, some 20 years ago, for unloading iron-ore vessels at the lower Lake ports. At a time when the maximum output of a single machine, with men shoveling the ore into buckets, did not exceed 40 tons per hour, G. H. Hulett invented and constructed a mechanical unloader with a bucket of 10-ton capacity. This machine was of the steam-hydraulic type, and it is still in operation after nearly 20 years of service. Several more machines of the same type were built, but the difficulties of power transmission, and the rapid development of electrical machinery, soon led to the adoption of electrically operated machines, and practically all of the later installations have been thus equipped. This electrically-operated unloader has proved so well fitted for the work that the design of the Lake boats has been practically revolutionized, with respect to the ease and rapidity of unloading. It is now possible to unload a 12,000-ton vessel with four machines in a little over 2 hours. The largest machine yet built handles an average of 17 tons, with a possible maximum of 20 to 21 tons.

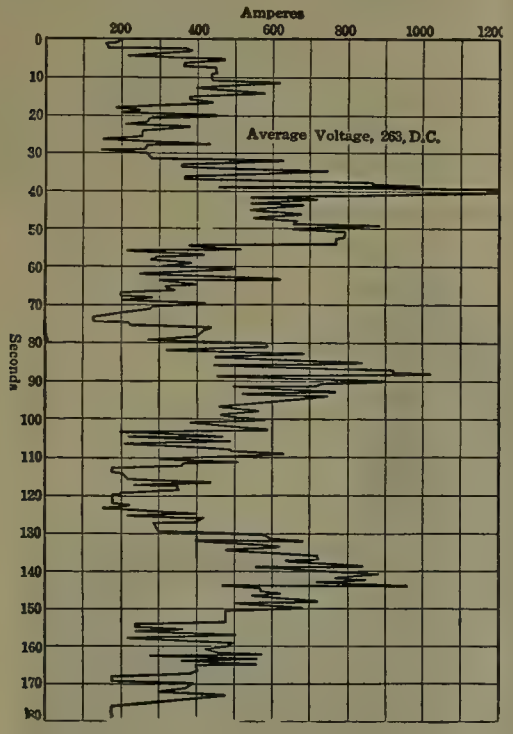
'THE BIG BEETLE'; HULETT TAILING-EXCAVATOR AT NEW CORNELIA COPPER LEACHING PLANT, AJO, ARIZONA

The excavator at Ajo is somewhat simpler in design than the iron-ore unloader, in that it is not provided with a larry.

*Abstract: 'The Tailing Excavator at the Plant of the New Cornelia Copper Co., Ajo, Arizona,' Trans. A. I. M. E., to be read at the Institute meeting, September 1918.

In the unloader the iron ore, grabbed by the bucket, is delivered to a larry or transfer-car which runs in the lower chord of the bridge; the larry then delivers the ore either into railroad cars, standing on several parallel tracks, or into the stock-pile, thereby saving the time that would be required for the bucket to make the trip. At Ajo, the bucket delivers the tailing directly into cars, and as the distance is short, the capacity of the machine is limited only by the regularity with which the cars can be supplied.

The leaching-tanks from which the tailing is to be removed are 12 in number, arranged in two parallel rows.



POWER DEMANDS OF EXCAVATOR DURING THREE MINUTES

Each tank is 88 ft. (26.8 m.) square, and, when filled to a depth of 14 ft. 6 in. (4.42 m.), holds 5000 tons of ore; one tank is emptied each day. The excavator has a span of 106 ft., just sufficient to clear the buttresses on both sides of the tanks. Beyond the bridge runway, on one side of each set of tanks, are the railroad tracks for the cars, which convey the tailing to the dump. To move the excavator from one row of tanks to the other, a transfer table is provided, having a runway at right angles to the bridge-runway of the excavator. The excavator cansists essentially of four parts, namely, the bridge, the trolley, the walking-beam, and the bucket. The bucket is of the two-part type, and each shell is given a considerable sliding action during the closing movement, thus acting as a hoe, and ensuring a more nearly complete filling of the bucket when approaching the bottom of the pile. When open, the distance between the cutting edges of the shells is over 20 ft. (6 m.). The shells are U-shaped, without back-closing piece, so that the bucket can always be closed without choking. The opening and closing chains are attached to cam-shaped drums, rotated by gearing and rope-drum set in the vertical leg to which the bucket is attached. The bucket can be rotated about the axis of the bucket leg through an arc of about 325° in either direction, and as the centre of the bucket is offset about 2 ft. from the centre of the bucket-leg, it can clean up, in any given position, a space 24 ft. (7 m.) in diameter. The driving mechanisms for all the bucket-movements are on the end of the walking-beam opposite to that where the bucket-leg and bucket are attached. The mechanism for raising and lowering the bucket is also placed in the walking-beam.

The use of the walking-beam has several advantages; it provides a ready means for balancing the weight of the bucket; it eliminates the hinged cantilever of the bridge; and its length can be adjusted to suit special requirements. In order to ensure vertical movement of the bucket the bucket-leg is fitted with parallel rods. The forward or bucket-end of the walking-beam is not entirely balanced, and the downward movement of the bucket is due to gravity, but always under control of the operator. A solenoid brake on the motor holds the bucket in any position. The main trolley, to which the walking-beam is pivoted, is mounted on two 6-wheel spring-bearing trucks set immediately under the pivot posts. The rear end of the extended trolley is fitted with upper and under-running wheels to prevent this end of the trolley from lifting. The trolley is moved by a rack and pinion, operated by a motor-driven mechanism, and is supported on a moving bridge, both legs of which are mounted on two four-wheel equalizing spring-bearing trucks, one of each set being provided with driving-gears. The wheels are double flanged, and the trucks have ball-and-socket connections to allow for full equalization. One of the trucks is also provided with an expansion-bearing to permit the bridge structure to adjust itself to inequalities of the track gauge. Power is applied to the trucks in the customary manner, the motor for driving the bridge being set in its lower chord. All of the movements of the bucket are controlled from one point by a single operator, who rides in the bucket-leg, immediately above the bucket. He can thus maneuvre the bucket with perfect accuracy and assure the maximum output of the machine. One movement, that of the bridge, is not controlled from the bucket-leg, but the operating levers for it are so placed that they can be reached by the operator when near the middle of the bridge. An assistant looks after oiling, etc. Altogether about 500 hp. of direct-current motors are required. Safety appliances are provided. The machine will handle 500 tons of tailing per hour, which is equivalent to a bucketful every 72 seconds.

To avoid injuring the bottom of the tanks, the tailing is removed only to within 6 in. (15 cm.) of the bottom. Men are then sent down to shovel the remainder into windrows so that at the next excavation the greater portion of this tailing will be removed. The tailing is delivered into 20-ton cars, running on a track parallel to the line of the tanks, and the operators become so adept in manipulating the discharge of the bucket that practically nothing is spilled outside of the cars or back into the tanks. The actual amount of current required per ton of material is extremely low, and the accompanying chart gives a clear picture of the power demands. It frequently happens that the operator combines the closing, lifting, and traveling movements, and by doing so creates a heavy peak-demand. It is interesting to note how the cost of discharging ore has been cut by improved methods. When steam-hoists were first used, the total cost was 40 to 50c. per ton. With the introduction of the bridge-system, this was reduced to 18 to 20c. per ton, and with the present type from 4 to 5½c. per ton.

The transfer-table is of simple construction, consisting of two 8-wheel trucks connected by a steel structure, and operated by an 80-hp. motor, giving the table a speed of 75 ft. per minute. The transfer table is fitted with latches to ensure proper registering of the table tracks with the excavator tracks, and its movements are controlled from a cab placed on the table.

[The Hulett excavator described is manufactured at Cleveland, Ohio, by the Wellman-Seaver-Morgan Co.—Editor.]

Announcing——

The Crowe Vacuum Precipitation Process

This process is the invention of Thomas B. Crowe, Metallurgist of The Portland Gold Mining Company, of Colorado Springs, Colorado. Broad patents have been granted covering the use of the process, both in the United States of America and in foreign countries. These patents are now owned by the Merrill Metallurgical Company.

The Crowe Process has now been in use for upwards of two years, and has definitely passed the experimental stage. The results obtained in a number of plants, under widely varying conditions, warrant our belief that this process constitutes the most important single improvement in precipitation practice since the early days of the cyanide process.

The process is now in operation, handling the entire solution tonnage, at the following large plants:

The Homestake Mining Company	3 plants
The Portland Gold Mining Company	2 plants
The Golden Cycle Mining & Reduction Company	1 plant
The Tonopah Belmont Development Co	1 plant
The United Eastern Mining Company	1 plant
The Elko Prince Leasing Company	1 plant

The process is also being installed by the following companies in Mexico and South America:

Cia. de Real del Monte y Pachuca	2 plants
Cia. de Minas La Blanca y Anexas	1 plant
The Esperanza Mining Company	1 plant
The Mexico Mines of El Oro	1 plant
The Alvarado Mining & Milling Company	1 plant
The South American Development Co	1 plant

Deliveries of the necessary equipment can be made practically from stock, and the installation is a matter of a few days without interruption of regular operations.

The Crowe Process is particularly adapted for use in conjunction with the Merrill Precipitation Process, or with the standard zinc shavings boxes. With either system, a substantial saving in zinc, and particularly in cyanide, will be effected. The process is equally applicable to small as well as to large plants, since practically no power is required and very little supervision is necessary.

We are prepared to submit full details of equipment and to quote prices for the use of the process.

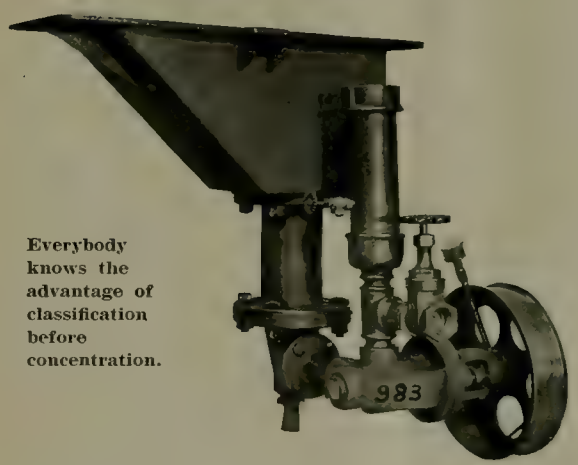
Screenless Classification
FOR SMALL MILLS

may be effectively accomplished at small first cost, small floor space, and minimum power consumption, through the use of the

DENVER ENGINEERING WORKS CO.

RICHARDS
Pulsator Classifier
Launder Type



Everybody knows the advantage of classification before concentration.

Here is the solution to the question: A classifier of the hindered settling, pulsator type; a machine without screens, utilizing through the simplest mechanical means the effect of a pulsating current of water in an upward direction against the downward course of the mill pulp. The impulses gently separate the lighter particles and discharge them at the end of the launder, while the coarse sand passes down and discharges through the spigot provided for the purpose.

This classifier is specially designed for fastening to the bottom of the discharge launder from the stamps or ball mill.

The space occupied is inconsequential; the power consumed likewise. One adjustment only is required, that separation between fine and coarse pulp may be made at any desired point.

Write us for further particulars, prices and specifications
We can help you to improve your extraction at small cost

Heretofore mechanical classifiers have been available only in machines of large capacity with high first cost and large space occupied. This has in a large measure prevented the small mill operator from taking advantage of the higher extraction assured by classification of the mill pulp before concentration.

NOTES 305

THE I. W. W. CONVICTIONS 306

Bolshevism in America, in the shape of the I. W. W., has no place here. The recent heavy sentences imposed upon the leaders should act as a deterrent to others having like anti-social tendencies. M. & S. P., September 7, 1918.

THE FUNCTION OF GOLD 307

This discusses the function of the Federal Reserve Bank and its importance as an equalizer in time of financial strain; the hoarding of gold in a safe or in an unworked mine; the volume-ratio of gold to liabilities; the latent energy of gold; and the cost of producing gold. M. & S. P., September 7, 1918.

DISCUSSION

PLATINUM AT GRAND CANYON

By John M. Boutwell 309

In our issue of June 15, we commented on the prospectus of the U. S. Platinum Co., considering it contained extravagant estimates. Mr. Boutwell denies that he wrote any report, and his name should not have been used in the prospectus. He is now examining the property, and will give details later. M. & S. P., September 7, 1918.

FUTURE GOLD AND SILVER OUTPUT

By M. T. Chestnut, Jr 309

An interesting letter, mostly on silver. It will take 3.6 years for American mines to produce the 270,000,000 oz. to be taken from the Treasury. Colorado is a large silver producer, ten of its counties having yielded 291,000,000 oz. in 40 years. There is little chance of more silver bonanzas being found. Mr. Chestnut considers that the price of gold and silver should be increased. M. & S. P., September 7, 1918.

ARTICLES

FLOTATION FLOW-SHEETS

By Algernon Del Mar 311

These are suggestions for mill-men who find it necessary to alter the flow of pulp in their plants, particularly regarding the number, size, and situation of cleaners and roughers. M. & S. P., September 7, 1918.

Page

DETERMINATION OF MOLYBDENUM IN ORES

By Welton J. Crook and W. L'A. Crook 313

Volumetric and gravimetric methods, with modifications, are described. A good bibliography is included. M. & S. P., September 7, 1918.

CONDENSING QUICKSILVER FROM FURNACE-GASES

By L. H. Duschak and C. N. Schuette 315

A valuable article, the result of careful investigations at the largest quicksilver mines in America. Losses during condensation of mercurial fume have been considered large, but the authors proved them to be but a small proportion of the output, although there have been large losses. The recovery of 96 to 99% of the mercurial vapor entering a good condenser system should be made without difficulty. A feature of this investigation is the sampling of fume. M. & S. P., September 7, 1918.

MAGNESITE AT MID-YEAR, 1918 324

The present rate of output in California and Washington is below that of 1917. Large quantities of cheaper and lower-grade Canadian ore are being imported. Analyses are given of 29 samples of domestic magnesite. M. & S. P., September 7, 1918.

FLOTATION AT MOUNT MORGAN, AUSTRALIA 325

On an ore averaging 2.29% copper and $5.10 gold, recoveries of 93.01% and 76.19%, respectively, are being made. M. & S. P., September 7, 1918.

PULVERIZED COAL 325

Classes of coal, moisture, screening, transportation, burning temperatures, heat-value, and costs are all discussed briefly. M. & S. P., September 7, 1918.

MOBILIZATION OF ENGINEERS 326

Reproduction of Government classification blank for engineers. M. & S. P., September 7, 1918.

Just Why is the MARCY Grate?

The Marcy Discharge Grate has revolutionized Ball Mill practice.

The principle of the old ball mill was fundamentally right, but it took the Marcy Mill to turn the tide of popular approval completely in favor of the short-type Ball Mill as the cheapest and best method of ore reduction for cyanidation, flotation, amalgamation, concentration, etc., and it was the Marcy Grate that did it.

There are, to be sure, other things which contribute to Marcy efficiency, but without its patented grate the Marcy would simply be "another" ball mill.

Now, just "why is the Marcy Grate?"

Why does it contain so many slotted openings, running from the periphery of the mill to a point near the center?

The grate is intended to hold back the coarse ore and balls and allow the fines to escape. A small head of water carries the fines through the slots and away from the grinding zone practically as fast as they are produced.

The small head of water makes a thick pulp, which greatly increases the mill's grinding capacity because of the ore particles which adhere to the balls. If need be, the pulp may be so thick as to scarcely run down a steep launder.

On account of the discharge at or near the periphery of the mill, the mineral and gangue have an equal chance to escape. There is no segregation of coarser mineral particles in the mill.

All this means little slimes because of the short time in which ground material stays in the Marcy Mill.

Capacity 4 to 1000 tons per day depending upon the size and crushing conditions.

It means ONE EASY STEP, from crusher product to material for concentration, flotation, etc., with the minimum of oversize.

IN this issue we publish an article on the condensation of quicksilver from the gases coming from the furnaces in which mercurial ore is roasted. The article is by Messrs. L. H. Duschak and C. N. Schuette, of the U. S. Bureau of Mines; it exhibits both skill in research and care in writing; therefore we are glad to give it to our readers.

SIR ROBERT BORDEN, the Canadian Premier, on his return from Europe, where he had again visited the battle-line, delivered the following message from the Canadian army overseas to the people of the Dominion: "Stand fast to your purpose, abide the issue, and vindicate the cause of justice and humanity." These words find a ready echo in the hearts of each of the Allied peoples. We must stand fast to the end and beware of the poisonous gas of premature peace proposals.

THE resignation of Mr. H. L. Carnahan, as State Commissioner of Corporations, is announced. Charges of political intrigue have been exchanged between the Governor and the Commissioner, who received a peremptory order to get out of office. Whatever the cause of the quarrel, we regret the loss of a thoroughly capable official, who was doing splendid work in checking chicanery in mining finance, as in other applications of company promotion to the industrial development of California.

OFTEN we have endeavored to establish a distinction between 'investment' and 'speculation.' Others have done so. For example, a gentleman in the State of Washington signing himself M. E. states that a certain mining venture is "an investment, NOT A SPECULATION," and he uses small caps just like that. He says: "A 1000-stamp mill could not exhaust it in a hundred years. With its billions of tons of ore of a uniform grade piled thousands of feet high between sharp ends and clean-cut walls that show no sign of the disturbance since the subsidence of the force that placed it there, without a break or a fault apparent in the entire length of it, and considering that it is in OUR OWN STATE OF WASHINGTON, within one day's journey of Seattle, instead of in some far off and inaccessible mountain fastness, or across the bleak and wind-swept tundra in the frozen land of the North. This property should be one that would interest the most conservative as well as those looking for a speculation." Yet he assures the possessor of surplus cash that it is "not a speculation." We agree: it looks like a damned certainty.

EVERY day brings its casualty list. We read the list and are grateful if we find no name to cause a pang of personal sorrow. We may feel glad of that, but then there comes the reminder that in the list are men equally good having friends as dear to them as our own kinsmen are to us. We share the sorrow of others and realize that these splendid young fellows have died for our cause, for us. If we remain at home, immune from the risk of life and limb in battle, it remains for us to back their effort and to show appreciation of their supreme sacrifice by making the much smaller sacrifice of contributing cheerfully to the campaign for Liberty bonds. They have fought victoriously against the Enemy, it is for us to make the next Liberty Loan a testimonial to their prowess.

ALASKA GOLD made a loss of $14,247 on the 309,249 tons milled during the quarter ending June 30. The tonnage milled was 1821 per day less than in the preceding quarter. The mill-feed assayed $1.16 per ton, as compared with 99c. in the first quarter of the current year. The mine is "seriously hampered," says Mr. Charles Hayden, the president of the company, "by the lack of competent labor and the steadily increasing cost of supplies"—which is true, but this mining enterprise is handicapped most of all by the lack of sufficient gold in the rock that is being exploited in the hope of gain. Mr. Hayden expresses a hope that the Government may afford some relief to the gold-mining industry in the near future and thereby help the Alaska Gold out of a bottomless hole. As the thing now stands, the Alaska Gold is a benefactor—not to its shareholders or bondholders—but to the Nation, for it is producing a necessary product at a loss to itself. The Alaska Gold Mines Company deserves a halo.

LABOR DAY had unusual significance this year, for the parades placed emphasis on the fact that the workingman was giving solid support to the cause of humanity in the great contest against militaristic slavery. Two incidents provoke particular satisfaction: Mr. Samuel Gompers, as the official representative of organized labor in the United States, received the right hand

of welcome from the British Premier, Mr. Lloyd George, on the day that W. D. Haywood and his fellow-conspirators of the I. W. W. were committed to prison under heavy sentences for breaking the law in their anti-social effort to impede the draft and to sow dissension among the ignorant. The War has had the effect of arousing public opinion in every class against unpatriotic utterance or act, thereby giving force to the law against sedition however disguised. Labor has joined with capital, the employee with the employer, in resenting any attempt to oppose the national will in the intention to win this war and to prevent the recurrence of another similar outrage against humanity.

LEST we forget, it is well to make note of the manner in which the Germans in a submarine treated the crew and passengers of the French steamer 'Lydiana' off the coast of Spain on July 16, as reported a few days ago. The 'Lydiana' was not a warship, but she was torpedoed without warning, several of her crew being killed forthwith. While a boat was being lowered a second torpedo was fired, tearing the boat from the davits but failing to sink her. Seeing this, the captain of the submarine used his murderous craft to ram the boat, cutting her in two and drowning most of those in her. Having accomplished this, the German went for a second boat, which had been launched successfully, and rammed her also, killing the captain of the 'Lydiana' and hurling a young girl into the air so violently as to kill her likewise. The murderous performance was not yet completed, for the German tried to sink a raft carrying the remaining survivors. When one of them, a ship's officer, left the raft and endeavored to swim back to the sinking 'Lydiana', the submarine was turned so as to kill him by its propellers. Then, raking the 'Lydiana' once more, so that she sank, the Germans made a sixth and successful attempt to ram the raft, amid the laughter of the U-boat's captain and crew. Eight men were saved by a patrol boat and lived to tell the story—a story thoroughly characteristic of German chivalry. Such stories, when authentic, must be kept in mind when the Enemy begins to whine for peace. What treaty of peace could we make with such a beast? What assurance for the future could we obtain from a military caste having no sense of honor? The only safety for the future of civilization lies in such punishment, including invasion, as shall cause the German people to unhorse the Hohenzollern dynasty and also to cause the German people themselves to resolve never again to try to dominate the world.

TARTARIN looked at Sonia, the pretty Russian nihilist, and could not believe that her little hand, so slender in its chamois glove, had displayed the courage to kill a man. Here is the contradiction of the lingering tiger that on occasion overcomes the spirit of peoples in their training to observe the decencies of law. Lenine was probably as unwilling as the famous Gascon of Daudet's clever imagination to believe that the pretty hand of a Russian 'intellectual' could deal a bolt of death. To clear the Russian air of Lenine, were not outside influences at work, would be like eliminating the dark cloud of Marat from the France of the Revolution, so that constructive forces might begin to build a nation out of a liberated canaille. Russian women are not unaccustomed to acts of violence, yet the seeming parallel to Charlotte Corday cannot fail to strike the observer and prompt the question how far the similitude may carry. We would feel more convinced of a rising healthy sense of the indignity imposed upon Russia by the Bolshevist conspiracy with Germany if a Russian mob had driven the traitorous Lenine across the border into the country of his employers. It is hard to foresee what the downfall of Lenine and Trotzky may betide. It might be the signal for the restoration of the moderate Socialists who are said to see hope of support for the landowners against the self-assertive peasants by working in harmony with Germany. There is peril in this possibility, just as there is peril in the Teutonic policy of inciting jealousies between rival Russian local governments. A united Russia would be a menace to Germany, and it is seen how cleverly the separatist movements have been fostered by the Prussian managers. Bolshevism was the necessary preliminary form of spurious pacifist patriotism to let down the national tension from a state of actual war, but it was also manifest that a firmer order, under a land-holding class, so subdued by the riotous proletariat as to welcome even German aid for its preservation, would be the next instrument that the Teutons would wish to use. We fear that Charlotte Corday after all may not prove to be re-incarnate in Russia.

The I. W. W. Convictions

Bolshevism in America received a stinging blow when Haywood and 14 other leaders of the I. W. W. organization were sentenced to 20 years in the Federal penitentiary by Judge Landis at Chicago after a trial by jury that ended on August 30. Besides these, 80 others were sentenced to shorter terms of imprisonment, together with the imposition of fines ranging from $20,000 on Haywood and the other ringleaders to $5000 on the lesser agitators. The combined concurrent sentences of the 95 I. W. Ws make a total amounting to 807 years and their fines to $3,130,000. It remains to be seen whether the judgment of the Court will be reversed in a new trial, but if it be justified by the evidence, as it seems to be, we hope it will stand as a warning against the attempt to destroy the democratic organism of the United States. The trial lasted 128 days, the accused were well defended, they received the justice to which they were entitled. The four counts of the indictment included charges of conspiracy to thwart the national prosecution of the War, to interfere with the production of material needed for the War, to obstruct the enforcement of the draft, and to violate the espionage law. The Judge laid stress on the I. W. W. preamble declaring eternal hostility to the employing class, on the action of the executive board in expelling members that had entered military service, and on the concerted plan to in-

cite strikes and sabotage with a view to impeding the Government in waging war. Among those sentenced are several identified with the worst outrages that have marked labor disorders in the mining districts of the West, notably W. D. Haywood and Vincent St. John, whose names recall the strikes at Cripple Creek, Telluride, Butte, and Wardner in years gone-by, and, ineradicably, the assassinations of Arthur L. Collins in 1904 and of Governor Steunenberg of Idaho in 1908. The trial has proved the I. W. W. organization to be not only anti-social in time of peace but traitorous in time of war. It is to be hoped that the infamy stamped upon this Bolshevist organization will prevent it forever from exerting any further influence among workingmen in the United States and will prevent them from ever again being terrorized into participation with the political incendiarism of a gang of outspoken criminals. The evidence at the trial showed how large a part sabotage plays in the methods of terrorism used by the I. W. W. They tried it against the Government in time of war and thereby invited the merciful punishment of an outraged democracy—in any non-democratic country they would have seen their last sunrise long ago. We note that the Socialist party has been impelled to wash its hands of them; it was high time to do so, for the I. W. W. is not socialistic in any sense, it is anti-social; it is as much opposed to a socialistic organization of society as to any other; it is purely and maliciously destructive, like the criminal idiots that have brought the Russian revolution from a hopeful success to a miserable fiasco, from intelligent reformation to political chaos and industrial collapse. There is no more room for the Bolshevist idea in the United States than there is for the Prussian; the effort to destroy all social order is as repugnant to the American as the attempt to create a militaristic tyranny. We shall fight the Bolshevist at home as relentlessly as the Prussian abroad, and it is well that we fight the one with the left hand while we use the right hand against the other, for each is equally the foe of democracy. The Prussian and the Bolshevist alike are the enemies of representative government and of that ordered way of living we call civilization.

The Function of Gold

Discussion concerning the possible salvation of the gold-mining industry continues with unabated vigor. It will receive fresh impetus at the meeting of the Northwest Mining Association to be held at Spokane on September 5. It is a question of paramount importance, fully meriting the serious consideration it is receiving, and we are gratified to see that the organs of the banking and financial interests are giving as much attention to it as are the representatives of the mining industry. The 'Commercial and Financial Chronicle' reproduces the resolutions adopted by the American Gold Conference at Reno, with approval of its declaration for sound money and an undisturbed unit-measure of value. It is fair to assume that the problem of producing more gold will be discussed by the American Bankers' Association at its annual convention at Chicago on September 23. The August bulletin of the Federal Reserve Board has brought the issue strongly before the country in terms that involve a conscious interlocking of the interests of the bankers and the gold-producers. It says: "Ever since the establishment of Federal Reserve banks, the Board has endeavored by every legitimate means to increase the aggregate gold holdings of the banks. . . . Of late the Board has received questions from various quarters respecting the reasons of theory supporting the course which it has urged with respect to gold. The situation in this regard is perfectly plain. In proportion as the gold holdings of the Federal Reserve banks are increased, the ability of such banks to extend accommodation to other banks, or to issue notes, is enlarged. Taking 40% in gold as normally required as a minimum behind every note that is issued, it is clear that, in order to lend $100 in Federal Reserve notes, a Federal Reserve bank must have on hand in its vaults, or with a Federal Reserve agent, $40 in gold. In proportion as its reserve holdings are curtailed, its lending power is correspondingly reduced. Some question also has been raised with reference to the practice of hoarding gold. Every dollar of gold that is hoarded is withdrawn not only from reserve use but also from circulation. It is a net loss of that amount of metal to the community. The effect of its concealment is, therefore, to remove the possibility of providing the strongest possible gold-cover for our growing volume of bank-notes and deposits. The desirable conditions, under existing circumstances, is to have every dollar of gold in the Federal Reserve banks, while the circulating medium consists of currency based on gold. Money of every kind, whether gold or silver, should be deposited in bank and used, but not hoarded. Surrender of gold coin and gold certificates, and abstention from hoarding, means an increase in the volume of bank-credit available for the community, and an increased ability to finance its war and other requirements." An extension of this doctrine is contained in the circular issued by the Federal Reserve Bank of San Francisco on August 1, where it is affirmed: "Gold in possession of a member bank or of an individual serves no necessary purpose which other forms of money would not serve, but in the possession of a Federal Reserve bank it gives financial protection to the country as surely as an army gives physical protection. To draw soldiers from the Army or to keep them from the Army to perform services that others could perform, would weaken our physical defense and invite disaster. Likewise to hold gold out of the reserve of the Federal Reserve banks weakens our financial defence and invites financial disaster. . . . The increasing demand upon the Federal Reserve Bank is shown by the fact that although the amount of the gold reserve has increased over $31,000,000 (in the three-month period ending June 30) the proportion of gold to liabilities has decreased approximately 1%." These authoritative statements show conclusively the important function of new gold in sustaining the national credit. Our margin of protection to issued currency is

ample at the present time, but it is declining. In finance, as in war, the rule for success is initiative, but initiative is unavailing without numbers. Even Napoleon confessed that the victories he had scored with forces inferior to those of his enemies had been won by maneuvers that enabled him to beat them, division by division, in detail. A decline in the volume-ratio of gold to liabilities, in the face of large accessions to the reserve, is a cogent argument for sustaining the production of new gold. Gold that is available but not produced is a more serious economic waste than coin that is hoarded. The miser with his hidden coffer dries up some of the lubricant in the journal-boxes of commerce; it is as if a part of the oil had leaked away so that the oiling-rings could not pick up enough to reduce the friction. The gold mine that is closed, however, presents the additional stress of lost homes, lost markets, lost capital, and the sacrifice of the potential value of equipment through the ravages of rust and the vandalism that cannot be repressed when plants are idle. A great reservoir of energy is suffered to waste its power when gold that might be used is left in hiding, whether in the mine or in the pocket of the timid hoarder. It is possible for the banker to definitely estimate this loss. Some affirm that the total expansive effort of gold in facilitating commercial movement is in the ratio of one to seven. We see that, in the case of the Federal Reserve, its direct ratio of expansion, or energy-ratio, as we might call it, is as forty to one hundred, or 2:5. By authority of the British government, we understand, the ratio in England has been advanced to 5. This, however, is but a fraction of the power residing in the gold price-measuring unit. The Federal Reserve Bank is an equalizer to take up the strains when the pressure of demand for credit becomes too great upon the commercial banks of the country. It is the safety-valve for the relief, not of the whole pressure, but of the margin of excess over the proper working-strain. The commercial credits, based on securities representing potential production but not active capital, are in the last analysis founded on a safe admissible credit-expansion of the gold reserve. Thus even the gold that may be in circulation is performing a feeble and barbaric service compared with its harnessed power in the delicate mechanism of refined finance. Each ounce must be regarded as something more than so much token-metal with which to purchase so many bushels of wheat; it is like the water that, on being converted into steam, develops enormous power compared with the potential energy that the original volume may have possessed by virtue of its elevation above the sea-level. Gold in the hands of the individual, in the vaults of a trust company, or in the unmined quartz of the mine, is just so much gold, a metal, ductile, dense, brilliant, and beautiful, for which men normally will exchange no more wool than for a certain equivalent face-value of National Bank notes; put it in the Federal Reserve and it becomes converted into an elastic medium that expands, some tell us even twenty times its unit-value, to drive the engines of commerce. The latent energy in an ounce of gold is independent of human effort and the consumption of ordinary commodities involved in putting it into the Treasury. This is touching a delicate and perhaps the most important feature of the present economic position. The monetary unit is the regulator; it makes no difference in our individual wealth whether we suddenly multiply all prices of commodities and labor by ten or divide them by two; the relative status of the individual as a purchaser of personal comforts or of investment securities would remain unaltered. Whatever be the factor, or however we apply it to prices, if it affect them all, our arbitrary, or whimsical, or phychologic re-appraisal of commodities in terms of our customary unit will in time be re-adjusted by the normal relations of supply and demand in terms of that same unit, and will be brought again close to the normal average level. It is essential, in viewing this question with special reference to ways and means for promoting the continuous production of new gold, to keep clear the distinction between price and cost. This has been stated in a striking manner by a distinguished economist of a past generation, J. E. Cairnes, who wrote a luminous essay 'On the Gold Question,' which then perturbed the world on account of the overwhelming Australian production. He said: "Why is the price of labor so high in Australia? The answer is, because the cost of gold is so low; the rate of money wages, as we have seen, always rising and falling as the facilities of producing gold increase or diminish; which shows, by the way, the absurdity of attempting to measure the cost of gold, as some writers have done, by the pecuniary outlay necessary to its production. The fact is that this (so far as gold is the money employed) scarcely ever varies; the gold price of producing gold representing merely the ratio of the outlay to the return, or the rate of profit, so that if the price be taken as the criterion of cost, the cost of gold would never vary unless so far as the rate of profit varies. The reader must observe that by 'cost' is meant the real difficulty involved in the production of a commodity, not the amount of money necessary to renumerate the labor by which this difficulty is overcome. The only commodity of which the 'cost' was affected by the gold discoveries was gold; but the 'price' of producing everything was altered." For us, at this moment of serious decline in gold production, the chief lesson from all this is that the gold standard is our datum line, the mean tide-level of the sea of commercial relations, which remains fixed regardless of flood or drought, but the gold is also more than a standard: it has potential energy, when so placed as to work for the whole people instead of a few, enabling the people through their Treasury to extend to the miner a portion of that credit into which his gold can be expanded, to meet the cost of the necessaries for production. Thus his rate of profit may be maintained so as to make the operation of his mine remunerative, and he will furnish the substance of the elastic credits required in war finance without altering the size of the gold-measure of value. It was on this principle that the American Gold Conference wisely pronounced in favor of an unchanged monetary standard, while seeking pecuniary relief. We believe that the gentlemen at Spokane will endorse that position.

Platinum at Grand Canyon

The Editor:

Sir—As your editorial of June 15, regarding platinum at Grand Canyon, Arizona, might be interpreted as reflecting injuriously upon my integrity as a mining geologist, I ask you to publish the following statement of facts:

I have been engaged by the United States Platinum Co. to examine its properties at Indian Gardens, Grand Canyon, Arizona, and I have accepted this engagement with the express provisions that I should have an absolutely free hand to ascertain the truth and to give my conclusions to the public. As to references to a report on this property by me, I wish to state that I have never written any report on that property. The prospectus mentioned was prepared and published entirely without my knowledge and I have only recently succeeded in securing a copy. Accordingly, neither its statements nor its publication has received my approval. I am now on the ground examining this property. When I have secured facts which warrant final conclusions, I shall give out those conclusions, whatever they may be, for the information of the public. JOHN M. BOUTWELL.

Grand Canyon, Arizona, August 16.

Future Gold and Silver Output

The Editor:

Sir—In April 1918 the Walsh-Pittman Bill passed by Congress authorized the treasurer of the United States to withdraw 350,000,000 silver dollars from the Treasury to provide 270,000,000 ounces of silver to be used for settling foreign-trade balances and to furnish metal for smaller coins for ourselves and our Allies.

In these days of bond-issues totaling three to six billion dollars at a single issue, 270,000,000 ounces of silver or units of any other commodity seem like a trifle; in fact, we have become so used to figuring in billions that a few odd millions seem like car-fare.

But few people have a proper conception of what the production of 270,000,000 oz. of silver costs in terms of time and labor, so that the following figures are interesting at this time, when much talk is heard about the future of silver and about increasing the value of gold and silver. The figures are taken from various publications of the U. S. Geological Survey and reports by the Director of the Mint and are approximately correct.

In 1916, Colorado produced 7,500,000 oz. of silver. At this rate of production, it would take Colorado 36 years to produce 270,000,000 oz. In the same year, the production of the United States was about 75,000,000 oz. At this rate it would take our total production for 3.6 years to replace the 270,000,000 oz. in the Treasury. In 1916 it was estimated that about 33,000,000 oz., or nearly half of the silver produced, went into industrial consumption in the United States.

During the past five years, the world's production of silver has shown a decided decrease in quantity. This year it will be lower than at any time since 1880. The consumption is exceeding production, hence the United States government must draw on the only large stock of silver in existence, to meet the emergency created by war conditions.

This 270,000,000 oz. of silver was laid by in the days of plenty; it represents the savings or surplus of years of plenty, and the labor of thousands of men. To replace it from new production may be more of an undertaking than one would think. The days of plenty for silver have gone forever, and if our Government, or any other government, ever accumulates a similar amount of silver, it will be at a far greater cost in time and labor, and certainly at a greater cost in dollars and cents.

The following ten counties in Colorado have had some fame as producers of silver, but, from the time of discovery to the present, they have produced but little more than the amount authorized to be taken from the Treasury. They may possibly produce as much more, but it will be at a considerably increased cost per ounce, and from ores of far lower grade than have been mined heretofore.

Approximate Silver Production of Ten Counties in Colorado

County	Oz.
Pitkin	93,000,000
Clear Creek	55,000,000
Mineral	42,000,000
Ouray	36,000,000
San Juan	26,000,000
Dolores	12,000,000
Gilpin	10,000,000
Boulder	6,700,000
Custer	6,000,000
Hinsdale	5,000,000
Total	291,700,000

It has taken the work of thousands of men during 40 years to produce 291,000,000 oz. of silver. Does anyone familiar with the mining industry venture to claim that there are ten more districts like them that remain undiscovered in Colorado?

Congress authorizes the withdrawal of 270,000,000 oz. of silver from the Treasury, with the understanding that this amount will later be replaced, and this is but a trifle less than the total silver production of ten of the silver-mining districts of the world.

Lake county, which contains Leadville, the greatest silver district in Colorado, if not in the world, has produced about 225,000,000 oz. in the last forty years. It will take more than another Leadville and Creede combined to replace this 270,000,000 oz. of silver in the Treasury, and where will another Leadville or Creede be found?

The Comstock lode in Nevada, discovered in 1859, has produced about 223,000,000 oz. of silver, which is 47,000,000 oz. less than the amount Congress authorizes the Treasurer to withdraw from the vaults of the Treasury, yet the Comstock lode has been called the world's greatest silver deposit, and mining men the world over are pretty well agreed that its like will never again be found. In 59 years the labor of thousands of men did not produce what Congress authorizes the Treasurer to withdraw from the vaults, a part of which has already been melted and sold for far less than it can be replaced.

At the time of discovery of either the Comstock or of Leadville, one man with a pick and shovel, and a fairly strong back, could, and in quite a number of instances did, take out several tons of ore per day that would carry 500 to 1000 oz. of silver. There is probably no place in the world where this could be done today. The cost of production was probably the lowest ever attained.

Our future supply of silver must come from the low-grade mines, and from mines of the baser metals that produce silver as a by-product. These do not produce enough to fill the requirements, so that any increase in supply must come from the old silver mines and from lower-grade ores than any heretofore worked; and, to enable these mines to produce at a profit, silver must bring a higher price per ounce than at present.

Metallurgical processes have made great advancement during the last ten years, and further improvements of processes may still be made, but it is doubtful if the grade of ore that can be handled at a profit will be materially lowered. In treating ore it is not the number of ounces or pounds of a metal contained that is the vital factor, but it is the value of the ounces or pounds. By increasing the value of an ounce of gold and silver, millions of tons of the low-grade ores in the mines of the West will become of commercial value. Without an increase of value for the gold and silver content of these ores, they will remain a dormant asset, and might as well be so much barren rock.

If an increased quantity of gold and silver is wanted and needed to bolster up our national credit and that of our Allies, there is but one way to get it; that is, to increase the value of the ounce of gold and silver to the miner. If this is not done at once, there will be an enormous loss in the quantity produced in the next two years, and after that a continued falling off in production at a more gradual rate, for many years, as numbers of mines are today consuming reserves and doing no development. When the reserves are gone the mine is gone.

Mining today is more a matter of dollars and cents than ever before and unless it can be demonstrated that there is a reasonable chance to make a profit, it will be impossible to work low-grade ores. There is going to be an enormous demand for money after the War to enable our manufacturers to expand their foreign trade. If we are to expand our foreign trade, mining must compete with the demand for money to finance this expansion, and capital is going into the business that seems to promise the greatest chances for profit. New industries have sprung up during the War and will be in the market in competition for money with the gold and silver mining industries. Mining will have to be made a more profitable business in the future than it has been in the past to compete in the money market of the future.

There is another valid reason why, at this time, the value per ounce of both gold and silver should be increased to the miner for all future production. The West has been drained of the money in buying Liberty Bonds and War Savings Stamps; also in a large proportion of the money donated to the Red Cross and Y. M. C. A. The West has not held back on any of the drives, but has generously over-subscribed. This money has been spent mostly in the East and the enormous demand for financing new war-industries has kept it there. We of the West are furnishing probably less than 2% of the manufactured war requirements, so that there is no way in which our proportion of this money can be put back into circulation in the West, unless it be by an increased price to the miner for our gold and silver production. It has always been noted in the West that when the mining was prosperous, every other industry was prosperous.

An increased price for both gold and silver would, beyond all doubt, furnish a large increase in the number of ounces produced and serve to make a more equitable distribution of the money; also it will aid in the establishing of manufacturing in the West far more than any other steps that can be taken, and it is a recognized fact today that our manufacturing centres are concentrated too extensively in the East, which fact was mainly responsible for the coal tie-up last winter, and is one of the principal reasons for the serious outlook for the distribution of coal through the industrial centres of the East for the coming winter.

Silver certainly must and will advance in price. There is no valid reason why a bonus should not be paid for the gold produced from now on. Certainly, if an increased quantity of these metals is wanted, they will of necessity be made worth the miner's time to produce them, otherwise the miner will go into a more profitable business.

The palmy days of Leadville, the Comstock, Aspen, Creede, Cripple Creek, and the Mother Lode are gone, and the sooner the general public realizes the fact, the sooner it will see the necessity for an increased price for these metals, and the better for the future of the mining industry. Had the general public understood the situation as regards silver, I doubt very much if Congress would have ventured to authorize the sale of 270,000,000 oz. at less than the cost of replacement.

Mining is as legitimate a business as any other and is entitled to as much consideration. It has not had it.

Denver, August 21. M. T. CHESTNUT, JR.

Flotation Flow-Sheets

By ALGERNON DEL MAR

In flotation flow-sheets of various mills that I recently presented,* one, two, and three cells, or groups of cells, were in use as cleaners or roughers. From the operator's point of view the correct flow of the pulp is second only in importance to the right manipulation of the oils, hence I am giving additional illustrations, so that the operator who has not had time to work out his particular problem satisfactorily may perhaps see a way to change the flow, following the suggestion here shown. The

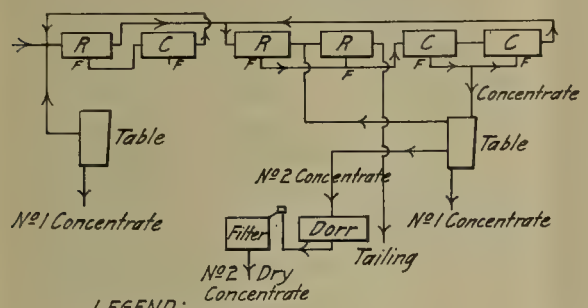

FIG. 1

number and size of cleaners and roughers necessary for the maximum efficiency is in great part determined by the amount of mineral in the pulp and by its readiness to respond to flotation treatment. A small quantity of sulphides that resist flotation, or that do not readily separate from the other sulphides, may require one cleaner cell, or group of cells, and two or three roughers, while another ore with a fair proportion of sulphides may require two to four cleaners to two roughers. Having determined this point, the problem is to pass the pulp through roughers and cleaners in such a way that the sulphides recovered are of a marketable grade and loss in the tailing is held low. The cleaner may precede the rougher or the rougher may precede the cleaner. If there is only one rougher in the system the cleaner should come first, because if the rougher is first and the machine be out of order from lack of proper feed, the rougher-tailing, which goes to waste, would carry an appreciable quantity of mineral, whereas if the cleaner were used first the pulp would have to pass through both cleaner and rougher. Where two or more roughers are in the system, the roughers should preferably precede the cleaners, for the mineral has greater chances

*'Mining and Scientific Press,' February 16, 1918.

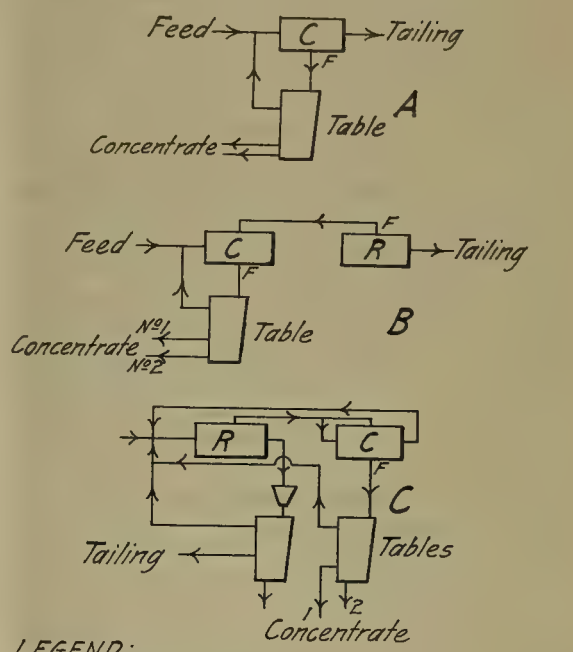

FIG. 2

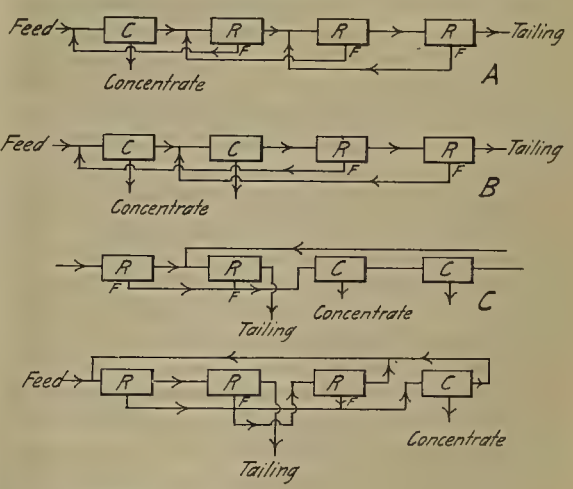

FIG. 3

of recovery before being cleaned, and the tailing from the cleaner is again passed through the rougher. Where two or three roughers precede the cleaner it is unlikely that more than one rougher will be out of order at one time, so the pulp may pass through one machine without proper treatment, but receive proper treatment in the next, but should all the roughers be out of order, say from defective power-requirement, means should be provided to cut out the flotation-feed and run the roughers in a closed circuit until good running-conditions are restored.

In speaking of 'roughers' and 'cleaners', either one cell or a group of cells is implied; for example, we may have a one-cell K. & K. machine or a group of M. S. cells. The four examples in Fig. 1 show flow-sheets with one or two cleaners and two or three roughers. *A* is a counter-current group, in which the pulp travels in a direct line, while the concentrate is returned to the preceding cell, being enriched until finally taken off the first or cleaner cell. *B* shows the same idea with two cleaners. *C* is a well-arranged and popular flow-sheet with two cleaners and two roughers, a variation of which is to send the last cleaner-tailing to the first rougher instead of to the second. *D* embodies the same idea with a single cleaner, and is a good combination for small quantities of sulphides that require preferential separation in the rougher cells.

A concentrating table in a flotation flow-sheet may answer one or all the following purposes:

1. Breaking of froth.
2. Separation of one or more minerals from the concentrate.
3. Taking the place of another flotation-cell by dividing the concentrate into a marketable product and another product that is to be returned to the flotation cells for re-concentration.
4. Recovering oil for re-use.

In the flow-sheets Fig. 2, *A* is a single-cell cleaner, where the concentrate is tabled, the reject being returned to the flotation-cell. From the fact that in this system the pulp is passed but once through the machine it would appear that a table is a necessary adjunct of a one-cell system. In *B* we have a cleaner and a rougher, the table acting in the same capacity as in No. 1, that is, to break the froth. The reject from the table might preferably go to the rougher-cell, because it contains an excessive amount of moisture and a thin pulp would harm good work in a cleaner-cell, while in the rougher-cell the amount of moisture in the pulp is not so important. *C* shows two tables, one after the cleaner and one after the rougher. The latter will recover what concentrate may escape the rougher when this is not working satisfactorily, and likewise return the excess of oil for re-use. The table after the cleaner answers the same purpose as in *A* and *B*. Sometimes it is not practicable to float a commercial grade of concentrate, in which case it may be necessary to re-concentrate on a table and reject that part of the table-concentrate which is not saleable and not return it to the system at all. For example, a flotation concentrate may be so impregnated with iron that the concentrate is not marketable. This iron may be separated on a table and rejected, making a commercial product of the remaining mineral or minerals.

In Fig. 3 is given a flow-sheet where two different minerals are separated by the flotation process, the one most readily raised being treated first, the tailing then going to other cells for the separation of another mineral. It will be observed that this flow-sheet is a combination of those already represented by the diagrams. In the illustration herewith, I believe I have shown the importance of selecting an appropiate flow-sheet for a pulp according to the requirements of the particular ore. It may be that it is impracticable to obtain a marketable product with a flotation-cell alone, but that a concentrating table might solve the problem if placed in the circuit at the right place.

BAUXITE exists in great quantities in India in the lateritic deposits on the west coast of the peninsula, both above and below Bombay, to a distance of 120 miles from that city, as well as at Belgaum farther to the East. Other lateritic bauxites are found in Central India in the provinces of Bihar, Orissa, Chota, Nagpur, Rewah, and Bhopal. Shortly after the outbreak of the War the Indian government entered into negotiations with the firm of Tata Bros. & Co. for the study of the problem of utilizing these ores. After detailed examinations it was decided to establish a hydro-electric plant on the river Koyna, a stream rising in the western Ghats, and flowing into the Krishna. A dam is to be built to impound the waters, since the rainfall is not well distributed throughout the year, but amounts to 20 inches during the period of the monsoons. The reservoir will cover an area of 56.8 square miles with a maximum depth of 275 ft., and will impound 21,188,400,000 cubic feet of water. The head of water at the power-house will be 565 ft., and about 350,000 hp. will be developed. This power will be used to operate a large aluminum plant, in addition to which works for the production of synthetic ammonia will be established.

ALUMINA is obtained from materials containing compounds of other metals, such as Na, K, Ca, and Mg, by converting all the metals into nitrates and heating the mixture to about 140–300°C., under reduced pressure, so as to decompose only the $Al(NO_3)_3$. The undecomposed nitrates are removed by lixiviation and may be separated or used as a fertilizer, and the nitrous oxides evolved may be converted into HNO_3. The process may be applied to plagioclase rocks, which are for this purpose treated with nitric acid. The method was devised by H. Goldschmidt, for which British patent 113,276 was granted on February 5, 1918.

MANGANESE is being mined from the Mandinga property, 70 miles east of Colon, in the Canal Zone. About 18,000 tons had been shipped to June 25. The owners are negotiating for a deposit 12 miles south of Porto Bello, on the Boqueron, a branch of the Chagres river.

Determination of Molybdenum in Ores

By WELTON J. CROOK and M. L'A. CROOK

The following methods for the analysis of molybdenum-bearing ore are the results of selecting and carefully testing methods proposed by many analysts.

Method 1: Volumetric. Titration with standard lead acetate. This method may be used either for ores or ferro-molybdenum. Fuse 0.5 to 1 gm. of the sample with 4 gm. Na_2O_2 till liquid, using a nickel crucible. Continue heating for five minutes after fusion and run the fusion up the sides of the crucible. The temperature should not have reached more than dull red heat. Extract with water in a beaker and rinse the crucible. Boil down to about 150 cc. and filter; wash with hot water and acidify the filtrate with acetic acid. Heat to boiling and titrate the colorless solution with standard lead-acetate solution, using tannic acid as an outside indicator. The end-point is reached when the brown color no longer develops. When much iron is present in the sample it is better to fuse with NaOH in the following manner: Fuse 10 gm. NaOH in a nickel crucible till a pasty mass is formed. Mix the sample with 3 gm. Na_2O_2 and carefully add the mixture in small quantities at a time. When the fusion is complete, add another 3 gm. of Na_2O_2 and conduct the fusion as before.

Standard lead-acetate solution is made as follows: Dissolve 25 gm. lead acetate in water. Add a small amount of acetic acid and dilute to 1 litre. 1 cc. of this solution will equal approximately 0.01365 gm. lead, or 0.00633 gm. molybdenum.

Standard ammonium molybdate solution: Dissolve 10 gm. of finely powdered ammonium molybdate in water. If the solution is not clear, add a few drops of NH_4OH. Dilute to 1 litre. 1 cc. of this solution will equal approximately 0.01056 gm. lead.

Tannic-acid indicator: Dissolve 0.1 gm. tannic acid in 30 cc. water. Make up fresh as required.

Standard lead sulphate for standardizing: Weigh out exactly 0.2 gm. of pure lead, dissolve in HNO_3 and evaporate nearly to dryness. Add 20 cc. H_2SO_4 and evaporate to fumes. Cool, dilute, and allow $PbSO_4$ to settle. Decant through a filter and wash twice by decantation. Dissolve the $PbSO_4$ on the filter with boiling ammonium acetate, allowing the filtrate to run into the beaker containing the bulk of the $PbSO_4$. When all the $PbSO_4$ is dissolved, titrate boiling with the standard ammonium molybdate, using the tannin indicator. The end-point is reached when a drop on the spot-plate with tannic acid gives a brown color.

Titrate the standard lead-acetate solution against the standard ammonium molybdate solution. Pipette 50 cc. standard ammonium molybdate solution into a beaker, acidify with acetic acid, and dilute to about 150 cc. Boil and titrate boiling with the standard lead-acetate solution, using the tannic acid indicator. Calculate the value of the lead-acetate solution in terms of molybdenum.

Method 2. Titration with standard lead acetate. Dissolve 2 gm. of sample in 20 cc. HNO_3, 20 cc. HCl, and 20 cc. water. After 10 or 15 minutes add 20 cc. 60% H_2SO_4 and evaporate to copious fumes. Cool, dilute, and filter off $PbSO_4$ and silicious matter. Heat the filtrate to boiling and add a few crystals of ammonium persulphate. Boil a few minutes to destroy the persulphate, cool and precipitate with H_2S for 1 hour. Boil for a few minutes and filter; wash with H_2S water. Transfer as much of the precipitate as possible back to the beaker with water. Dissolve that remaining on the paper with boiling dilute aqua regia (1 part HNO_3, 1 part HCl, and 3 parts water). Run into the beaker containing the bulk of the precipitate and boil till all is dissolved. Filter off any sulphur, add 5 cc. 60% H_2SO_4, and evaporate to white fumes. Cool, dilute to about 60 cc., neutralize with (1:1) NH_4OH till there is a distinct smell. If a white or yellowish precipitate of bismuth forms, filter. Neutralize the solution with acetic acid, add 5 gm. sodium acetate, and titrate with standard lead acetate, using tannin as in method (1).

Method 3. Volumetric. Titration with potassium permanganate. This method is useful when molybdenum and tungsten are present in the same sample. Weigh out the sample and make fusion as in method (4). Dissolve the melt in hot water, and filter. Boil the filtrate and add 20 cc. of Mdivani's reagent for each 0.15 gm. WO_3 present. The volume of the solution should be kept between 60 cc. and 300 cc. according to the amount of tungsten present. Boil for 3 minutes, filter and wash the blue precipitate with hot 5% HCl, till the filtrate gives no test for Mo when tested as follows:

If a drop of a saturated solution of mercurous nitrate, followed by from 1 to 1.5 cc. concentrated HCl and an excess of KI is added to the solution to be tested, and the mixture well shaken until the mercurous iodide at first formed is completely dissolved, the presence of Mo or W is indicated by a blue color, developed either at once or after a short time. In this way very small amounts of W may be detected. If the color is caused by Mo, it may be changed to a deep blood red by the addition of potassium thiocyanate, and even with solutions too dilute to give the blue color, an orange shade may be produced by the addition of this reagent. The orange color may be extracted with ether. If the estimation of W is required, ignite the blue precipitate in a porcelain crucible, and weigh as WO_3.

Evaporate the filtrate to a small bulk. Cool; transfer to a 25-cc. volumetric flask and dilute to the mark. Mix well and transfer 50 cc. of the solution to a beaker. Add

5 to 10 gm. sheet zinc to precipitate the tin. Allow to stand for 10 minutes. Filter and wash the residue with hot water. Heat the filtrate to 60° C., and pass through a Jones reductor in the following manner: Pass through the reductor 50 cc. 2.5% HCl, then the molybdenum solution, then 150 cc. of 2.5% HCl, and finally 150 cc. hot water. Before these solutions are passed through the reductor, charge the receiving flask with 20 cc. 10% $Fe(NH_4)(SO_4)_2$ solution and 20 cc. of 'titrating' solution. Titrate the total content of the flask with N-10 $KMnO_4$. A blank test should be run and the $KMnO_4$ consumed deducted from the main determination. The iron value of the permanganate × 0.605 gives the molybdenum.

Mdivani's reagent: 50 gm. $SnCl_2 2H_2O$ in 200 cc. concentrated HCl.

'Titrating solution': 90 gm. crystalline $MnSO_4$, 650 cc. H_2O, 175 cc. syrupy H_3PO_4, and 175 cc. concentrated H_2SO_4.

Method 4. Gravimetric, weighing as molybdenum oxide: Mix 0.3 gm. of the sample with equal parts of Na_2CO_3 and Na_2O_2, and fuse in a nickel crucible, finishing at a bright red heat. After cooling, dissolve the melt in hot water and filter. Treat the filtrate with an excess of yellow ammonium sulphide and warm on a water-bath. Add a slight excess of dilute H_2SO_4, little by little. Blow a current of air into the solution to remove the excess of H_2S. Filter the solution, wash and dry the paper, and precipitate. When dry remove as much of the precipitate as possible to a porcelain crucible; burn the filter separately, and add the ash. The molybdenum sulphide is converted to MoO_3 by heating over a small flame. The $MoO_3 \times 0.66667 = Mo$.

Method 5. Gravimetric, weighing as molybdenum sulphide: Digest 0.3 gm. of the sample with 25 cc. fuming HNO_3 for several hours, and evaporate to dryness. Treat the residue with 2 or 3 cc. H_2SO_4 and take up with 50 cc. water. Filter while warm, wash with water, with dilute NH_4OH, and again with water. Precipitate the iron and alumina in the filtrate with NH_4OH; filter, and boil the filtrate down to 150-200 cc., and add an excess of yellow ammonium sulphide. If present, filter off the precipitate of copper sulphide, add HCl, and warm the solution. Filter off the precipitate of molybdenum sulphide; evaporate the filtrate to dryness, and drive off much of the ammonium salts. After cooling, dissolve the residue in NH_4OH, and add ammonium sulphide. Filter the solution again, and add the precipitate of molybdenum sulphide to that previously obtained. Ignite the precipitates with sulphur in a current of hydrogen, and weigh as MoS_3 (or ignite to MoO_3). $MoS_3 \times 0.49946 = Mo$.

Method 6. Gravimetric, as molybdenum sulphide: This method is the one adopted by the U. S. Bureau of Mines and is used for ores containing only traces of arsenic or antimony. Digest 0.2 to 0.5 gm. of sample with 25 to 35 cc. fuming HNO_3 for 3 hours, and finally evaporate to dryness. Add 3 cc. concentrated H_2SO_4 and heat to dense fumes. Cool, dilute to 100 cc., filter and wash with water. Then wash the residue well with (1:3) NH_4OH, and finally with water. Make the filtrate ammoniacal, heat, filter, and wash well with hot water. Saturate the alkaline filtrate with H_2S to a bright cherry red color. Filter and wash with hot water. Acidify the filtrate with HCl until slightly acid and digest till the precipitate and the sulphur are well coagulated and the excess H_2S is expelled. Filter through a weighed Gooch crucible. Evaporate the filtrate to dryness in a casserole and drive off the ammonium salts at the lowest possible temperature, being careful not to heat the casserole to redness at any time. Take up the residue with 100 cc. water and 5 cc. NH_4OH, add 10 cc. ammonium sulphide, make faintly acid with HCl, and digest till the sulphide has coagulated. Filter through the Gooch crucible previously used. Add an amount of sulphur to the combined sulphides equal to about one-half their weight and ignite over a Bunsen burner at a dull red heat in a stream of arsenic-free hydrogen. The weight obtained is MoS_3.

The references below will be useful in further research upon the determination of molybdenum, whether in ores, ferro-molybdenum, or molybdenum steel.

THE FOLLOWING TABLE shows the Baku oil production in 1913, 1914, 1916, and 1917, in barrels of 42 gallons. The original figures in Russian poods, published in the 'Frankfort Gazette,' were converted at the United States Geological Survey rate of 8.33 poods (crude oil) to the barrel:

Wells	1913	1914	1916	1917
Old fields, barrels	46,680,000	40,560,000	39,480,000	31,570,000
New fields, barrels	9,360,000	10,368,000	17,700,000	16,704,000
Total	56,040,000	50,928,000	57,180,000	48,704,000

GANISTER, or quartzite, used in making silica brick, showed the following output in the past three years, in the United States:

Year	Tons	Average price
1917	1,295,851	$1.04
1916	859,956	0.62
1915	429,000	0.38

Pennsylvania contributed 1,003,623 tons to the total of 1917, a gain of 49%. Wisconsin sold 222,086 tons.

Condensing Quicksilver From Furnace-Gases

By L. H. DUSCHAK and C. N. SCHUETTE

INTRODUCTION. *The magnitude of the metal losses incident to the condensation of mercury from furnace-gases has been a much-discussed question among quicksilver operators, but aside from the work of Christy[1] at New Almaden, in 1885, no study of this subject has been reported in this country. An elaborate investigation has been made by Castek[2] at the Imperial quicksilver works at Idria, in Austria. No satisfactory application of his conclusions, however, can be made to American practice, owing to the many ways in which it differs from European practice. Metal losses amounting from 30 to 40% have been suspected. Unfortunately lack of technical control in the operations has usually rendered it impossible to set even an upper limit for condenser losses by calculating the gross loss incident to the entire process of ore-treatment. Our investigation was undertaken with a view to making direct quantitative determinations of such losses.

NEW IDRIA QUICKSILVER MINING CO. As over two-thirds of the output is derived from the No. 1 furnace, this was selected for study. It is a Hüttner-Scott furnace, now commonly known as the Scott furnace, with a rated capacity of 60 tons. At present about 70 tons of fine ore and concentrate, making a charge averaging about 1.25% mercury, is treated in 24 hours. Fuel-oil of 18°B. is used, there being two burners in the main fire-box and one in the rear vapor-chamber. The fuel consumption per 24 hours is about 450 gal., or 2.6% by weight of the charge. What is here designated as the 'old' condenser system comprised the customary series of brick and stone chambers followed by eight wooden barrels, then a blower, and a side-hill flue, to the stack. Before the second series of condenser-loss determinations was made, a 'new' system was constructed which retained only the first brick condenser of the 'old' system. This is followed by a line of tile-pipe, then three large wooden tanks in series connected by wooden flues, followed by the eight wooden barrels, fan, flue, and stack of the former system. The fume-cloud leaving the stack with the 'new' system is shown in Fig. 1.

OCEANIC QUICKSILVER MINING CO. Two Scott furnaces, with a rated capacity of 50 tons each, are in use. About 90 tons of ore, carrying 0.25 to 0.3% mercury, is treated in 24 hours. Wood is used as fuel in the main fire-box only, there being no booster-fire in the rear chamber. The total fuel consumption is from 2 to 2.5 cords per day, or, roughly, 3% by weight of the charge. Each furnace is followed by a brick condenser, then a series of brick and wooden chambers, which combine into a common system leading to a side-hill flue and stack.

FIG. 1. FUME-CLOUD FROM STACK

FUME-LOSSES. A preliminary survey showed that the usual methods of sampling employed at lead and copper smelters could not be used without considerable modification, owing to the large amount of water-mist present in the stack-gases. The method here described was developed and first used at the New Idria plant in May 1917. The apparatus used is shown in Fig. 2 and Fig. 3. The gas passed successively through a glass sampling-tube, a short Liebig condenser, a water-cooled bead-tower, a Hawley[3] filter, a wash-bottle, and finally through a small gas-meter to a water-jet pump, which provided the

*Published by permission of the Director of the U. S. Bureau of Mines. This will appear as Technical Paper No. 209 of this Bureau.

The work covered by this paper was conducted by the Bureau of Mines through its Experiment Station at Berkeley, California, in co-operation with the New Idria Quicksilver Mining Co. and the Oceanic Quicksilver Mine. Part of the expense was borne by these companies, and their liberality in placing their plant facilities at our disposal has greatly assisted the work. Thanks are due to H. W. Gould, general superintendent for the New Idria Quicksilver Mining Co., and to Murray Innes, owner and manager of the Oceanic mine. Clifford G. Dennis, president of the St. Johns Mines Co., has also aided in many ways.

necessary suction. The sampling-tube was of glass, 0.15 inch inner diameter, closed at the end, with an opening blown in the side close to the end. This tube was placed with the opening near the middle of the gas-stream and facing the direction of flow. The bead-tower, which followed the Liebig condenser, was of glass (1 in.) inner diameter, and 12 in. long. The upper two-thirds was occupied by solid glass beads supported on a perforated porcelain plate. It is important that this plate be notched at the edges so that liquid collecting on the beads will not be prevented, by the ascending gas-stream, from draining into the reservoir below. Both the Liebig condenser and the water-jacket to the bead-tower were supplied with ice-water or cold tap-water.

The Hawley filter was arranged in the usual way with accurately ground funnels about 3.5 inches in diameter. Soft, rather thick, filter-paper was used. It was found that a section of inner tube from a small automobile tire, placed with the smooth surface next to the glass, gave a firm and absolutely air-tight joint. The wash-bottle was charged with sodium hydroxide solution for the removal of SO_2 before the gas passed to the meter. Considerable CO_2 was no doubt absorbed also. A vertical water-manometer was interposed between the wash-bottle and the gas-meter in order to indicate the reduction in pressure below the atmospheric at which the meter operated. The gas-meter was a standard laboratory instrument made by the American Meter Co. In order to secure a steady and easily adjusted suction, a regulating device was placed in the circuit between the gas-meter and the aspirator. This consisted of a tall glass cylinder with a two-hole stopper. A moveable glass tube for admitting air passed through one hole, and the other carried a T-tube through which the meter and aspirator were connected. Thermometers were placed in the water-jacket of the bead-tower, the gas-meter, and in the stack, carrying the gases under examination.

Point of Sampling. At each plant a point in the flue-system was selected beyond which the amount of mercury recovered was negligible. At the New Idria plant samples were drawn from the 35-ft. wooden stack, a few feet above its base. At the Oceanic plant an auxiliary draft-flue, carrying hot gases from a wood-fire, enters the main three-foot flue a short distance from the stack. Samples were therefore taken from the main flue just before the juncture with the auxiliary draft-flue.

Procedure in Sampling. After the apparatus had been assembled, with the exception of the sampling-tube, the aspirator was set in operation, and by closing the in-take end of the system, a test was made to ascertain that the system was without leaks. Special care was necessary in placing the sampling-tube in the stack or flue in order to avoid contamination by the mercury which coated the interior. Error from this source was avoided by wrapping the sampling-tube in a strip of paper, which was twisted together at the end. The paper-covered tube was shoved partly into the stack or flue and the sampling tube then punched through the twisted end. In removing the sampling-tube the operation was reversed, the tube being drawn well into the paper cover, and the tube and paper then withdrawn together. After the sampling-tube was properly connected, the meter was set at zero and the taking of the sample started by closing a by-pass connected to the suction-line from the aspirator. The suction was so regulated that gas was drawn through the apparatus at the rate of approximately two litres per minute. At this rate the velocity of the gas entering the sampling-tube was roughly that of the gas-stream. In spite of the precautions for stopping the water-vapor and mist, the filter-paper gradually became damp, thus considerably increasing the resistance offered to the passage of the gas. This was in a measure off-set by increasing the suction, which, however, was limited by the fact that the moist filter-paper could not withstand a pressure of more than 4 to 4½ inches of water. The rate of sampling therefore decreased gradually, but in view of the low velocity of the flue-gases, which was less than two metres per second, and the minuteness of the fume-particles in suspension, it seems unlikely that the momentum of any appreciable number was sufficient to cause them to enter the sampling-tube except with the gas-stream. Difficulty due to dampening of the filter-paper was least when ice-water was used in the condenser and jacket of the bead-tower.

At intervals during the period of sampling, the flue-gas, meter, and water-jacket temperatures and the meter and water-manometer readings were recorded. The barometric pressure was also noted, and at least one flue-velocity determination was usually made by the method to be described. The taking of the sample was usually continued until several hundred litres of gas had been withdrawn, or until the rate fell considerably.

The efficiency of the condensing and filtering apparatus in collecting the mercury was tested by placing a second bead-tower and Hawley filter just after the first set in one of the tests. The mercury recovered from the two units was, from the first tower and filter, 0.0199 gm. and from the second tower and filter, 0.0007 gm. From this it is evident that not more than a few percentages of mercury-mist in the fume samples escaped recovery.

Preparation and Analysis of Sample. At the close of an experiment the sampling-tube, condenser-tube, bead-tower, and other parts of the apparatus, including the rubber connections, which might have collected some mercury, were carefully washed with nitric acid. Great care was exercised in this procedure to avoid 'salting' of the sample by mercury-bearing dirt. This was particularly necessary in the case of the sampling-tube, which was thoroughly cleaned on the outside before dissolving the mercury within. The glass beads were cleaned by stirring them in a beaker with hot dilute nitric acid and subsequent washing in a funnel. This operation was repeated at least once.

All nitric-acid solutions that might contain mercury were collected and brought nearly to the neutral point with ammonium hydroxide. Hydrogen sulphide was then passed for some time, the precipitate collected on a filter, and the filtrate again treated with hydrogen-sulphide to make sure of complete precipitation. Any mercuric sulphide in the sample of fume obviously would

not be affected by the nitric-acid treatment, but as the solution was not filtered before precipitation with H_2S, this sulphide would be collected with the precipitated sulphide. The filter-paper bearing the mercuric-sulphide precipitate and the paper from the Hawley filter thus

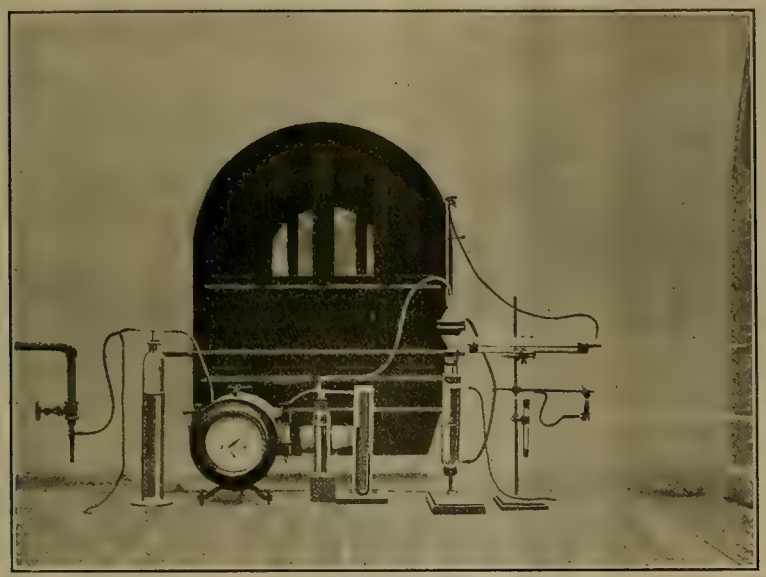

FIG. 2. APPARATUS FOR SAMPLING QUICKSILVER FUME

constituted the sample, which was analyzed by a method developed for the purpose.

DETERMINATION OF FLUE-GAS VOLUME. The low velocity of the flue-gases (less than two metres per second) made the use of a Pitot tube impossible. Attempts were made to determine the velocity by shooting a cloud of colored dust into the gas-stream, but, presumably due to the large amount of water-mist in suspension, the effect at the stack was too slight to be determined with certainty. The problem was successfully met by injecting ten to twelve litres of H_2S at the lower end of the flue and detecting its appearance at the end of a measured length of flue by chemical means. A large rubber bag, with a neck 2 cm. diameter, was placed between two boards, thus forming a sort of bellows, which permitted the injection of the entire volume of hydrogen sulphide within a fraction of a second. The arrangement for detecting the H_2S at the second station is shown in the lower right-hand corner of Fig. No. 3. A glass sampling-tube with several openings was placed well across the flue and a stream of gas was drawn by the aspirator from this through a small gas-washing tube containing 1 or 2 cc. of lead-acetate solution. A fairly concentrated lead-acetate solution, slightly acidulated with nitric or acetic acid, was found to be most sensitive. The timing was done with a stop-watch. It was assumed that the observed velocity was a maximum corresponding to that of the more rapidly moving central core of the gas-stream. The mean velocity was computed[4] by using the

*Distance over which gas-travel was timed was 280 ft. at New Idria and 80 ft. at Oceanic.
†It was assumed that the mean velocity was 0.9 of the velocity observed.

factor 0.9. From the mean velocity so obtained, and the flue-diameter, which was three feet in each case, the volume of gas was computed.

As a check on this method, the volume of gas was calculated from the fuel-consumption and the CO_2 content of the stack-gases, which were carefully observed during a three-day period. This calculation led to a stack-gas volume of 75,800 cu. m. of dry gas at standard conditions per 24 hours. The average derived from three determinations of velocity during this period was 72,300 cu. m. In view of the difficulties involved in determining flue-gas volumes the agreement is considered satisfactory.

Calculation of Results. In calculating the stack-loss from the results of the fume-sampling, the volume of dry gas at standard conditions was used as a basis. The observed volume of the sample, as indicated by the meter, was corrected for the meter-temperature and for the partial pressure of the dry gas. This latter is equal to the observed barometric pressure decreased by the aqueous tension at the temperature of the meter, and by the reduced pressure under which the meter operated, as indicated by the manometer. A further correction in the sense of increasing the volume of the sample by about 4% was necessary owing to the CO_2 and SO_2 absorbed by the wash-bottle that preceded the meter. Similar corrections based on the mean flue temperature, the barometric pressure, and the tension of water-vapor, were applied to the flue-gas volume.

As the sampling procedure did not completely remove all mercury-vapor from the flue-gas a correction based on the vapor-tension of mercury at the mean temperature of the Liebig condenser and bead-tower must be added to the mercury recovered. The earlier values for the vapor-tension of mercury below 100° C., including those of Regnault,[5] which have been used generally in metallurgical calculations, are much too high.

Results. A summary of the determinations of fume-loss is given in Table I.

The losses shown are to be taken as minimum rather than maximum, since such analytical and other errors as were present would be negative. The variation in individual results may be charged only in part to experimental error since the furnace conditions were not constant, particularly at New Idria, where concentrate was fed at intervals.

Using values interpolated from the table of vapor-tensions, given at the close, the total stack-loss may be apportioned between the losses in vapor and in mist. A cubic metre of flue-gas under flue conditions is taken as the unit for the calculations given in Table II.

According to these calculations the gas leaving the old condenser system at New Idria is only half-saturated with mercury-vapor. This may seem surprising but it was due presumably to the large amount of air leaking

into the condenser system at various points, coupled with the slow rate of evaporation from the mercury particles covered with a protecting water-film. A similar unsaturated condition, as regards arsenic trioxide in the flue-gas from a copper-smelter, is noted in Technical Paper

(tierra) furnaces at New Almaden, which received 320.9 kg. of mercury in the form of 1.51% ore per 24 hours, the metal input was accounted for as follows:

	%
Direct yield	92.71
Loss in residue	0.66
Loss in vapor	1.73
Loss in mist (by difference)	4.90
Total	100.00

Taking his figure for the gas-volume leaving the stack at 20° C. as 24,306 cu. m. per 24 hours, the above loss is equivalent to a mercury-content of 0.658 gm. per cubic metre. Of this 0.232 gm. is charged to vapor-loss owing

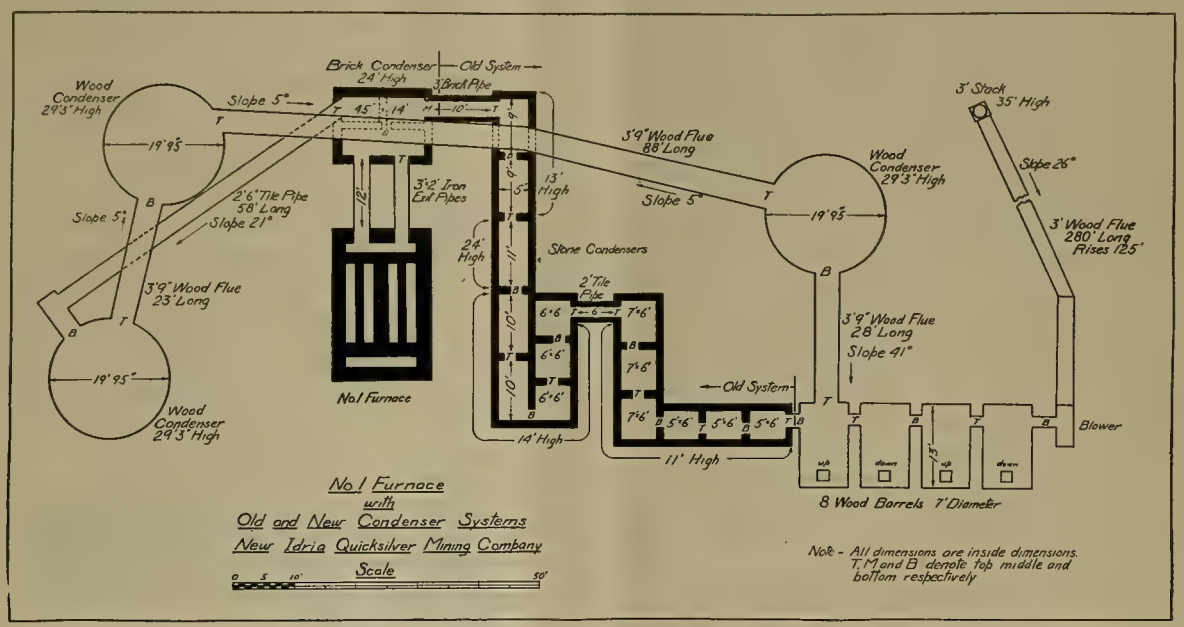

FIG. 4. PLAN OF OLD AND NEW CONDENSER SYSTEMS AT IDRIA, CALIFORNIA

No. 81 of the U. S. Bureau of Mines.[6] It is not certain that in the other cases the stack-gas was saturated with mercury-vapor, although sufficient metal was present for this purpose. That the mercurial particles leaving the stack are largely in the form of free metal is indicated by the following analysis of sludge from the base of the stack. After separating as much free mercury and water as possible by centrifuging, the air-dried residue had the following composition:

	%
Hg (metallic)	64.3
HgS	5.0
Mineral matter (non-volatile)	4.2
Moisture, acid and organic matter (by difference)	26.5
Total	100.00

COMPARISON WITH PREVIOUS RESULTS. From a careful study by Christy[7] of the operation of one of the fine-ore

to the use of what we now know to be an erroneous value for the vapor-tension of mercury at this temperature. The correct value for the vapor-loss, based on the vapor-pressure data given in the appendix, is 0.0132 gm. per cubic metre. No direct determinations of stack-loss were made by Christy, and as the values which he adopted were obtained by difference, it is likely that they include losses occurring in other ways. Inaccuracies in sampling and assaying would also affect his result.

Castek's[8] paper on losses at Idria, Austria, contains, on page 235, a tabulation of stack-loss determinations which indicate an average content of 0.00232 gm. mercury per cubic metre of stack-gas. With a gas-volume of approximately 177,000 cu. m. (stack conditions 15° C. and 724 mm.) per 24 hours, the daily loss was therefore 411 gm., which was about 0.03% of the daily production. It will be noted that the above figure for the mercury-content of the Idria stack-gas is much less than the values given in Table II. Apparently, however, their procedure in sam-

pling, which is only briefly described as a filtration of the stack gas through a plug of glass-wool or asbestos in a glass tube, was designed to stop only the mercury-mist. On page 239, Castek states that a number of attempts were made to detect a vapor-loss, but with uniformly negative results. Apparently the stack-gas was far from being saturated with mercury-vapor. Castek, however, adopts the same erroneous value as that used by Christy in calculating the vapor-loss, and he therefore arrives at a value about 25 times too large.

Although the stack-losses that we found are very small and represent, in the case of New Idria, less than 1%, and at the Oceanic less than 2% of the mercury input, it is instructive to consider whether the relative magnitude of these losses is related to the form of the condenser system used. Fig. 4 shows the old and the new condenser systems of No. 1 furnace at New Idria, and Fig. 5 the condenser system at Oceanic. The old system at New Idria consisted of the conventional brick and stone chambers, followed by wooden barrels and a side-hill flue and stack. In the new system only the first brick condenser was retained. From this, a tile-pipe led to the first of a series of three wooden tanks of about 9000 cu. ft. capacity each. A stream of cold air equal to about one-third of the gas-volume leaving the furnace was introduced into the tile-pipe just beyond the first brick-condenser, as shown in Fig. 6. The 10-in. pipe carrying the air terminated with a 45° bend so that the air-stream was injected parallel to the centre line of the tile-pipe. A water-spray was introduced with the air.

The condenser system at Oceanic consists largely of rectangular wooden chambers. Data pertaining to these condenser systems, which may have a bearing on fume-losses, are assembled in Table III.

system, the equivalent volume of the latter, which is composed of two partly separate systems, is about twice that of the former. The mean stack-temperature at Oceanic is also considerably lower, but in spite of these favorable factors, the daily loss of mercury is a little larger. The number of changes of velocity and direction of the gas-stream is, however, distinctly less at Oceanic.

So far, then, as it is permissible to draw a conclusion from the data presented, it would be that such baffling effect as occurs in the conventional brick or stone condenser system is considerably more effective in recovering quicksilver than a mere increase in condenser volume.

It is obvious, of course, that the gas-volume should be as small as possible. For a given condenser system, other things remaining constant, an increase in the gas-volume will produce more than a proportionate increase in the mist-loss alone, because the higher velocity of the gas-stream will considerably increase its carrying power. Richards[9] states that the carrying power of the gas-stream is probably proportional to the cube of its velocity. The vapor loss, assuming a saturated stack-gas, would be proportional to the volume. As regards vapor-loss, a reduction of the temperature of the stack-gas as it leaves the new system at New Idria to 20°C. would convert nearly three-fourths of the escaping mercury, equivalent to 3.6 kg. per 24 hours, into mist that could be recovered if it were considered worth while to do so. A similar reduction in temperature at Oceanic would convert, roughly, three-fifths of the vapor, equivalent to 1.2 kg. per 24 hours, into mist. The particles of mercury in suspension, as has been suggested above, can be partly removed from the stream of gas by suitable baffling. An elaborate series of experiments upon the separation of suspended particles from the gas-stream

Considering first the old and the new systems at New Idria, the daily loss from the new system was roughly four times that from the old one, although the volume of the new condenser system is more than double that of the old. On the other hand, the factors favoring a larger loss from the new system were a gas-volume 50% greater with a consequent higher mean velocity throughout the condenser system, and a fewer number of changes of velocity and direction in the gas-stream. The final stack-temperature was essentially the same in both cases. Comparing the old system at New Idria with the Oceanic

by different methods of baffling was conducted at the Great Falls plant of the Anaconda Copper Mining Co. several years ago.[10] Taking into consideration the amount of dust collected, the interference with draft, and other important factors, including the cost of construction, it was concluded that baffles consisting of wires

hung vertically a few inches apart were the most effective. In a quicksilver condenser, vertical strips of wood might be used instead of wires.

Without doubt the most effective way of recovering all the mercury in suspension would be through the use of electric precipitation. This method has been employed by the New Almaden Quicksilver Mining Co. in connection with the Herreshoff furnace, both for the removal of dust from the hot gases and for the recovery of mercury-mist from the final stack-gases. The advisability of installing a system for recovering the mercury-mist from the stack gases is a question of practical economics, requiring separate consideration for individual plants.

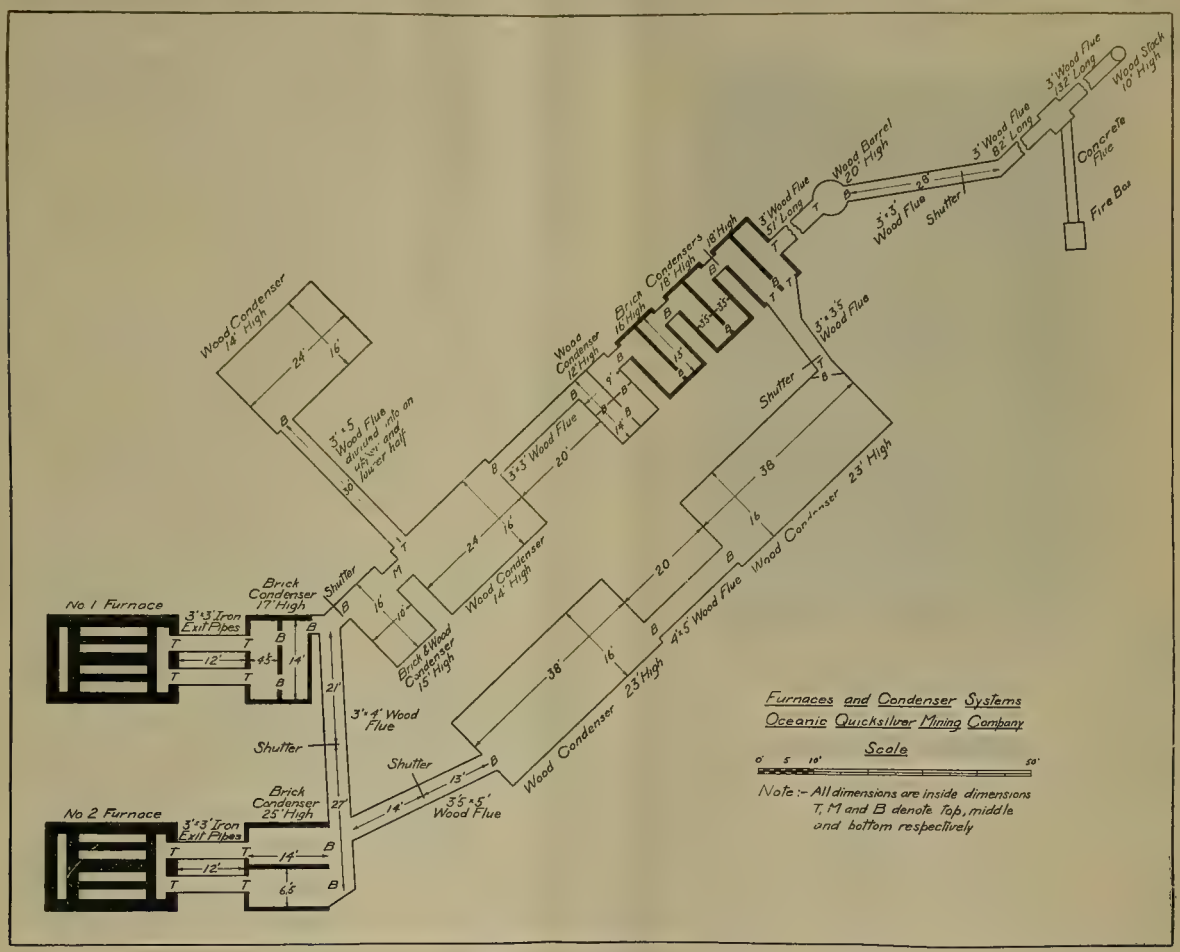

FIG. 5. PLAN SHOWING CONDENSER SYSTEM AT THE OCEANIC MINE, CALIFORNIA

Losses in Water. Water escaping from a condenser system may carry mercury either in the form of minute metallic particles, commonly called 'flowered' mercury, or in the form of mercury salts in solution. Castek concluded that at Idria the loss of mercury in the water leaving the first portion of the condenser system, which was constructed of vitrified stoneware pipes, amounted to about 0.1% of the input, or, roughly, 17 kg. per day. The question of water-losses was taken up coincidently with the stack-loss determinations. With the old condenser system at New Idria (Fig. 4) it was impossible to measure or to sample accurately the water leaving the condenser system, as an unknown amount escaped through the bottom of the brick and stone condensers into the earth. A sample of water, taken shortly after a clean-up and carrying more than the normal amount of mercury, was found to contain 0.15 gm. of mercury per litre. In the absence of a direct determination, the maximum amount of water that might escape from the condenser system was calculated by deducting from the total amount leaving the furnace the portion escaping from the stack as mist and water-vapor. The water content of the stack-gases was calculated from some rough observations taken in the course of sampling the fume. On this basis the waste-water was found to be something less than 2000 litres per day. Taking this as an average, the corresponding loss of mercury is 0.3 kg. per day or 0.05% of the output from the furnace.

In operating the new condenser system, water was sprayed into the gas-stream and also applied to the outside of the wooden tanks and pipe-connections at a number of points. This cooling water, together with that

condensed from the furnace-gases, escaped from the system at two points: that from the first and second wooden condensers (Fig. 4) flowed through a series of launders to a single wooden settling-box and thence to waste; the water from the remainder of the system passed through a long series of launders and then through several settling-boxes.

A number of measurements was made of the volume of water leaving each section of the condenser system under varying conditions, and average samples were taken from each water-stream at the point where it finally ran

FIG. 6. ARRANGEMENT FOR INTRODUCING COLD AIR INTO TILE-PIPE OF THE CONDENSING SYSTEM AT IDRIA

to waste. The results of these observations are given in Table IV. The so-called normal loss was thus 2.19 kg.

Table IV—Water Loss Data, New Condenser System, New Idria

	Conditions	1st sec., tanks 1 and 2	2nd sec., tanks 3 onward
Mercury in solution, gm. per litre.	normal	0.0404	trace
Mercury in suspension, gm. per litre.	normal	0.0412	0.0056
Mercury in solution, gm. per litre.	just after run-down	0.0088	.....
Mercury in suspension, gm. per litre.	just after run-down	0.1395	.....
Volume of water per 24 hr., litres..	normal	26,300	8,770
Volume of water per 24 hr., litres..	maximum	40,900	29,650
Mercury lost per 24 hr., kg.....	normal	2.14	0.049

mercury per 24 hours. To this must be added about 0.5 kg., representing the additional loss occasioned by the agitation during the daily run-down. This leads to a total loss of 2.69 kg. per day. The corresponding loss for the maximum volume of water observed would be about one and one-half times this.

At the Oceanic plant all condenser-water was led to a single settling-tank. A sample of the overflow water from this tank was found to contain 0.018 gm. mercury per litre. With an estimated daily flow of 1500 litres, the loss of mercury would be 0.027 kg. The relatively large loss in the case of the new system at New Idria may be attributed primarily to the increased quantity of water, which was about twenty times that used in either of the other cases. It will be noted that under normal conditions about 50% of this loss was due to metal in suspension, and that during the period of the run-down, the escaping mercury was largely in this form. No doubt a considerable portion of this suspended metal could be recovered by a suitable system of settling-tanks.

The mercury in solution was probably present in the form of sulphate, formed by the action of sulphuric acid on the metal. Mercury can be completely precipitated from solution by scrap-iron, but if the condenser water contains much acid the consumption of iron might be out of proportion to the mercury recovered. At New Idria it so happened that the water supplied to the condensers contains sufficient alkali to neutralize the acid from the

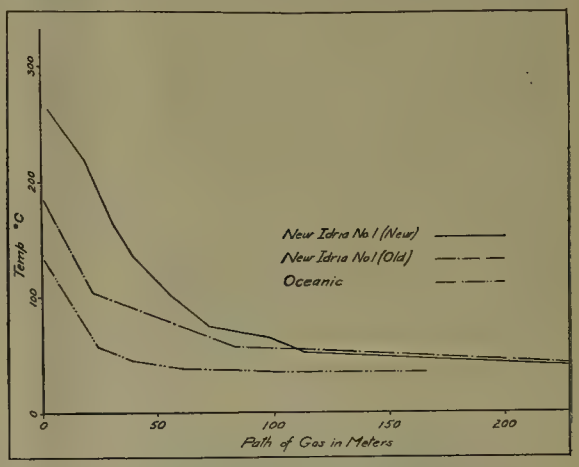

FIG. 7

furnace so that in some cases the water leaving the condenser system was actually alkaline. Under these conditions the wastage of iron should be small.

OTHER CAUSES OF LOSS. Although not susceptible of measurement, certain other ways in which mercury may be lost from the condenser system should be mentioned. It is the usual practice in this country, as well as in Europe, to avoid the danger of losing mercury through gas-leakage by operating the condenser system under a slightly reduced draft. There can be little question as to the wisdom of this procedure, as a slight escape of mercury-laden gas will result in a vastly greater loss than that occasioned by the inward leakage of a like amount of air. For example, the daily leakage of 2500 cu. m. of saturated gas, at 100°C. would result in a vapor-loss of 8.1 kg. and the actual loss would probably be somewhat greater owing to particles of mercury in suspension. This volume is less than 5% of the gas-flow observed at the Oceanic plant. In view of the fact that the inward leakage of air to the extent of 20 to 50% of the gas-stream has been observed at several plants, it is evident that a large loss would result if an equal outward leakage were to occur. The danger of serious loss is greatest close to the furnace where the temperature is high and the mercury content of the gases large. It should be noted that the pressure at the top of any condensing-chamber will be greater than at the bottom, and

that for the taller portions of the condenser system, and particularly for those near the furnace, there may be a considerable difference in pressure. An in-draft at the bottom does not necessarily mean that there is an in-draft at the top. Moreover, owing to the more vigorous air-currents near the top of the condenser system, leaks in this region may not reveal themselves so prominently. All parts of a condenser system should be readily accessible for inspection, and inclined draft-gauges, such as the Ellison gauge, may be used to advantage at danger-points to indicate whether a safe condition of in-draft is being maintained.

Absorption losses include those arising from the penetration of the condenser material by mercury. As was pointed out by Castek and others, this loss is most noticeable with a new condenser system, and the mercury retained by the condenser material is supposed to be eventually recovered. There are, however, certain ways in which losses of mercury can occur through the use of pervious material in the construction of the condenser; these do not appear to have been recognized. We have observed that when, in the course of the periodic 'clean-ups' the interior of the brick condensing-chambers close to the furnace was washed down with water a shower of mercury was apt to fall from the outer surface. This was presumably caused by the expulsion of mercury contained in the pores of the brickwork by steam arising from the water, which penetrated the hot condenser-wall. The same action may take place automatically at certain points owing to fluctuations in the temperature and the moisture-content of the furnace-gases. The phenomenon mentioned supports the common belief that the brickwork of an old condenser system is pretty well saturated with mercury. When this condition exists a considerable surface of mercury may be exposed on the exterior of the condenser system, and where the temperature is high it is not unlikely that considerable evaporation of mercury ensues. The possibility of this is indicated by calculations made from data presented by Knudsen.[11] The amount of mercury that should theoretically evaporate in 24 hours from one square metre of the metallic surface in a vacuum is, roughly, as follows:

Degrees. C.	Kg.
100	10,000
50	480
30	110

This enormous rate of evaporation has been nearly realized in actual experiments in vacuo, but in the presence of other gases the rate would be much less. Assuming that mercury exposed to air will evaporate at only one-thousandth of the above rate, the amount of metal that may be lost in 24 hours per square metre of surface exposed is still considerable. Moreover, the appearance of some of the condenser systems now in use suggests that the surface of mercury exposed in the aggregate may be considerable. These considerations emphasize the desirability of building condensers of material impervious to mercury-vapor.

[11]Knudsen, M. Ann. der Physik. Vol. 47, 1915 (4), p. 697.

Mechanical losses may occur through leaks in the bottom of a condenser system and through spattering during the 'clean-up'. The older practice of building condensers on the ground, or close to it, makes proper inspection impossible, and the considerable quantities of mercury which have been recovered recently from the ground below the foundations of condensers at two plants in California bears eloquent testimony to the necessity for protection against this cause of loss. The practice now favored is to support condensers well above the ground, with properly inclined concrete floors below, thereby diminishing the danger of mechanical loss.

Conclusion. It has been found that the condenser losses that can be measured accurately represent at most but a small proportion of the output of a plant. It should not be concluded from this, however, that the total efficiency of condensing systems now in use is of the order of 95%. The losses mentioned in the last portion of this report undoubtedly have been large at times. The point of fundamental importance established by this investigation is that there are no inherent difficulties to prevent the recovery of at least 96 to 99% of the mercury-vapor entering the condenser system.[12]

The following are average values for the vapor-pressure of mercury after a critical study of several recent investigations.[13]

These are all lower than the old accepted values, the difference being most marked at the lower temperatures.

Vapor-Pressures of Mercury

Temp., deg. C.	Vapor pressure mm. mercury	—Mercury vapor per cu. m.— I—kg.	II—kg.
0	0.000184	0.00000216	0.00000216

200	17.47	0.118	0.210

In the column marked I the figures express the weight of mercury per cubic metre of saturated vapor, measured at the given temperature, and in column II they indicate the weight of mercury required to saturate one cubic metre of gas (air) measured at 0°C. and raised to the given temperature under constant pressure. These values are particularly useful in calculations such as those involved in this paper.

---

[12]Valuable assistance in these investigations was afforded by G. N. Libby and Vance P. Edwardes in the fieldwork, and by W. C. Riddell and C. M. Bouton in the analyses.

Magnesite at Mid-Year, 1918

Steel-makers use large quantities of magnesite brick and granular magnesite to line their furnaces. Magnesite is used also as cement for sanitary floors, as stucco or plaster for exterior and interior walls, and as a non-conductor of heat in pipe and furnace coverings. In these days of large production of steel it is fortunate that we have an abundance of magnesite and are not dependent on a European supply.

According to R. W. Stone, of the U. S. Geological Survey, the production of magnesite in the six months ended June 30, 1918, was 93,700 short tons, of which California produced more than half. According to the best figures available, the Californian output was 47,600 tons of crude magnesite and Washington 46,100 tons. Only two companies were producing in Washington, and one of these stopped quarrying from February to May in order to enlarge its calcining-plant and develop the deposit. The rate of production in California is 50% less than in 1917, and the rate in Washington is 88% of that of last year. The output of California in the second half of 1918 will probably be no larger than in the first half, but that of Washington may be much larger, for development has now reached a stage where rock can be quarried, calcined, and shipped at an increased rate. The production for the entire year may be 225,000 tons, against 316,000 tons in 1917.

The increased freight-rate and the importation of magnesite from Canada have greatly reduced the demand for the Californian ore for use as a refractory material, so that all the small and some of the large producers have stopped work, and the others are operating with reduced force.

Some manufacturers of refractory products in the Eastern States, who used large quantities of Californian and Washington magnesite in 1917 are now using a considerable quantity of Canadian ore instead of the more expensive domestic material. The Canadian magnesite, which comes from Grenville, Quebec, is crystalline, but carries a high proportion of lime. Extensive masses of Canadian magnesite average from 7 to 10% of lime. It can be delivered by boat to Buffalo, Cleveland, and Chicago, at much lower cost than magnesite can be brought from California and Washington, and is being substituted for the higher-grade domestic material. In 1917 we imported 2148 tons of Canadian calcined magnesite, and in the first five months of 1918, 5809 tons. Imports of calcined magnesite from Canada in April 1918 were more than the total imports from Canada in 1917, and the imports in May nearly equaled those of the previous year.

In the summer of 1917 Mr. Stone visited the magnesite field in Washington and many of the fields in California, collecting samples for analyses. Of the 29 samples analyzed, 24 were crude magnesite and 5 were calcined. The results of the analyses made in the laboratory of the Survey are given in the following table (Chase Palmer made the analyses):

	1	2	3	4	5	6	7	8	9	10	11	12	13[a]	14	15

12. White Queen mine, stock-pile.
13. White Queen mine, kilns.
14. Pacific mine, bunker, Red mountain, Santa Clara county, California.
15. Red Mountain Magnesite Co., Butcher mine, bunker, Red mountain, Stanislaus county, California.
16. Butcher mine, cooling-bins.
17. McLaughlin mine, stock-pile on loading-platform, Bradford ranch, Evergreen, Santa Clara county, California.
18. Jackson mine, stock-pile, Cochrane ranch, Morgan Hill, Santa Clara county, California.
19. Warwick mine, lower cut, stock-pile, Madrone, Santa Clara county, California.
20. Warwick mine, upper cut, stock-pile.
21. Hoff-Price Co. mine, stock-pile, Sampson peak, San Benito county, California.
22. Hoff-Price Co. mine, cooling-floor.
23. Northwest Magnesite Co., Finch quarry, five freight-cars, Chewelah, Stevens county, Washington.
24. Northwest Magnesite Co., cooling-floor at kilns.
25. American Mineral Production Co., bunker at Allen quarry, Valley, Stevens county, Washington.
26. American Mineral Production Co., cooling-floor at kilns.
27. American Mineral Production Co., Red Marble quarry, stock-pile.
28. U. S. Magnesite Co., upper 40 ft. of quarry, 18 miles west of Springdale, Stevens county, Washington.
29. U. S. Magnesite Co., 18 ft. in middle of quarry.

This is the largest number of official analyses of Californian and Washington magnesite that has yet been published. Of all the Californian magnesite here shown, that of the White Rock mine, Napa county, is highest in iron content and at the same time reasonably low in silica and lime. Material from two small properties (No. 17 and 18) in Santa Clara county carries as much iron, but one is high in silica and the other is high in lime. The White Rock mine is supplying much of the calcined magnesite used by steel-mills on the Pacific Coast. Some of the Californian magnesite that is high in silica is used for plastic purposes and is said to be satisfactory.

Washington magnesite is crystalline, like marble or dolomite, and unlike the non-crystalline Californian product. Many analyses of Washington magnesite made by reputable chemists have shown 1 to 3% of calcium oxide, 1 to 2% of iron oxide, and silica commonly between 2 and 6%. It should not be concluded from the analyses herewith that the magnesite from the Finch quarry (23) is commonly so low in silica or that from the Allen quarry (25) commonly so high as shown. The magnesite represented by analyses 28 and 29 was considered inferior and production at the U. S. Magnesite Co. quarry discontinued after a few weeks.

Flotation at Mount Morgan, Australia

During the year ended June 2, 1918, the Mount Morgan mine in Queensland produced 17,064,360 lb. of refined copper and gold valued at $1,782,150, from 362,507 tons of ore and 32,945 tons of metal-bearing flux. The concentrator dressed 214,989 tons of the total, recovering 83,567 tons of concentrate. During the second half of the period the following results were recorded:

		Assays		Recovery	
	Tons	Copper, %	Gold, value	Copper, %	Gold, %
Ore concentrated	123,854	2.29	$5.10	....	....
Jigged concentrate	20,508	2.60	$4.10	18.83	13.31
Table concentrate	25,071	3.70	$8.51	32.72	33.79
Flotation concentrate	6,295	18.66	$29.18	41.46	29.09
Total concentrate and average	51,874	5.08	$9.28	93.01	76.19

Mechanical troubles reduced the recovery of copper, when compared with the previous period. Additional grinding machinery is to be put in, tests are being made with the cascade and sub-aeration flotation systems, the settling-area has been extended, and slime is to be retreated. These improvements are expected to increase the recovery considerably.

CALCIUM CHLORIDE is used as the circulating fluid in refrigerating plants, in automobile gas-engine water-jackets to prevent freezing, and, on account of its power of absorbing moisture, for laying dust on roads and drill-grounds, drying gases, vegetables, and fruits, and dehydrating organic liquids. In solution it is especially valuable in automatic sprinkler-systems and in fire-buckets. It is made as follows: After salt, and in some places bromine, has been extracted from brine, the remaining bittern is heated, agitated with milk of lime, and the suspended matter is allowed to settle. The clear liquid is evaporated, and after part separation of the salt the bittern is run to another evaporator and concentrated further. From this pan it goes to a settling-tank where the rest of the salt settles out. The bittern is then boiled in a cauldron and run into metal drums, where it solidifies. It is placed on the market in this form.

Pulverized Coal

*The cost of coal pulverization depends upon the amount of moisture that must be removed before pulverization, upon the cost of labor, and on the cost of coal delivered at the plant. The advantages to be derived from the use of pulverized coal are conservation of coal, reduction of labor by substitution of mechanical devices for manual processes, and an increase in efficiency, since any carbonaceous fuel, from lignite to graphite, can be burned more efficiently in this manner. Coal can be injected into a furnace on a column of low-velocity air without detrimental erosion of the refractory lining. Constant temperatures can be maintained in the furnace, and gas carrying as much as 17% CO_2 can be obtained. For kilns, boilers, and metallurgical furnaces coal containing about 35% volatile matter, 50% carbon, 8% or less of ash, and 2% or less of moisture, are preferable, but with 25% ash and 5% sulphur they cause trouble. The coal should contain 1% or less of moisture, but lignite can be readily handled with 5 to 8% of combined moisture. It should be ground so that 95% will pass a 100-mesh screen and 70% a 300-mesh sieve. On a basis of 200 tons of coal per day, containing 7.5% moisture, and at the present prices of wages, supplies, and coal, the cost of pulverizing will be between 30 and 40c. per ton, not including overhead charges, interest, and depreciation. In transporting pulverized coal, dust must be avoided in order to minimize the risk of explosion. The use of air currents for transportation is bad practice. The feeders must absolutely control the flow of the fuel to the burners, which may be of the inductive or positive type. Lignite and bituminous coal require no special furnace, but fuels low in volatile matter and high in fixed carbon, such as anthracite and coke-breeze, require a furnace in which the incoming fuel and the air pass through the flame, and the products of combustion in a water-cooled, arched, fire-brick chamber on their way to the furnace or boiler. The ash from anthracite, lignite, and coke-breeze does not slag, but the ash of bituminous coal may do so. The ash on the furnace floor should be removed from time to time. Temperatures from 1800° to 3500°F. can be maintained in the flame; slag forms most readily at the higher temperatures. With hand-firing, losses of 20 to 40% of the heat-value of the coal are frequent; producer-gas firing gives a loss of about 30 to 35% of the energy of the fuel; but with powdered coal practically no heat-loss occurs. Savings have been accomplished in the operation of copper-reverberatory furnaces amounting to 30 to 45%.

*Abstract: H. R. Collins, Trans. A. I. M. E., 1918.

Mobilization of Engineers

The U. S. Employment Office, which is a bureau of the Department of Labor, has issued a blank form for registration of technical men of all classes. This was prepared by A. H. Krom, director of the bureau, and is compactly arranged for giving a brief but complete statement of the applicant's experience. In view of the forthcoming registration of all men up to 45 years of age under the pending Man-Power Bill, this blank will be of special interest and value, and it is accordingly reproduced for the benefit of engineers who will be affected by the new legislation. While the country needs fighting men at the front, it also requires a strong efficient force of skilled engineers in the industrial plants that provide the materials essential to military operations, and by the use of this form it will be possible to show succinctly the particular qualifications of such trained men, so that they may be employed where they may render the most useful service. Every engineer should fill out one of these blanks at once and send it to the Director of Engineering, 29 South La Salle street, Chicago, or deliver it to the nearest local U. S. Employment Service office. This will facilitate the mobilization of the Nation's engineering talent.

PLEASE FILL OUT AND MAIL AT ONCE TO DIRECTOR OF ENGINEERING

OATMAN, ARIZONA

Seventeen Months Operation of the United Eastern.

The United Eastern Mining Company has just issued its report for the year ended December 31, 1917, also for five months of 1918. It contains the following information:

J. A. Burgess is general superintendent, with W. O. North assistant; Wallace Keith, purchasing agent; J. W. Bradley, chief clerk; B. D. Boalen, mine foreman, E. M. Bagley, mill foreman; L. E. Ward, master mechanic; B. C. Staiger, mining engineer; and R. G. Davies, geologist.

The gross income last year was $1,830,360. Of this, $633,429 was profit. Six monthly dividends absorbed $408,900. Regular distributions of 5c. per share are now being made. The surplus was $224,529. Current assets totaled $436,546, and liabilities $208,108.

Including 298 ft. of sinking to a depth of 1164 ft., development amounted to 2364 ft. Substantial additions were made to ore-reserves above the 665-ft. level. Further sinking is to be undertaken. Reserves at the end of 1917 were 255,688 tons, valued at $5,830,971. At the Big Jim mine, acquired in April, 854 ft. of work gave favorable results; but exploration has been suspended on account of high costs.

The 200-ton mill was altered somewhat, increasing its capacity to 270 tons. Although fine grinding is necessary—80% through 200-mesh—the ore is readily amenable to cyanidation. There are no interfering minerals. The average extraction last year was 96.33%. The plant treated 84,548 tons of ore averaging $22.42 per ton, extracting 86,629 oz. of gold and 44,353 oz. of silver.

Costs per ton were as under:

Mining	$4.181
Treatment	2.159
Marketing	0.123
Indirect	0.650
Total	$7.113

Additions to plant and buildings cost $46,663.

Mr. Burgess' report under date of July 17, 1918, shows that for the first five months of this year, 39,410 tons of $21.88 ore had been treated. This yielded $548,329 net. Costs totaled $7.23 per ton, but cannot be expected to remain at this figure, on account of increased power and labor charges. No. 2 shaft was sunk to 1177 ft. Driving 500 ft. south on No. 8 level showed the vein not as strong or of as good grade as was expected.

VICTORIA, BRITISH COLUMBIA

Platinum, Manganese, and Gold.—Smelting Rates Raised.

It has been definitely announced by the Hon. Martin Burrell, Minister of Mines for the Dominion, that arrangements have been made with the British government to pay $105 per ounce for Canadian platinum. This is the same as that ruling in the United States, but appreciably higher than the price in Great Britain. It is pointed out that if some action had not been taken in Canada, the efforts of the authorities in developing a supply of the metal might have been somewhat nullified by smuggling it across the United States border, where the price is definitely established.

Some excitement is reported from East Kootenay by the reported discovery of rich platinum and gold placers on Toby creek. There are two parties testing ground, one from Vancouver, the other from Athlamer, the latter town being situated at the junction of Toby creek and the Columbia river. The platinum is said to be flaky, also as nuggets mixed with the coarse gold. High water and rain has delayed development. Residents of the district are hurrying to the place, which is easily accessible.

Mention was made recently in one of these letters to the report that platinum had been discovered by J. Nordquist at the Nome property, Cariboo creek. The first assays made are said to have shown the presence of the metal, but samples sent to the Provincial Analyst failed to disclose platinum. The owner now has taken out a quantity of the ore, divided it into six parts, and intends distributing these specimens among reputable assayers with a view to establishing definitely whether or not he has platinum.

A manganese deposit in the Cowichan district of Vancouver Island promises to prove of considerable importance. Samples tested by the Provincial Mineralogist are said to indicate ore of just the character required. A Vancouver firm's certificate shows 46.20% Mn, 26.92% SiO_2, and 0.064% P; an assay from Seattle reads: 54% Mn, and 18.4% SiO_2. G. C. McKenzie, of the Geological Survey, is making an inspection.

The Consolidated Mining & Smelting Co. has announced further increases in smelting charges. Following is the company's latest statement, dated July 31:

To Lead Ore Shippers:

Since schedule B, lead-ore rates was published, we have been obliged to pay 40c. per ton more for coke to the collieries, which, under that schedule, amounts to an increase of 10c. per ton of ore. In addition to this there may be an increase of freight on coke, but we are not certain yet of this, and there will be a further increase in price effective August 1.

We have been obliged to increase the wages at the smelter by 30c. a shift, so that there is an increase of 45c. per ton under schedule B on this account.

Effective August 1 we will therefore increase the base rate under schedule B by 55c. per ton, plus 25% of the further increase in coke price and freight.

Effective August 12 rates from lead from Tadnac have been increased to $14.30 to Toronto and $16.50 per ton to Montreal. The increase in freight-rate from that which prevailed at February 1 is, therefore, $2.30 per ton on shipments to Toronto and common points and $4.50 per ton to Montreal and common points. Commencing with shipments received here in August we shall be obliged to make an adjustment on account of this freight increase.

As there is considerable difference now between the Montreal and Toronto freight-rates, and it is impossible to forecast the distribution owing to variations in munition demand, we, therefore, as the simplest plan, make this adjustment commencing with the ore received in August, by reducing the lead settlement price by the actual increase in the lead freight-rates.

We will advise you as soon as possible of the amount of the further increases in coke price and freight.

THE MINING SUMMARY

ALASKA

Anchorage.—The Alaska Engineering Commission hopes to connect Seward and Anchorage by rail by September 15. Good progress is being made in spite of the shortage of labor.

Juneau.—Alaska Gold Mines reports as under for the second quarter of 1918, compared with the previous period:

	Second quarter	First quarter
Ore milled, tons	309,249	469,695
Recovery, per cent	81.96	79.92
Gross value, per ton	$1.16	$0.98
Tailing, per ton	0.21	0.19
Recovered per ton	0.95	0.79
Cost per ton	1.00	0.81
Loss per ton	0.05	0.02
Total loss	$14,247	$8,018

The estimate of broken ore in stopes is 1,901,394 tons. Scarcity of labor continues to prevent new development. The plant in all departments is in excellent condition.

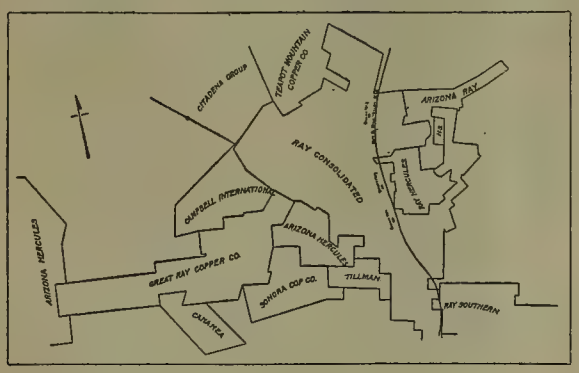
Kennecott.—The Kennecott Copper Corporation pays $1 per share on September 30.

ARIZONA

Bisbee.—Calumet & Arizona pays $2 per share on September 23. This makes $6 for the current year.

Chloride.—J. C. Rankin has taken over the Tintic and the Merrybelle mines. A hoist has been erected at the former. Sinking will commence as soon as the shaft is unwatered. A tunnel is being driven in the Merrybelle.

J. H. Aagard of Los Angeles has taken an option on the Tuckaho mine. A hoist from an Oatman mine is being put up, as well as compressed-air plant.



PROPERTY MAP OF THE RAY DISTRICT, ARIZONA

Geronimo.—The Inspiration Central Mining Co., according to the manager, J. A. Karlson, has opened 20 in. of high-grade copper-silver ore. The mine is in the Turnbull mountains, 10 miles from Geronimo, the shipping point.

The Mt. Turnbull Copper Co., adjoining the Inspiration Central, is to sell shares—to purchase machinery and continue development. C. B. Barnhard of Phoenix is manager.

Ray.—The new mill of the Ray Hercules is concentrating 500 tons daily, about one-third capacity.

Humboldt.—Consolidated Arizona Smelting Co. pays a dividend of 1% on September 14.

Jerome.—The United Verde Extension new smelter is now reducing 400 tons of ore daily.

Kingman.—The Yucca Tungsten Co. is now employing 40 to 50 men, shipping a carload of concentrate every 35 days.

The Standard Minerals Co. is receiving machinery for a 50-ton mill, which is expected to be in operation by November.

Patagonia.—The mill at the Hardshell mine is now turning out 10 tons of manganese concentrate daily.

Tucson.—The secretary of the Pima Smelting Co., G. Meyers, announces that arrangements for the financing of this plant, to be erected here, have been completed, and that the company is awaiting permission from the Finance Board. The plant is expected to be in operation in four months. Contracts for the purchase of 250 tons of ore per day have been signed with local companies.

COLORADO

Central City.—The Gilpin-Eureka Mines Co. continues aggressive development. The main shaft is down 720 ft. below the surface. The new 700-ft. level is being extended on both sides of the shaft, and is now in 250 ft. west and 150 ft. east. Stoping has begun on the 700-ft. level west at the junction of the rich Grabmair stope, which furnished $104 ore on the 600-ft. level. A rich shoot of smelting ore has appeared on the 700-ft. level east. This vein was cut 10 ft. from the shaft, where it was no wider than a knife-blade, but has continued to widen, and is now 15 in. at a point 150 ft. east of the shaft. An average sample was assayed by J. C. Kimball, of Central City, valued at $36.80 per ton, principally in gold and silver, but with profitable quantities of copper, lead, and zinc. Percy R. Alsdorf, of Central City, has been engaged by the company to superintend installation of a flotation plant in the company's mill. A telephone system will be installed in the Gilpin-Eureka, connecting the different working levels and stopes with the shaft-house and manager's office in the mill. E. L. Clark is general manager of the company. A bond-issue of $40,000 is being financed for the company by the Platt Brothers Co., of Cincinnati, Ohio. The proceeds are to be used to install the flotation plant, also to carry on an extensive development program. The main-shaft is to be sunk an additional 300 ft., and the various levels fully opened.

De Beque.—It is reported that there is renewed activity in the oil-shale fields. The American Mineral Oil Co. is arranging to send in plant to its property on Roan creek. ——The Mt. Blaine Oil Shale Co. has built a road, and is excavating for its equipment.——The Colorado Oil Chemical Co. is busy north of De Beque.

Leadville.—Re-opening of the Newell shaft by the C. J. Dold Mining Co. is of importance to this district. With the Northern shaft the company will have two outlets 640 ft. deep. The daily output is 50 tons of lead-silver and manganese ores, mostly the latter; but this is to be more than doubled. Forty-five men are employed.

Ouray.—C. R. Wilfley will continue to operate the Barstow mill here, concentrating fluorspar as well as gold and copper ores.

IDAHO

Metal production of this State in 1917, compared with 1916, according to C. N. Gerry of the U. S. Geological Survey, may be summarized as below:

	1917	1916
Mines producing	359	418
Ore treated, tons	2,758,507	2,718,045
Gold, ounces	38,933	53,977
Silver, ounces	12,029,338	12,300,873
Copper, pounds	7,827,574	8,478,281
Lead, pounds	393,559,521	375,081,781
Zinc, pounds	79,854,136	86,505,219
Total value	$54,845,153	$48,767,783

Shoshone county—the Coeur d'Alene region—accounted for 91% of the total value, followed by Custer with 3%, Lemhi with 1.6%, and Blaine with 1%.

Arco.—The Wilbert Mining Co., operating in the Dome district, 40 miles from here, reports that during the year ended May 16, 1021 tons of lead ore was shipped direct to smelters and 3125 tons milled yielded 893 tons of concentrate. Settlements totaled $133,477. The new incline shaft is down 429 ft., with 135 ft. to connect with an old stope below the 500-ft. level. Eventually the shaft will be 830 ft. deep, and will save $2000 per month compared with the present system.

Mullan.—The Federal M. & S. Co. pays 1¾% on its preferred shares on September 15. This is equal to $209,757, making $629,271 for 1918, and $14,555,723 to date. The total paid to common shares is $2,708,750.

Wallace.—The Hecla company pays 15c. per share, equal to $150,000, on September 28. During the first six months of 1918, sales of ore totaled $2,162,021, of which $1,429,521 was profit, less $290,480 for construction, etc.

KANSAS

Baxter Springs.—The new 300-ton mill (per 10 hours) of the Silver Fox Mining Co. is working well, making a good recovery. Joplin, Galena, and Oklahoma men are interested.

A rich mine is being opened by the Mississippi Queen Mining Co. just south of town. Eleven drill-holes showed ore from a depth of 40 to 120 ft. A shaft is being sunk. Hand-jigs are cleaning some ore extracted. W. H. Berry is manager.

MICHIGAN

Houghton.—Calumet & Hecla reports the following outputs in July:

	July, lb.	7 months, lb.
Ahmeek	1,885,705	15,861,925
Allouez	590,449	4,563,303
Calumet & Hecla	5,284,105	41,376,383
Centennial	193,006	1,525,891
Isle Royale	1,279,579	8,602,675
La Salle	140,706	1,154,350
Osceola	1,398,216	9,698,871
Superior	130,666	1,127,197
White Pine	215,994	1,588,684
Total	11,118,426	85,499,279

Good progress is being made with the Calumet & Hecla flotation plant at Lake Linden.

MISSOURI

Joplin.—Production of the region last week was 5383 tons of blende and 1064 tons of lead, averaging $60 and $100 per ton respectively. The total value was $422,573, making $16,242,872 for 34 weeks. Missouri contributed $111,107 last week.

The Clear-Peacher Mining Co., three miles east, has a richer zinc silicate (calamine) mine than most of this class here. An average of 28 ft. of ore is being mined at a depth of 107 ft. Timber for underground is cut on the lease. A 100-ton mill is producing 16 tons of 43.2% zinc concentrate daily, selling for $43.50 per ton. Fletcher Clear is in charge.

Oronogo.—One of the largest concentrating plants in the United States, that of the Connecticut Zinc Corporation on the Oronogo Circle mine, is almost ready for work. On the 240-ft. level of the mine is a No. 8 McCully gyratory crusher, capable of breaking a 20-in. piece of ore. A shovel with 2½-ton dipper fills the 5-ton side-dump ore-cars underground. According to the Joplin 'News Herald', the new mill is of 2500 tons capacity in 24 hours and is equipped as follows: Two 24-in. Webb City-Carterville crushers, two sets of 60-in. rolls, four sets of 40-in. high-speed rolls, eight Akins classifiers, nine jigs, two six-cell roughers, two four-cell bull-jigs, two five-cell secondary roughers, one seven-cell sand jig, two six-cell cleaners, 27 sludge-tables, five Dorr thickeners, and a complete oil-flotation plant. This equipment is arranged with the idea of handling the ore only once and the Akins classifiers direct the different sizes to the proper machines. The power-plant consists of 900 hp. of steam and 1250 hp. connected load of electric power. The mill proper is driven by a 500-hp. Corliss steam engine, and the sludge room is driven by a 200-hp. motor. There are five Scotch-marine boilers, aggregating 625 hp. All ore is crushed underground to pass a four-inch ring and hoisted in a shaft that contains two skip-ways and one man-way. Skips have a capacity of five tons each. Ore is then conveyed to a 2500-ton hopper by means of a belt-conveyor. From this hopper it is again conveyed to the mill by a similar conveyor. Locomotives are being used underground for tramming and a 1000-ton hopper has been constructed underground to take care of the crusher output. A sludge-pond has been constructed to cover 100 acres of ground with a body of water 4½ ft. deep. The mill was expected to be ready by about August 20.

MONTANA

Butte.—The president, A. J. Seligman, of the Butte Copper & Zinc Co. states that the July production of manganese was over 9000 tons, the largest to date. Zinc-ore production

NEW 2500-TON MILL OF CONNECTICUT ZINC CORPORATION AT ORONOGO, MISSOURI

was 2000 tons, higher in zinc, lead, and silver content than in previous months. August so far maintains the above rate of shipments. The reduction in the freight-rate on manganese ore ordered by the Government recently, will be of great benefit to this company.

Cooke.—Shareholders of the Montana Scotch Bonnet company, mostly Spokane men, will get $150,000 as the result of a deal consummated, at which Robert McKay of Livingston, the purchaser, paid $1000 to bind the bargain. Payments extend over a period of five years. The disbursement will be about five cents per share. This property has been quite inaccessible. It is understood that a railroad is to be built from Gardner through a corner of Yellowstone Park to Cooke and that the building of the line and securing these options for mines are contingent. The Scotch Bonnet will be reached by about 60 miles of the road.

NEVADA

Goldfield.—The manganese property of J. Gaillac and M. Kusick on the Lida road, 7 miles south of Goldfield, has been purchased by Carl Fuetsch through A. E. Barnes. A large deposit of high-grade ore is said to exist.

Luning.—Midway between this place and Hawthorne, F. B. House is mining barium. So far he has shipped 1250 tons, selling for $4.50 per ton on cars at Kinkead siding. Work is conducted to a depth of 30 ft. The vein is from 2 to 7½ ft. wide. A mile and one-half from this mine the Nevada Ore & Copper Co. has a 100-ton mill treating gold-copper ore. Old tailing amounting to 16,000 tons is to be treated.

Thompson.—The Mason Valley company's copper output in July was 1,190,177 pounds.

Tonopah.—During July the Extension treated 9520 tons of ore, yielding 115,215 oz. of silver and 1101 oz. of gold. The profit was $45,542.

Last week the Belmont shipped 93,457 oz. bullion and 32 tons of concentrate, valued at $128,000.

A rich streak of ore is being followed on the 850-ft. level of the North Star.

The Rescue has opened two veins at 1050 ft. On the foot-wall vein a 30-ft. winze has followed 2 ft. of ore, assaying from $80 to $150 per ton.

All lessees in the Montana are doing well, and the company finds this the most satisfactory way of working the mine at present.

OKLAHOMA

Miami.—Following the decision to form an ore exchange here, three or four ore warehouses are to be built, costing over $80,000. They will be equipped with weighing apparatus and conveyors to load cars quickly. The first warehouse, at Picher, will be finished within 40 days.

Picher.—Production of all districts last week totaled 2969 tons of blende and 873 tons of lead, valued at $268,626.

UTAH

Metal production of Utah in 1917 reached the high value of $99,328,000, according to preliminary figures just made public by the U. S. Geological Survey. This is a record for the State. The shipment of ores and concentrates during the first six months of 1918, according to V. C. Heikes, were, however, less than those of the corresponding period in 1917. Production was affected by severe winter weather, higher costs, shortage of labor, and smelter embargoes. The prices of metals, except silver, were lower than in 1917. Larger shipments were being made from Beaver county and from the Park City region in the first half of 1918 than in the later part of 1917, but decreases are noted from Tintic and Bingham. The mines at Park City were shipping 9000 tons of crude ore and concentrate per month during the early part of 1918. In the Tintic district shipments decreased to about 28,000 tons. The increase in the output of lead at Park City may offset the decrease in that of the Tintic district. Most of the lead produced in Utah comes from Bingham, where no increase has been made in 1918. The prospect is not favorable for an increase in the output of zinc. The four smelting plants in Utah are active, but apparently no effort has been made to increase the present rate of shipment of ore.

Alta.—Michigan-Utah shipped 34 cars of ore up to the third week in August, 28 being by the Triangle Leasing Co. The first manganese has been sent out, this carrying 41.92% Mn.

Eureka.—The Chief Consolidated, in the second quarter of 1918 made a net profit of $294,100. Dividends this year total 32½c. per share, equal to $287,372. All development amounted to 2693 ft., one the 1000, 1600, 1800, and 1900-ft. levels. Generally, results were satisfactory. Diamond-drilling is under way from the surface. A new 3-compartment shaft is being sunk 3600 ft. east of the present shaft. Shipments consisted of 9057 tons of lead ore, 8550 tons of 'dry' ore, 26 tons of zinc ore, 217 tons of zinc-lead ore, and 189 tons of manganese ore. Excluding the manganese, the average value was $48.19 per ton. Cecil Fitch is superintendent.

Fish Springs.—The new 200-ton mill of the Utah Mine Co. here, in Juab county, will be working by mid-September. H. Linke is superintendent.

Monroe.—Manganese deposits near this place in Sevier county, and near Marysvale in Piute county, were recently examined by V. C. Heikes of the U. S. Geological Survey. These deposits lie along the eastern boundary of Sevier valley, at the base of Sevier plateau, which is underlain by igneous rocks, chiefly Tertiary tuffs and lavas. The Loring deposit is 6 miles south of Monroe, near the base of Monroe peak. The nearest shipping point is Elsinore, on the Denver & Rio Grande railroad, 8 miles distant. Nine carloads of ore were shipped from this place in 1916 to smelters at Dunbar, Temple, and Washington, Pennsylvania. Assays of two carloads of the ore showed that it contained 35% manganese, 6.6% silica, and 8.57% of iron. The ore occurs in cracks and crevices of weathered igneous rock, and has been obtained by stripping the overburden from an area 600 ft. long and 200 ft. wide to a maximum depth of 16 ft. The deposit may extend several thousand feet north and south beyond the open pit, for rich float was found on the surface through this distance. The ore is soft and is probably wad, a mixture of manganese and iron oxides. Small lenticular masses of manganese and iron oxides in tufa have been found a short distance east of Monroe but have not been mined. The deposits were probably formed by hot springs. Near the mouth of Manning canyon, 10 miles south-east of Marysvale, there is a deposit of manganese ore, owned by Krotki & Sandberg, of Marysvale. The ore is exposed in four open-cuts, but no ore has yet been shipped. The outcrop of the ore strikes N. 65° W., and can be traced for 400 ft. The enclosing rocks are lavas of several varieties, but most of the ore is disseminated through a flow of rhyolite that ranges in thickness from 8 to 30 ft. The principal manganese ore is probably manganite, which occurs in small prismatic crystals, but another form of ore, psilomelane, is disseminated through the rhyolite in veinlets and bunches. The ore is accompanied by calcite and must be concentrated to obtain a marketable product. Water and electric power are available nearby. Small shipments of manganese ore have been made from a deposit near Junction, Piute county, and from a deposit near Pahreah, Kane county, Utah. No detailed information concerning these deposits is yet at hand, but as the cost of hauling ore from Pahreah to the railroad is said to have been $30 per ton the prospect of exploiting them with profit appears small.

Promontory.—The Lake View Mining Co. is again mining zinc and zinc-lead ores. The total output to the time of suspension of shipments was 14,000 tons. Dividends amounted to $137,000.

Tintic.—Twenty mines last week shipped a total of 158 cars of ore.

The Dragon Consolidated earned $9000 last month. The Tintic Milling Co. has a lease on part of the property.

The Tintic Standard continues to open new orebodies, the latest being on the 1300-ft. level.

The North Beck company's shaft is down 1200 ft., where a station is being cut.

The Apex Standard is ready to sink a new shaft at the eastern end of the district.

The Empire has opened new ore on its 1800-ft. level.

WASHINGTON

Chewelah.—The United Copper Co. has made a three-year contract for the smelting of its ores by the Tacoma smelter. According to the president, Conrad Wolfle, it is a contract that will ensure the company good smelter returns whether the War continues or stops. One of the big expenses connected with the company's dealings with the smelter at Trail was the heavy exchange-rate on money between Canada and the United States. This is now avoided and the bother of getting a license to export products is eliminated.

Spokane.—Continued development of magnesite properties, steady shipments of copper, lead, and silver, accompanied by discoveries of tungsten and chrome, all in Stevens county, have stimulated mining activities in all portions of this county, whose richness is just beginning to be realized. Attention has recently been directed to the Deer Trail section in the south-western part of the county, where two companies are shipping steadily and a third expects to be doing so early in August. One truck is making two trips daily from the High Grade mine, owned by the Reardan Copper Co., hauling 3 to 3½ tons per load. The distance to the logging road is 10 miles. The ore goes to the smelter at Trail. Two trucks are hauling from the Deer Trail day and night, making eight trips per day, hauling 3 tons per load. The distance is 12 miles to the logging road. The Bonanza, continuing its cross-cut, has driven 200 ft. since last fall, and is now in 715 ft. from the portal. A 4-ft. vein of ore has been disclosed, assaying $25 to $30 in copper.

CANADA

British Columbia

Anyox.—Granby Consolidated produced 2,167,077 lb. of copper in July, a reduction of 1,300,000 lb. when compared with June, due to the strike. The first converter here has been at work for several weeks, and another is being erected.

Yukon

Dawson.—The 'Daily News' issued its 21st anniversary number on August 17. This contained interesting features of life and mining in the Klondyke. A full description is given of operations conducted by the Yukon Gold Co., also by the Canadian Klondyke Mining Co. Although the temperature was 50° below zero, No. 2 dredge of the latter company worked through last winter.

MEXICO

Sonora

Cananea.—This State is estimated to have produced 10,000,000 lb. of copper in July. Of this, Greene-Cananea contributed 5,000,000 lb. and the Moctezuma 4,000,000 lb. Apart from the difficulty in getting food and supplies, conditions in the copper centres are reported to be satisfactory.

Tigre.—The North Tigre company has ordered a 50-ton concentrating plant to treat the gold-silver-copper ore. F. H. Holmes represents the lessees.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

W. W. Wishon is at Bozeman, Montana.

Charles E. Knox is at Tonopah, Nevada.

F. Lynwood Garrison is at Rock Springs, in Maryland.

W. de L. Benedict has returned from San Francisco to New York.

Percy Williams has returned from Washington to Silverbell, Arizona.

Lewis P. Shackelford, of Juneau, Alaska, is at the St. Francis hotel.

Sanford Rudolph has enlisted in the Engineer Corps and is now in France.

Victor Rakowsky, of Joplin, is here. He is exploiting a chrome deposit in northern California.

Lester C. Uren is Captain in the Chemical Warfare Service of the A. E. F., and is now at New York.

John F. Beavis, operating mines in the Philippine Islands, is residing temporarily at Berkeley, California.

W. H. Emmons, Jr., is Operations Director of the Government's nitrate plant at Muscle Shoals, Alabama.

Philip N. Moore returned from Alaska in time to attend the meeting of the Institute at Colorado Springs.

Sir **John W. Carson**, president of the Crown Reserve Mining Co., recently inspected the Alice property at Idaho Springs, Colorado.

Charles W. Merrill is here on a visit from Washington, where he is Chief of the Collateral Commodities Division of the U. S. Food Administration.

W. H. Blackburn, superintendent for the Tonopah Mining Co., returned last week to Tonopah from a visit to the company's Eden mine in Nicaragua.

Corey C. Brayton has returned from Salt Lake City to San Francisco to take the examination for a commission in the Engineers Corps of the Army.

Edwin Young has been appointed welfare engineer for the Great Falls reduction works of the Anaconda company. He has given 28 years service to this plant.

J. P. Montague has resigned from the Union Amalgamated Mining Co., at Manhattan, Nevada, to take a position with the Ray Consolidated Copper Co. at Hayden, Arizona.

Courtenay De Kalb attended the Gold Conference of the Northwest Mining Association as a delegate from the American Gold Conference, held recently at Reno, Nevada.

Manuel Eissler, on his return voyage to Hongkong, suffered a paralytic stroke and is now in the Chefoo hospital at Shantung, China. We are glad to add that he is recovering from the shock.

J. C. Nicholls, superintendent of mines for the International Nickel Co. of Canada, accompanied by **J. W. Rawlins**, metallurgist to the same company, are inspecting copper-concentrating plants in Arizona.

F. A. Malins, mill-superintendent for the Dos Estrellas Mining Co., at El Oro, Mexico, has returned to his work after two months spent in a Mexico City hospital followed by three months at Corpus Christi, Texas.

Victor G. Hills is engaged with the engineers of Summit and Eagle counties, Colorado, in extensive surveys of the mountain ranges dividing the waters of the Arkansas, Platte, Eagle, Ten Mile, and Blue rivers. He is now at Leadville.

F. H. Flynn, general superintendent for the Smelting & Refining Departments of the Consolidated Mining & Smelting Co. of Canada, Ltd. at Trail, B. C., has resigned. Mail addressed care of the American Institute of Mining Engineers, at New York City, will be forwarded.

THE METAL MARKET

METAL PRICES

San Francisco, September 3

Aluminum-dust, large and small lots, cents per lb	65—70
Antimony (wholesale), cents per pound	16
Copper, electrolytic, cents per pound, in carload lots	26.00
Copper, electrolytic, cents per pound, in small quantities	27.35
Lead, pig, cents per pound	8.30—9.30
Platinum, Government price, per ounce	$105
Quicksilver, per flask of 75 lb	$120
Spelter, cents per pound	11
Zinc-dust, cents per pound	17½

ORE PRICES

September 3

Antimony, 45% metal, f.o.b. California, per unit	$1.10
Chrome, 38 to 48%, California, per unit	$1.25—$1.50
Fluorspar, 85% CaF_2, f.o.b. shipping point, or San Francisco, per ton	$22—$30
Magnesite, crude, California, per ton (nominal price)	$7.00—8.00
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 45%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 85% MoS_2	$1.00
Pyrite, per unit of sulphur, cents	28—32
Tungsten, 60% WO_3, California, per unit	$20—$25

EASTERN METAL MARKET

(By wire from New York)

September 3.—Copper is unchanged. Lead is scarce, but without change. Spelter is inactive and easier.

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government has fixed its maximum at 49½ pence.

Date	New York, cents	London, pence

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.35c., respectively, until August 15. On August 7 the current rates were again fixed until November 1, prices to be effective on the day of shipment, not the day of sale.

Quotations in cents per pound are as under:

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. This is to be continued until January 1, 1919, the price at point of delivery to be at East St. Louis plus freight. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

Zinc-ore prices were stronger at Joplin, Missouri, last week, when second-grade concentrate sold for $55 per ton, a gain of $2.50. A car shortage rather held back prices.

LEAD

Lead is quoted in cents per pound, New York delivery. Government metal receives 7c. per lb. until August 6. Early in July producers agreed to fix prices at 8.05c. per lb., New York.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefor $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds.

ORES (New York)

Antimony: This market is devoid of development.

Ferro-manganese: The War Industries Board is seriously considering the limiting of the number of blast-furnaces now making ferro-manganese and turning these over to making pig-iron, which is very scarce. It is planned also to encourage the production of electrolytic ferro-manganese by providing sufficient manganese ore, of which there appears to be plenty. This will be of interest to Pacific Coast smelters. There are now four companies producing electrolytic ferro-manganese in the country, two on the Pacific Coast, one in Colorado, and one in Alabama. The output of domestic ferro-manganese in July, according to 'The Iron Age,' was 31,400 gross tons, the second largest month on record, May having shown 35,790 tons. The spiegeleisen output was 20,362 tons in July, a record for the year. 17,844 tons having been made in May.

Manganese: Brazilian ore, about two cargoes, has sold at $1.35 per unit, which seems to be the maximum quotation, as no higher bids were obtainable. A cargo of Indian ore reached this market last week, some sold months ago.

Molybdenum: Quotations remain nominal at $1 per lb., with improved inquiry.

Tungsten: Consumers are in the market for delivery during the remainder of this year and into 1919, but are reported as not very successful in placing orders. There has been a fair business in spot delivery. High-grade ores have brought $25 to $25.50 per unit, with low-grade ores down to $20. Ferro-tungsten is quiet, most consumers being well covered. Quotations range from $2.35 to $2.45 per lb. of contained tungsten.

Eastern Metal Market

New York, August 28.

All the metal markets are still strong though quiet, with copper, lead, and aluminum prices under control.

The demand for copper, as new inquiry, has slackened.

Tin is declining slowly, but is still scarce and firm.

There is a serious shortage of lead.

Zinc is less active, but has advanced.

Antimony is strong and higher.

An imperative appeal has been made to the steel industry in the past week by the War Industries Board for rails, plates, and shell-steel. Unexpected needs of France have added to the stringency, so that the total finished iron and steel estimated as needed in the last half of 1918 is now 23,000,000 tons, against an estimate of 20,000,000 tons a month or so ago, and a probable production of 17,000,000 to 18,000,000 tons for the last half. The recent aggressive activities of the Allies have increased the necessity for more steel. Added to these facts are calls from England, France, and Italy for heavy pig-iron shipment in 1919, concurrent with an acute scarcity in America. Great Britain wants 1,000,000 tons more, of which she is likely to get but little. To make more shell, ship, and rail-steel, some pipe, sheet, and wire mills may have to cut their output. After much discussion an agreement has been reached on rail prices. A flat price of $55 per ton for bessemer, and $57 for open-hearth, may be settled on, subject to change October 1.

COPPER

After the large volume of buying for delivery up to November 1, the time set for the continuance of the 26c. price, there has been relatively little demand. Contracts are reported to have been made for delivery in November and December, but they do not involve large quantities, and are to be only at the price ruling at that time. These are the only news features of the market. A factor on future business is the statement that the U. S. Steel Corporation has placed orders for $5,000,000 worth of electric equipment for its Neville Island gun and projectile plant. This, of course, means a large consumption of copper. Production in July—167,000,000 lb.—was lower than that of June, 175,000,000 lb., due largely to shortage of labor.

TIN

The market has been sagging daily during the past week, and every selling position has been affected. The causes are the fairly large arrivals and the distinct absence of buyers. They manifest no interest, due largely to their desire to await the result of the London conferences, already referred to in these letters. No news regarding this convention has been published yet. An instance of the lower tendency is the fact that October shipments from the Straits is now offered at 78c., compared with 81c. a week ago, 84 to 86c. some weeks earlier, and 97c. per lb. at the peak of the advance some months ago. Even spot or prompt metal is easier, due to the recognition of those having it, which are few, that the market as a whole is lower. For prompt metal the nominal quotation yesterday was 88c., New York, against 92c. a week ago; but little is available. Banca and Chinese brands are held as high as $1 per lb. One large dealer remarked that such holders might have to "eat the metal" ultimately if they persist in their present course. Arrivals at Pacific ports so far this month have been 3425 tons, and at Atlantic ports 2475 tons. The London market is also declining, spot Straits being quoted at £367 10s. per ton yesterday, or £14 per ton lower than a week ago.

LEAD

The scarcity of lead has been mentioned frequently in these letters of late; the situation is acute. So scarce is the metal that August and September delivery are practically unobtainable. Production is not equal to demand, and has not been for some time. An authority states that the output in the first half of 1918 was only 266,874 tons, antimonial-lead included, this comparing with 563,000 tons in the calendar year 1917, and with 570,000 tons in 1916. That these facts are unquestioned is corroborated by the action taken in the past week by the lead committee of the producers, which has been the event of the past few days. Requesting the co-operation of all dealers and manufacturers, the committee's announcement urges strongly the elimination of all non-essential uses of the metal, the discontinuance of accumulations of unnecessary stocks, etc. No pig-lead is to be sold by producers for re-sale in carload lots, and re-melted scrap is not to be sold at higher prices than the current market for virgin metal. It is also stipulated that retail dealers are to be supplied only with the understanding that they are to re-sell to customers whose requirements are in their judgment essential, limiting the price of such sales to ½c. per lb. above the ruling wholesale price. This last stipulation is not satisfactory to dealers who claim that their margin of profit, after costs of storage, haulage, etc., are paid, is too small. It is evident that either consumption must be curtailed or production increased. To accomplish the latter will require several months.

ZINC

The upward movement that started a week or 10 days ago has continued, and yesterday prime Western was quoted at 9.25c., St. Louis, or 9.50c., New York, for September, with October held at 9.12½c., St. Louis, and last quarter at 9c., St. Louis. There have been sales in considerable quantities of prime Western for most of these positions, but in the last day or two demand has slackened perceptibly. Whether the peak of this movement has been reached is a matter of speculation, but it is not unlikely that a slight setback may now appear. But 10c. zinc is not unexpected before the end of summer. The technical position is strong. The Government weekly statistics show a small increase in stocks of the higher grades for the week, and a small decrease in those of prime Western. Government maximum prices for grade A have been continued from September 1 to January 1 at 12c. per lb. with sheet and plate zinc also unchanged for that period at 15c. and 14c. per lb., respectively.

ANTIMONY

The market is decidedly stronger and higher. For prompt or early delivery, New York, duty paid, 14.25 to 14.50c. per lb. is quoted. One cause is the large purchase by Japan of Japanese and Chinese metal, which is said to be selling higher there than in New York.

ALUMINUM

As a result of a meeting in Washington during the past week, maximum prices for No. 1 virgin metal and for scrap have been continued unchanged from September 1 to March 1, 1919. These are 33c. per lb. for 50-ton lots, 33.10c. per lb. for 15 to 50-ton lots, and 33.20c. per lb. for 1 to 15-ton lots. Demand for airplane construction is reported as large, and it is understood that the Aluminum Co. of America recently successfully appealed to the Canadian government to permit it to build an ice barrier in the south branch of the St. Lawrence river at Massena, N. Y., so that production of the metal might continue during the winter.

Company Reports

NEW CORNELIA COPPER CO.

Property: mines and treatment plant at Ajo, Arizona.

Financial Statement: income in 1917 totaled $3,810,123, nearly all from metals. Operations cost $2,007,840, and taxes $128,644. After deducting $911,229 for depreciation, etc., the net income was $762,411. Current assets total $2,297,004, and current liabilities $983,907.

Development: during the year the Ajo Consolidated property was absorbed, increasing ore-reserves considerably. These are now:

Class of ore	Tons	Copper, %
Oxide	12,800,569	1.568
Sulphide	40,302,457	1.587
Total and average	53,103,026	1.582
Ore mined	840,424	1.803
Net reserves	52,262,602	1.579

Production: on June 18, 1917, the first shipment of electrolytic copper left Ajo, and the output for the period was 12,764,848 lb. of electrolytic, 3,316,283 lb. of cement copper, and 3,401,060 lb. of metal in ore, a total of 19,482,191 lb. This was contained in 780,211 tons of ore.

NEW YORK & HONDURAS ROSARIO MINING CO.

Property: silver-gold mines and mills at San Juancito, Honduras, Central America.

Operating Officials: A. R. Gordon, general manager; F. L. Pearce, mine superintendent.

Financial Statement: the 37th annual report, for 1917, shows an income of $1,676,846. Of this, $506,874 was profit. Current assets total $1,505,209, and liabilities $567,784.

Dividends: six, No. 206 to 211, equal to 15% on the capital, amounted to $300,000. No. 1 amortization distribution was made, 5%, equal to $100,000. Total dividends are $4,490,000.

Development: the footage was 9381 ft., a decrease of 3257 ft. when compared with that of 1916. The cost per foot was $12.21. Over a third of this work was on the San Miguel vein, with gratifying results. About 20 veins are worked, the San Miguel North being the largest producer in 1917. Reserves are estimated as 303,296 tons averaging $9.21 per ton, including broken ore and vein fills, a decrease of only 8847 tons. Development was done on three outside properties. A mill is being erected for one. Electric haulage in the main property, with six locomotives, is entirely satisfactory. Hammer drills have replaced the piston type for development.

Production: the twenty 1850-lb. stamp-mill and cyanide plant treated 125,900 tons of ore, averaging $9.84 per ton. Silver extracted was 1,670,612 oz., and gold 13,790 oz., the extraction being 88.31% and 94%, respectively. The total value was $1,111,112, making $24,400,276 since 1882.

Costs: these totaled $7.43 per ton, an increase of $1.13.

WAIHI GOLD MINING CO., LTD.

Property: mines and stamp-mills at Waihi; railroads, mill at Waikino; hydro-electric power-plant and 50-mile transmission-line, in New Zealand.

Operating Official: E. G. Banks, superintendent; W. P. Gauvain, assistant; James Gilmour, mine superintendent.

Financial Statement: receipts from gold and silver, and sundries in 1917 totaled £391,111 ($1,877,000). Operations and administration cost £197,211 ($946,000), leaving a profit of £193,901 ($931,000). With the previous balance there was available £229,252 ($1,099,000), from which was deducted dividends, income-tax £48,248 ($230,000), depreciation, etc., leaving £52,435 ($298,000) carried to 1918. Investments—market-value—are £416,268 ($1,997,000).

Dividends: four, No. 95 to 98, amounted to £99,181 ($475,000). Two dividends, equal to $237,500, were paid in 1918 up to June. Total to date is $24,000,000.

Development: new work amounted to 9249 ft., a low footage due to labor and supply conditions. No work is being done below No. 11 level. Ore is being mined from arches. Reserves total 653,716 tons, a decrease of 110,913 tons. The Cornish pump raised 69,478,500 gal. and the electric pumps 403,791,265 gallons of water.

Production: 200 stamps, 11 tube-mills, sand, slime, and concentrate plants treated 191,742 tons of ore. An average of 121 stamps worked 296 days, also 7.2 tube-mills. The ore assayed 33s.3d. ($7.98) gold and 6s.9d. ($1.62) silver, at total of £2 ($9.60) per ton. Extraction was 93.3% of the gold and 80.3% of the silver, equal to 91.1% of the total value. Concentrate assayed 9 oz. 2.5 dwt. gold and 46 oz. 10 dwt. silver per ton. Extraction from this was 98.1%. Precipitate melted—54,843 lb.—yielded 634,544 oz. of doré bullion, which when refined, yielded gold 999.5 and silver 996 fine. Sales totaled £370,567 ($1,777,000), making £11,878,706 ($57,020,000) since 1890.

BRADEN COPPER CO.

Property: mines, mills, and smelter in Chile.

Operating Officials: S. S. Sorensen, general manager; L. E. Grant, assistant; H. R. Graham, mine superintendent; J. Chambers, railroad superintendent; R. E. Douglass, mill superintendent; W. L. Stevens, acting smelter manager.

Financial Statement: operating revenue in 1917 was $13,041,925, and expenditure $6,699,726, leaving $6,342,199. Other income was $876,937. Taxes and interest absorbed $1,110,749, and other charges (depletion, depreciation, etc.) $3,245,276. The net surplus for 1917 was therefore $2,863,111, plus $406,621 from reserve no longer required and steamship profit, and $6,738,705 balance from 1916. The total of $7,145,325 was reduced to $2,193,628 by depletion adjustments, etc. Adding this to the 1917 surplus above, the balance at December 31, 1917, was $5,056,739. From this is deducted $1,170,000 for discount on bonds, leaving a net earned surplus of $3,886,739.

Development: new openings in the Teniente amounted to 31,135 ft., making 96,195 ft. to date, and 11,868 ft. in the Fortuna, making 130,963 ft. By the end of July 1918 the new main shaft, known as A, is expected to be completed. Development gave very satisfactory results. Reserves are estimated as 149,192,000 tons of 2.42% positive ore and 90,000,000 tons of 1.88% probable ore. This is an increase of 19,512,000 tons compared with the estimate made in November 1916, after allowing for 2,070,000 tons milled.

Production: the mill (using flotation) dressed 1,799,694 tons of ore averaging 2.319% copper, of which 81.61% was saved in concentrate. The smelter reduced 158,275 tons of concentrate, of which 112,549 tons was nodulized before smelting. Total charge reduced was 193,290 tons, coke used being 11.67%. Converters made 87.6 tons of blister per day, against 57.8 tons in 1916. The copper output was 31,887 tons.

General: the railroad carried 115,000 metric tons of material and 60,000 passengers. The 8000-kw. Coya power-plant worked at 35% overload in January 1917, which was maintained until August, when a 4000-kw. unit was added. A big underground station is being cut out in the Teniente mine for 4 direct-connected reciprocating air-compressors of 5000-cu. ft. capacity each. An electric railroad tunnel is the next big work on hand. A 12,000-kw. power-plant is being constructed at Pangal. Large additions were made in housing and welfare facilities. Wages were slightly higher —4.7 to 7%—but on account of exchange, wages in Chile were 35% higher than in 1916 and 53% than in 1915.

Mining Decisions

Grant of Oil and Gas—Includes Right of Entry

The owner of a right to prospect for and extract oil and gas together with the right to use so much of the surface as may be reasonably necessary for operations, deeded nine-tenths of the oil and gas to another. Held, that the deed by implication included the right to enter upon the land, prospect, drill, and extract the oil and gas so granted.

Ramey v. Stephney (Oklahoma), 173 Pacific 72. May 21, 1918.

Mining Location—Abandonment

Re-location by another locator of ground already covered by a valid mining claim, but with the consent of the first locator, is permissible at law, and the court will consider the first locator's consent as tantamount to an abandonment of his claim. If, however, the consideration for his consent was the promise of an interest in the second location, the court in quieting the title of the second locator as against the first location, will also establish by its decree the interest of the first locator in the new location.

Walsh v. Kleinschmidt (Montana), 173 Pacific, 548. June 6, 1918.

Execution Sale—Pipe-Lines Held Personal Property

Pipe-lines for placer mining attached to a water bulkhead and laid over the surface of the ground, and giants attached to the end of the pipe-line, which were taken apart and moved each year and were connected by slip-joints, may be said to be "annexed to the realty" under the rule distinguishing real and personal property; but as it was apparent from the character of their use that the owner did not intend to make them permanent accessions to his mining claim, they should be treated as personal property and not as realty under an execution sale.

Roseburg National Bank v. Camp (Oregon), 173 Pacific, 313. June 4, 1918.

Lode and Placer Locations—Requirements of Law

It is unnecessary for a locator to prove that his claim is a valuable placer mine in order to establish the validity of his placer location. It is enough that he discovers minerals and such indications of value as would justify a person of ordinary prudence in the expenditure of labor and means with a reasonable prospect of success in developing a valuable mine. Where the plaintiff located his claim, made a discovery of gold therein, panned and mined the claim enough every year to perform his annual assessment work, using pans, sluice-boxes, and ground-sluices, he sufficiently established the land as valuable for placer mining. A stone mound capable of ready identification is a "permanent monument" within the meaning of the Act, requiring the boundaries of lode claims to be marked. The notice of location must be posted at the point of discovery.

Batt v. Stedman (California), 173 Pacific, 99.

Forfeiture by Delinquent Co-owner—Proof Required

Where one of two co-owners of a mining claim neglects or refuses to perform or contribute to the performance of his share of the annual assessment work, the other co-owner may, after performing the work, serve a notice upon the delinquent co-owner to contribute his share and if he fails to do so within 90 days from date of service, title to the claim shall vest in the working co-owner, under the provisions of U. S. Revised Statutes, Section 2324. Under Section 14,260, Civil Code of California, the working owner is required to file for record as evidence of his title within the 90-day period of notice, the original notice with proof of service thereon. Failure to record this notice within such 90-day period deprives it of its force as prima-facie evidence of title, and in a cross-action to quiet title to the claim against the delinquent co-owner where it was shown that the notice was not recorded within 90 days, all of the facts upon the basis of which the alleged forfeiture was claimed must be proven by the cross-complaint before the forfeiture can be judicially declared.

Robinson v. Briest (California), 173 Pacific, 88. June 6, 1918.

Lode Location—Black Rock-Elm Orlu Case

Failure to comply with the requirement of an old Montana statute which fixed a twenty-day limit within which location notices should be recorded is cured by subsequent issuance of patent to the claims, and said patent is conclusive evidence that all requirements of law, both State and Federal, relating to location and record have been sufficiently complied with. The Federal Courts are not bound by decisions of the Montana Supreme Court to the contrary, where such decisions were announced subsequent to the location of all the claims in controversy, especially as the State statute did not provide for forfeiture for non-compliance with the recordation requirements.

Failure to adverse a patent application, the plat for which showed no conflict of surface-lines with other claims, does not estop the plaintiff from litigating in court the priority of underground rights.

When the owner of two adjoining mining claims sells and conveys one of them he conveys only that which is granted by the Government when it issues the patent to that claim, and is not estopped by such conveyance to assert extra-lateral rights on the vein of the claim which he retains.

In the absence of proof that two veins converging on the dip, unite, the presumption is that they intersect. The Court was justified in limiting the scope of its decree to proven facts, and in leaving to future development and proof other rights not yet made certain.

Decree of the District Court adjudicating the extent of each ownership on the Rainbow, Jersey Blue, Creden, and Pyle veins affirmed.

Butte & Superior Copper Co. v. Clark-Montana Realty Co. (Montana), 248 Federal, 609.

INFORMATION FURNISHED BY MANUFACTURERS

SMOKE PREVENTION IN BURNING COAL

At this time when the conservation of coal is so absolutely necessary everyone realizes that smoke issuing from boiler stacks represents unused heat-units, but everyone does not realize that certain simple rules, if observed in the fire-room, will materially decrease this loss. The suggestions given below are based on many years' experience by the Westinghouse Electric & Manufacturing Co.'s combustion engineers:

1. Give your fireman an opportunity to learn the fundamental principles of burning fuel.

2. If you have a difficult fuel-problem, consult a combustion engineer.

3. Prevent smoke by proper methods of firing.

4. Use gauges to indicate exactly the condition of the fire-bed at all times. As a minimum these gauges should consist of a draft-gauge indicating the draft in the furnace above the fuel-bed, a draft-gauge indicating the draft at the boiler side of the flue-damper, and a steam-flow metre for individual boilers.

5. Carbon di-oxide is the principal product of the complete combustion of coal; 10 to 12% of CO_2 should be obtained in the flue-gases to ensure a minimum loss of fuel.

6. Avoid losses due to unburned coal in the ash.

7. If you are wasting exhaust steam you are wasting coal.

8. Do not permit the grates to become clogged. A systematic method of keeping the air-spaces clean must be followed.

9. Inspect the baffles in the boilers, because broken or leaky baffles raise the flue-gas temperature and waste the coal.

10. Avoid cold air leaking in around the boiler-setting.

11. Install stokers; hand-firing is rapidly being recognized as an obsolete and wasteful method.

12. Clean the scale from the tubes, as every particle of scale represents wasted coal.

13. Avoid formation of soot; all boiler-tubes should be blown externally once every eight hours when in continuous service.

14. All smoke-flues should be as short and as straight as possible. Flues should also be made air-tight, and all joints and connections should be well fitted, caulked, and riveted. Use asbestos gaskets on clean-out doors.

15. Place flue-dampers in front of the boiler so that the fireman will adjust them as required. Dampers placed in the rear of the boilers are seldom disturbed, regardless of the conditions.

16. The size of the coal has much to do with the capacity and efficiency of boilers. In general, the air-pressure penetrates the fuel-bed formed by coarse coal easier than that formed by finer coal, resulting in the disturbance of the best furnace conditions.

In addition to the above suggestions, the following 'don't' list should be observed:

Don't fail to keep the heating surfaces of the boilers free from soot, scale, or oil; don't fail to keep the fires level and free from holes; don't carry the fires so thin as to draw a lot of excess air through them; don't carry the fires so thick as to have incomplete combustion of the coal; don't soak the coal with water before firing; don't fail to make sure that the blow-off valves do not leak; don't have the safety-valve popping continually; don't forget to cover the steam-pipes; don't waste steam through leaky valves or traps; don't use live-steam if exhaust-steam is available and can be used as well.

The observance of the foregoing simple rules and suggestions should materially reduce the consumption of coal of the average plant. The Westinghouse system of automatic stoker, with damper control of air to wind-boxes and to lower fuel-bed, to over-feed section, and with an auxiliary air-duct for the rear dumping-grate gives perfect combustion and insures maximum heating efficiency.

A BLASTERS' HANDBOOK

Explosives are yearly becoming more a necessity for a number of classes of work. They are necessary for mining all the metals, for quarrying stone, for improving means of travel, and for developing farm-lands. The alarm clock that announces getting-up time is made of metal blasted by explosives. The stove on which the breakfast was cooked is made of iron mined with explosives. The coal with which the stove was heated was also mined with explosives. The knives, forks, and spoons with which the meal was served at one time met with an explosive experience. The paving on the street or road is also the result of blasts, for the stone, concrete, or shale of which it is made was blasted from some place in the earth. Railroads are built, ship-channels opened, fields cleared and drained, and soils tilled by explosives. A pocket text-book called the 'Blasters' Handbook' has just been issued by E. I. du Pont de Nemours & Co. of Wilmington, Delaware, which tells in detail how to blow soot from big chimneys, how to break up old boilers and heavy machinery, and how to use explosives for every purpose where their employment is practicable. This book gives valuable information regarding the proper explosive to use, the quantity, and the method of loading and firing. It is profusely illustrated, and contains charts and diagrams that make it a valuable addition to any technical library. It does not go into exhaustive detail in many cases, but cites references to other books. These are: 'High Explosives', sections 1 and 2, which gives detailed information on high and low explosives; 'Blasting Supplies', which covers fully the subject of blasting supplies and their uses; 'Blasting Powder', which describes the uses of blasting-powder; 'Road Building and Maintenance', a treatise on road building; 'Shale and Clay Blasting', dealing with the mining of clays; 'Pole and Post Holes', on digging them with explosives; 'Handbook of Explosives', detailing a variety of uses, especially in drainage and land clearing.

Any of these can be had free of cost, by those interested in blasting, by addressing a card to the Du Pont Co., Wilmington, Delaware.

NOTES 337

CONVEYORS 339
Friction, method of drive, pulleys, and lubrication are the main points discussed in the course of appreciative comment of the article by Professor Lewis. M. & S. P., September 14, 1918.

THE SPOKANE GOLD CONFERENCE 339
This international meeting in the North-West, coming so soon after the one at Reno, should show the Government that gold-producers are in earnest in their demand for aid. A meeting of bankers was held at Portland, Oregon, at the same time, to discuss the status of gold. M. & S. P., September 14, 1918.

THE SECOND DRAFT 340
This mobilization of man-power in the United States makes all between 18 and 45 work or fight. M. & S. P., September 14, 1918.

INTERNATIONAL GOLD CONFERENCE AT SPOKANE
By Courtenay De Kalb 341
A resumé of proceedings at the convention held under the auspices of the Northwest Mining Association, and that held by the Oregon Bankers Association at Portland. Resolutions of both are given. M. & S. P., September 14, 1918.

DISCUSSION

WAGES AND SALARIES
By P. B. McDonald 343
The workingman's wages have risen considerably, while the office-man's salary has generally remained where it was, in spite of a 50% increase in living costs. Neither of these men should depreciate the other; they are both necessary to industry. M. & S. P., September 14, 1918.

THE GOLD OUTPUT: A SUGGESTION
By F. N. Fletcher 344
It is proposed to work large deposits of $2 ore, the Federal government furnishing supplies and the States the requisite labor from prisons. M. & S. P., September 14, 1918.

HOW TO AID GOLD MINING
By Thos. Marshall and F. C. Smith 344
The yield per ton of ore is considered a factor in any bounty paid on gold production. Legislation to refund to gold-miners the increase in their expenses during four years would solve the problem. ——The high cost of mining gold ore tends to decrease production of the metal; the metallurgical cost is not so serious. Freight on supplies and easing of smelting charges might stimulate the output. M. & S. P., September 14, 1918.

WOOD FOR MINING PURPOSES
By John T. Reid 345
Explanation of a Bill passed in 1878 and the one now before Congress, regulating the use of timber from Public Lands for mining purposes. In some districts where companies are not permitted to cut wood for fuel, they have to haul oil hundreds of miles. M. & S. P., September 14, 1918.

COPPER PHOSPHATE IN CYANIDATION
By George D. Diehl 347
This compound affects precipitation. Addition of lead acetate to leaching-vats, also a little ammonium chloride is a successful corrective. M. & S. P., September 14, 1918.

ARTICLES

THE MINING ENGINEER AS ADMINISTRATOR
By F. W. Hirst 348
The varied environments in which engineers direct operations result in high initiative and administrative ability. M. & S. P., September 14, 1918.

CONVEYORS
By Robert S. Lewis 349
Belt, pan, push, flight, or spiral conveyors are indispensible adjuncts to mining plants or reduction works. The belt-conveyor is an important method of carrying almost any product. All who use conveyors will find this a valuable article. M. & S. P., September 14, 1918.

IRON IN SANTO DOMINGO
By Robert B. Brinsmade 356
While the ore contains 67% Fe, the deposits are fragmentary. M. & S. P., September 14, 1918.

WAR MINERALS CONTROL 359
The complete Bill for the encouragement of production and control of distribution of minerals and metallurgical products. M. & S. P., September 14, 1918.

Simplified Arc Welding Equipment Now Ready to Demonstrate

Before ordering your welding equipment investigate the General Electric Company's novel welding system. Some of its points of superiority are:—

1. Constant Energy.
2. Shortest known arc.
3. High efficiency.
4. No resistance in series with arc.

By the use of this equipment good operators are producing consistently perfect welds.

We are prepared to demonstrate this equipment and make good deliveries.

43-42

GENERAL ELECTRIC COMPANY

EDITORIAL

WHILE going to press we received the following important telegram from the Director of the U. S. Bureau of Mines: "The War Department has provided the necessary machinery for the protection of essential industries, like mining, from the indiscriminate operation of the draft, and depends upon the companies and individuals to protect their industries by taking special care to see that skilled labor, which cannot be replaced, receives the proper industrial deferred classification. Mining organizations producing necessary war-minerals should consider it a patriotic duty to attend actively to this matter at once and to take up with their Local Boards the classification in the draft that their key-men should receive. The Army desires to have every man who can be replaced put into a classification where he will be ready to carry a gun as soon as called for, but does not wish to take men who would be more useful for war purposes where they are. Should those engaged in the conduct of essential war mines not carry out this duty promptly the War Department may naturally hesitate to furlough back men from the Army in cases where the companies have neglected to ask for the proper deferred classification for their man as provided for under the selective draft regulations. Machinery has also been created whereby in some instances the key-men in essential industries who have failed for any reason to receive industrial deferred classification may still be returned to their work by the Adjutant General of the Army after their arrival at camp. Under this arrangement the different departments and bureaus representing certain industries may designate a certifying officer who may recommend to the Adjutant General that the soldier in question be granted an indefinite furlough without pay and ordered to report to the industry where his services are needed for the protection of the metal-mining industry. For this purpose the Secretary of the Interior has named Van. H. Manning, Director of the Bureau of Mines, as the certifying officer for the Department of the Interior. This function has been assumed by the Fuel Administration for the coal mining and oil industry, so that the Bureau of Mines will receive only applications for the mining and metallurgical industries, excluding the steel industry." We commend this message to the earnest and patriotic consideration of mine-managers and others in authority. Act at once.

GROWING appreciation of the need for gold is indicated by the Government's order forbidding the mints to issue gold bullion without license from the War Industries Board, this being aimed against the consumption of the metal for manufacturing purposes.

ON another page we publish the text of Senator Henderson's bill, S. 4885, creating a Federal corporation for the purchase of the secondary war-minerals and the encouragement of these essential products. This legislation is a substitute for the War Minerals Bill.

END of the War is a phrase used loosely. Legally it means the date when ratifications of the treaty of peace are exchanged or deposited by the governments of the belligerents, or it may mean the date on which the President issues a message stating that warfare is ended.

AN immense debt of gratitude is owing to our soldiers in France. They have shed new lustre on the name of America, they have given new hope to our gallant Allies, they have made good. It remains for us at home to give expression to our gratitude by backing up their efforts, and that we can do by subscribing all that we can to the forthcoming Liberty Loan.

THE Kaiser and his precious son are commencing to sing in a minor key. One talks about "the sacred soil of the fatherland," as if the soil of Belgium, Servia, Montenegro, or France was not as sacred to the peoples whose territory he invaded as Deutschland is to him and his cohorts. The impudent Crown Prince says that the Germans want "only to hold their own" and they "are fighting for their existence" against the unscrupulous English and their allies, notably the Americans whose knowledge of European geography is so deficient that they do not know where Alsace is. It needs not the seventh son of a seventh son to predict that our boys will know all about the geography of Alsace before the Crown Prince and his army get home.

STATISTICS will prove anything. Thus, a comparison between the world's annual production of gold and the index number of commodity prices shows that in 1897 the production of gold was $237,388,998 (note the

meticulous precision in an estimate that cannot be correct within a million), while the index number was 54, as compared with 100 in 1916, when $458,808,761 of gold was produced. Therefore the increase in gold production was exactly in inverse ratio to its purchasing power. This is an excellent example of 'the long arm of coincidence,' for it would be just as reasonable to argue that the statistics demonstrate how gold production is stimulated by the increasing cost of everything used in producing gold.

STATEMENTS are beginning to appear suggesting that the Germans are undergoing a change of spirit and are becoming reasonable. The evidence available indicates that it is hunger, not moral sense, that has caused the change; it is to their stomachs, not their heads, that they owe an awakening of conscience. The people—not the leaders only—that used a free country as a road to the invasion of another country, the people that approved the deportation and enslavement of civilians, the people that applauded assassination on the high seas and wore medals to celebrate the drowning of the passengers on a non-combatant vessel, the people that backed their governors in piracy on land and sea, such a people is not going to develop a sense of ethics over-night.

IN ten days we have had three holidays, two of which were National and the third a State celebration. There seems little justification for local or State holidays in times like these, and even National fiestas might properly be diminished in number. The boys in the trenches are observing none of these holidays, and the new draft law, meaning 'Work or Fight,' suggests that those unable to fight ought to work as much as they can. The cessation of the work essential to the furtherance of the War in order that a number of persons may indulge in a pseudo-military procession is worse than ludicrous in the face of the grim realities of the moment, when the extra editions of the papers are shouting news of the deadly struggle across the Atlantic. The spectacle of organized idleness and public festivity at such a time makes Nero seem not wholly eccentric.

WE note with pleasure that Secretary Lane has written a letter to the chairman of the Ways and Means Committee of the House of Representatives deprecating "the effect of the excess-profits taxes on the production of certain minerals essential for carrying on the War" and suggesting care in assessing taxes so as not to kill these industries. He mentions "the fact that new mining enterprises of uncertain life are not allowed to amortize the actual investment before becoming subject to the excess-profit tax." This is due to the custom of regarding dividends from mines as income, whereas, as a matter of fact, most of them represent the return of capital. It is only when the mine has redeemed its capital that its dividends are real profit on the 'investment,' or speculation, as we prefer to call it. A mine is a wasting asset and until the yield from it has more than amortized the money sunk in the enterprise it is not a profitable venture, except for those that meanwhile use the stock as a counter for a gamble, selling it for more than they paid for it and for more usually than it is worth.

ELECTRIC POWER is lacking for gold mining, both on the dredges and at the lode mines, the Director of Power for the State of California having combined persuasion and command in an effort to overcome the difficulties created by a shortage of power, yet the full illumination of Market Street is to be resumed on October 1, in order to aid the business of providing pleasure for the gay and irresponsible in this City. It seems to us all wrong to foster the night life, the careless eating and drinking, the promiscuous dancing, and other means for forgetting the serious task the Nation has in hand, while, at the same time, withdrawing the electric energy needed for the production of a metal essential to the furtherance of the national purpose.

UPON pages 29a and 29b we publish a two-page advertisement for the Liberty Loan campaign announcing an organized plan for securing the co-operation of employers in obtaining the necessary subscriptions. The aim is to make every 'boss' an active participant in the Fourth Liberty Bond campaign, by inducing him to create a spirit of personal responsibility among the workers, it being taken for granted that the employers themselves will set a good example. We ask every reader to look at this announcement carefully, whether he be the manager for a mining company, the head of a manufacturing firm, or otherwise engaged in a business placing him at the head of an organization. We are in a position to supply the booklets to which reference is made in the advertisement.

OPTIMISM is becoming rampant, but the victory is not yet won. Much remains to be done and many long battles are yet to be fought, by American armies, among others. As the 'New Republic' says: "Victory will be ours when, and not until, the Prussian way of thinking shall have been eliminated; when it shall have seen itself as futile and unprofitable as we have seen it base. Victory will be ours when the doctrine of the divine right of might shall have been laid at rest wherever it exists the world over. Victory will be ours when the autocratic psychology of force shall have been supplanted by the democratic psychology of consent; when the politics of force shall have given way to the politics of consent." We commend this utterance to the thoughtful consideration of our readers.

IN this issue we reproduce an appreciation of the mining engineer, as typified by Mr. Hoover, taken from 'Common Sense' and written by Mr. F. W. Hirst, who used to be editor of 'The Economist,' in many respects the cleanest and best financial periodical in the English language, and therefore in the world. Mr. Hirst appears to have been *bouleversé* by the War, for today he

is a follower of Lord Lansdowne and a preacher of something closely akin to pacifism, but one cannot doubt his sincerity or the high character of his work as a journalist. In the article that we quote he pays a sympathetic tribute to Mr. Hoover and to the ability of the profession of which our Food Controller is a member. The late Lord Rhondda, the British Food Controller, likewise was an operator and engineer of coal mines, and Sir Charles Fielding, chairman of the Rio Tinto copper company, is now Director-General of Food Production in England.

Conveyors

Mechanical conveying apparatus is a necessary adjunct to milling operations. The design and manufacture of it has developed from an insignificant beginning to a highly specialized industry, and in common with other specialties, is none too well understood by the general practitioner. Mr. Robert S. Lewis, Professor of Mining in the University of Utah, contributes an interesting and instructive article in this issue dealing with the design and application of the conventional types of conveyor. We confess that we never did know the significance of the term 'friction' as applied by the belt-maker to the function of the rubber as a means of holding the canvas layers, or plies, together. It seems to be a colloquialism applied by the belt-maker to his own particular trade. At any rate, it is a term that is used glibly by the salesman with a knowing air that evokes a pardonable curiosity upon the part of the mine superintendent. Mr. Lewis, however, offers a means of determining the efficiency of the so-called 'friction' by a simple test, which is rational, effective, and should enable the prospective purchaser easily to appraise the serviceability of the belt that he is going to buy. The question of the proper position for the drive end of the conveyor is determined by whether the conveyor is horizontal or is expected to elevate and also to convey. If the conveyor is horizontal, it is of no special consequence whether the drive be at the head or the tail end. If the conveyor is set at an angle and is expected to perform the function of an elevator as well, the drive should invariably be at the discharge end. A belt must be pulled up; it cannot effectually be pushed up. It is interesting to note, in Mr. Lewis' article, the copious reference made to the formulas developed by manufacturers; this is only another instance where commercialism inspires scientific research in order to render possible better service for the user. All the engineers in the world are not in consulting practice, and much of the best work that has been done in engineering research has been accomplished in the experimental laboratories and testing-plants of the manufacturer. Too little attention is given by designers to the determination of proper diameter of pulleys. As Mr. Lewis points out, the thickness, or number of plies of the belt, is the governing factor; too small a pulley in proportion to the thickness of the belt lessens the life of the belt greatly. There is another factor influencing the length of service obtained from the belt, and that is age. After a time, the rubber loses its elasticity, it hardens and cracks. This occurs whether the belt be in use or not; in fact, idle belts seem to succumb to the ravages of time more rapidly than those in constant use, in which respect they are similar to the human machine. Why is it that lagged driving-pulleys are not used more frequently? Wood or rubber-strip lagging may be employed to good purpose; it greatly diminishes the loss of power due to slippage. This is especially true wherever the troughing-belt is used to elevate as well as to convey, and the degree of elevation approaches closely to the critical angle beyond which the material will not cling to the surface of the belt. Chutes feeding belt-conveyors should be set at such an angle as to minimize the abrasive effect of the material upon the belt, and, if the material fed is ore in comparatively large particles, some sort of hinged baffle should be placed in the chute to break the force of impact on the belt. Belts are costly, especially at the present time, and every possible care should be exercised to obtain the utmost service from them. 'Dusting,' where fine dry material is conveyed, is another cause of destruction, especially to bearings. The compression grease-cups should be inspected daily and kept filled. Keep the dust and dirt outside; there is no objection to the spectacle of grease exuding from the space between the pulley-hubs and the bearings, in fact, it is an excellent surface indication of good lubrication inside.

The Spokane Gold Conference

If a point of distinction were to be drawn between the fruits of the two recent conferences in aid of gold production, it would be that the predominant importance of the gold output to the financier was more forcibly accentuated at the meeting in Spokane. This is not to imply that the American Gold Conference was not keenly conscious of the value of gold as a basis for currency and credit-expansion; the entire argument of that body for relief to the gold miner was based on the need of new gold as an addition to the reserve in the Treasury. For this they had the unqualified dictum of Secretary McAdoo; but the banking interests had not joined in the plea for assistance to save the languishing gold industry. The representatives of actual production, in fact, had not before assembled; their difficulties had not been made known in an authoritative manner; only in a vague way was it realized that something was wrong at the source of our financial stream. The conference at Reno therefore stated the case of the gold miner for the first time in a large and impressive form, and the gravity of the peril was enforced upon the attention of our people. The International Gold Conference, called by the Northwest Mining Association at Spokane, on the other hand, was supported in a notable manner by the first clear voice on behalf of the gold producer that has come from the commercial bankers of the country. A meeting of the promi-

nent bankers of the North-West and of California met at Portland on September 5 for the express purpose of recommending that action be taken by the Government to sustain the production of gold at a volume undiminished from that which had existed before the War. Emphatic resolutions to that effect were passed. It is pleasing to record, moreover, that there was no collusion between the bankers and the gold miners in this matter. So independent were the two movements for a discussion of this question that arrangements for the respective conferences had been made before either group became aware of the other's intentions and the dates for the meeting were found to coincide. The action of the Pacific Coast Bankers Gold Conference has fairly launched the propaganda for Federal assistance to gold mining in the financial world, and we understand that further steps were taken to ensure ample consideration of this serious problem by the American Bankers Association at Chicago later in the month. The American Gold Conference also will be represented at that meeting.

At Spokane the influence of the Portland meeting was clearly seen. The deliberations concerned the financial aspects of gold production and its importance in expanding credits. It was pointed out that the commercial credits extended by our banks at the present time amounted in many cases to twenty times the volume of gold on which they were founded, and that in times such as these it was not remarkable that such should be the fact. If that ratio prevail widely, as it is believed to do, the value of the normal annual output of domestic gold in our commercial relations would exceed two billions of dollars. Thus its importance rises to the highest class among the commodities of all sorts produced in the United States. On the other side of the question, the Spokane conference dwelt more elaborately on the details of the ways and means that might contribute to the salvation of the gold industry, and it quite firmly put itself on record in favor of the payment of a bounty as the most feasible and practicable method. The distinction also between the payment of the official price of $20.67 per ounce for the new gold actually sold to the Mint and of a bounty on presentation of proofs of production and delivery, as a reward for services rendered in sustaining the gold reserve, was clearly made. The work of the International Gold Conference was highly constructive and was conducted along broad lines, which will give weight to the opinions expressed. They fully represented the larger mining interests in the North-West, and Canadian delegates added to the strength of the meeting, giving it a valid reason for calling itself 'international.' One gratifying outcome of the proceedings was the frank and complete endorsement of the platform of the American Gold Conference and the decision to co-operate with it in all efforts that may be made to secure favorable action by the authorities at Washington. By thus recognizing the necessity for union among the gold miners, and by making common cause, the facts concerning the needs of the gold industry and a proper measure of the remedy to be applied, can be more quickly and definitely ascertained by the officials of the Treasury Department and others who will have to deal with the legislative problems involved. The Northwest Mining Association has rendered a distinct aid to the gold producers and to the country by its convention.

The Second Draft

Last Thursday the new draft went into effect and every man between the ages of 18 and 45 had to register. Congress has seen fit to mobilize the manhood of the country, so that all the human power required for the national purpose may be available for use in the ratio of one man at the front to four men at home working. This last word is emphatic, for the new draft law is equivalent to a mandate of 'work or fight'; it is a conscription of labor, no less than a military muster, the intent of it being to compel the slacker to do his share either in the trenches or in the factory. This law, supplemented by the organization of the Employment Service Bureau, will have the effect of rendering idleness difficult, if not impossible, although it must be admitted that as one man can lead a horse to water and twenty cannot make him drink, so Congress may compel a man to go to work, without succeeding in making him work. One of the scandals of the day is the manner in which abnormal wages are being paid to men that are able to so terrorize their foremen and overseers as to give only a fraction of the labor for which they are paid. The efficiency of labor, notably in the shipyards and munition plants, is said to be painfully low. That, however, is another story. The new draft law will not cure this evil so long as the labor leaders wink at it, but the broad result is to place American manhood on the economic firing-line. Those whom the French call *embusqués*, that is, occupying posts of safety in the rear, as, for example, in offices at Washington, will be smoked out into vital effort, their places being taken by older men, unfit for a higher service, for, talk as you may, there remains no service so great, no sacrifice so real, as that of the man who risks his life in battle, on land or sea. Popular sentiment is wrong in rating the man in the shipyards and factories, in the mines and in the fields, as the peer of the soldier; the holiday-makers that paraded our streets on Labor Day are not the equals of those in Pershing's army, and no amount of verbal camouflage can obscure the fact. Will the children of today think as much of the man that earned $10 per day in a shipyard as of the man that for the nominal pay of $1 per day crossed the sea to fight the Germans? No; and that is why we say that the future of the United States, as of the other Allied countries, is not destined to pass into the hands of Labor, however big you make the L, but it will be in the hands of the clear-sighted courageous young men that will come back from the War, ennobled and intensively educated by the most inspiring experience that falls to the lot of an intelligent citizen—to fight successfully for a great cause.

International Gold Conference at Spokane

By COURTENAY DE KALB

Two simultaneous meetings have been held in the North-West that have once more brought into prominence the urgency of the necessity for early Federal action to save the gold industry from dwindling to insignificant proportions. These were the convention of the bankers of Oregon, Washington, and California, under the auspices of the Oregon Bankers' Association, at Portland, on September 5, and that of the International Gold Conference, called by the Northwest Mining Association, in session at Spokane, Washington, on September 5 and 6. This is the first instance in this country of a convention of bankers definitely calling attention to the need of stimulating the output of the gold mines, in order to protect the Treasury's gold reserve. The meeting was representative of the larger financial interests of the three States mentioned. The chief topic of discussion was the need of more gold as a basis for credits, and a paper analyzing the present position of the finances of the country, with special reference to the gold-reserve, was presented by John Clausen, vice-president of the Crocker National Bank of San Francisco. Resolutions voicing the importance that the convention attaches to protecting and aiding the gold mines were adopted as follows:

WHEREAS, Secretary of the Treasury, William G. McAdoo, has called the attention of the country to the necessity for the largest possible output of gold, in order that the credits of the country may be stabilized, and

WHEREAS, reliable statistics show that the gold production of the world declined from $469,000,000 in 1915 to $430,000,000 in 1917, and that of United States from $101,000,000 in 1915 to $84,000,000 in 1917, with a still further decline for 1918, estimated by reliable authorities to be $11,000,000 based upon the production for the six months ending June 30, 1918, and

WHEREAS, this decline in production is due largely to the fact that the cost of producing gold as a commodity has exceeded the fixed monetary price of $20.6718 per ounce for the major portion of the domestic gold produced; now, therefore, be it

Resolved by the bankers here assembled that they heartily approve of the appointment by the Secretary of the Interior of a committee to study the increased cost and the decreased output of gold in order that the gold production of the United States may be maintained at its pre-war volume.

It may be noted that the active interest of E. G. Crawford, vice-president of the United States National Bank of Portland; A. L. Mills, president of the First National Bank; and Edward Cookingham, vice-president of the Ladd & Tilton Bank, both of the same city, was responsible for this notable gathering, which has taken the lead among the banking organizations of the country in taking up the fight of the gold miner for existence.

The International Gold Conference was a spontaneous effort of the North-West to register its opinion regarding the need of sustaining the gold industry. It followed logically upon the definite position previously taken by the Northwest Mining Association, which has been widely cited by mining men, and approved by the Minister of Mines of British Columbia, the Hon. William Sloan, in his recent report on the conditions of gold production in that Province. It may be noted that the 'internationalism' claimed for the Spokane conference is based primarily upon the fact that the Northwest Mining Association includes British Columbia, and a large delegation of prominent gold producers from that Province was in attendance, including William Fleet Robertson, Provincial Mineralogist; R. F. Green, of the Dominion Parliament; and Ernest Levy, of Rossland. The discussions at the Conference, however, did not trench upon international financial relations. The Canadian delegation appeared to believe that if measures for relief of gold mining were taken by the United States government, the Dominion would follow suit. The significant acts of the International Gold Congress consisted in the adoption of resolutions endorsing the position of the American Gold Conference recently held under the auspices of Emmet D. Boyle, the Governor of Nevada, the Reno resolutions being re-adopted in their entirety, with a further pledge that "the International Gold Conference of the Northwest Mining Association shall work in harmony with the American Gold Conference so that the producers of gold may stand solidly together in seeking the relief necessary to preserve the industry." The American Gold Conference was represented at Spokane by Eugene Davis, Courtenay De Kalb, and H. N. Lawrie, and close working arrangements between the two conferences were definitely arranged.

As an individual expression of the aims and views of the International Gold Conference, additional resolutions, based largely upon a draft prepared by F. A. Ross of Spokane, were adopted as follows:

WHEREAS it is now clearly understood and agreed by the Allied nations that national gold reserves must be augmented without delay if rapidly expanding credits are to be secured; and

WHEREAS, at this time, the production of gold is daily decreasing to an alarming extent because of well-known conditions that render the mining of gold-bearing ores unprofitable; and

WHEREAS there is no way which the mining of gold-bearing ores may be made profitable except by the direct aid and influence of the Government; and

WHEREAS the Government has appealed to the mining industry for practical information and practicable suggestions upon this subject; now, therefore, be it

Resolved, by the International Gold Conference of the

Northwest Mining Association, assembled at Spokane, Washington, September 5 and 6, 1918, and representing Alaska, British Columbia, Washington, Idaho, Montana, and Oregon, that the following topical suggestions for an improvement of the gold situation be offered to the authorities, in the hope and belief that they will prove effective, if properly elaborated and applied, either singly or in combination, as the case may require:

First: That the grant of priority-rights in the purchase and transportation of materials, machinery, and general mining supplies be enforced, and that, as far as possible, such items of expense as taxes and freight-rates be restored to pre-war levels.

Second: That the labor necessary to the operation of mines producing gold-bearing ores be assigned to them.

Third: That main lines of motor-truck roads be built from railroad points into the distributing centres of promising but commercially inaccessible goldfields, for instance, such as those of central Idaho. Also that trails or wagon-roads, connecting with these main roads, be opened to promising camps in cases where the routes thereto lie through Government reserves.

Fourth: That financial aid, or credit, be extended to such individual properties as may be judged by Government specialists to be capable of producing appreciable quantities of gold or other metals essential to the conduct of the War.

Fifth: That a bounty be paid upon every ounce of *new* gold produced by the mines of the nation, the amount of which bounty shall, from time to time, be determined by the proper authorities to be sufficient to encourage the mining of gold-bearing ores by ensuring a reasonable profit therein; the said bounty to be considered a permissible war expedient and expense that in no way affects the international, or standard, value of gold.

Resolved, That this International Conference approves the arguments and general plan outlined in the monograph entitled, 'The Proposed Bounty on Gold,' which is attached hereto and made a part hereof; and that the same is respectfully recommended to the authorities for consideration.

Resolved, That copies of these resolutions be forwarded to the proper authorities at Washington, D. C., and Victoria, B. C.

It will be seen that the scope of these suggestions for relief to the gold-mining industry includes many forms of aid, which are proper in the furtherance of such enterprise, and are in accord with proposals that have been offered in connection with pending legislation, and many plans actually being carried out in regard to the stimulation of the output of manganese, chrome, and other minerals. Such relief, however, would be of small benefit to many of the older productive gold mines, although in some cases it might stimulate important production from districts now dormant. The chief recommendation is that of the payment by the Government of a bounty, adequate to enable the gold mines to operate on a reasonable margin of profit. The Conference also endorsed the pending joint resolution in Congress for continuance of the present exemption from assessment work on mining claims beyond this year, for the period of the War, and added the recommendation that such exemption apply for one year after the year in which the War may terminate. It was further recommended that the Government appoint a practical, successful, gold-mine operator on the industrial commission that is to be sent to Russia, with special reference to the development of the gold resources of Eastern Siberia.

Many notable addresses were delivered, covering every phase of the gold industry and its relations to the national welfare. The bankers' viewpoint was presented by George H. Greenwood of Spokane, carrying with it a recognition of the feasibility of a bounty or royalty. Similar opinions were advanced by Judge George Turner, who presided as chairman of the conference. He insisted that an adequate volume of metallic money was essential to avert a calamity resulting from an era of excessive credit-expansion. His earnest declaration for sound money became the dominant note of the convention, and prevailed in all the resolutions that were adopted. He also showed that a bounty was both feasible and practicable, without disturbing the foundations of finance. W. Dick, president of the Spokane Clearing House Association, also advocated a bounty, and urged governmental action. Maurice D. Leehey and others with Alaskan experience showed that, with small additional outlay in labor and supplies, the Alaskan output of gold might be nearly doubled at once if a bounty were paid sufficient to admit of treating the extensions of deposits on each side of the channels where now only the richer central gravel could be worked at a profit. Valuable statistics covering the output of gold, costs, and the relations of gold to other industries, were given by H. N. Lawrie, chairman of the Oregon Bureau of Mines. He also presented a telegram from the Director of the U. S. Geological Survey, as follows: "No final gold figures for all States available for 1917, and only estimates for 1918 based on mid-year statements. Total decrease this year, ten or eleven million dollars from $84,500,000 in 1917. Increases in Arizona and Montana offset losses in Utah, Idaho, and New Mexico. Decreases, probably four million in Alaska, two and a half to three million in California, two and a half million in Colorado, one million in Nevada, two or three hundred thousand each in South Dakota and Oregon."

A luminous exposition of the national importance of an immediately increased output of gold in providing a protection to our Governmental obligations as the demands of war became more onerous, and as insurance against depreciated currency, was given in an address by Eugene Davis, one of the delegates from the American Gold Conference to the meeting at Spokane.

Coal deposits in the district of Llapo, comprising part of the province of Pallasca in Peru, are described in a report by A. P. Figuerola, and issued by the Peruvian Ministry of Fomento as Bulletin 89 of the Cuerpo de Ingenieras de Minas. They extend over an area of several hundred square miles, at an altitude ranging from 3000 to 7000 ft. above the sea, and are about 30 to 40 miles from the Chimbote-Recuay railroad. It is a dry coal of somewhat unusual character, containing on an average about 20% volatile matter, and 72% fixed carbon, with an ash content of 4 to 9%.

Wages and Salaries

The Editor:

Sir—Mr. Charles M. Schwab has been saying a good deal about the point of view of the workingman. He predicts that economic changes are evolving so rapidly that the proletariat of a few years hence will have unquestioned control of things. By 'proletariat' is meant men who have only their labor to sell, as distinguished from bourgeoisie (detested by the Bolsheviki) who possess a home, or money in the bank, or investments. Schwab's prophecy of the magnitude of the impending change recalls Macaulay's summing up of history as a succession of changes by which a class or group hitherto weak becomes strong and demands rewards equal to its new strength, being resisted by those already entrenched in the enjoyment of privilege and power. The bourgeoisie may prolong their position by adding to their class influential members or cliques of the proletariat. A proletarian who has his wages so raised that he saves money for investing in real estate, Steel stock, or Liberty bonds becomes *ipso facto* a bourgeois. Schwab once drove spikes at a dollar a day for the Edgar Thomson steel works. Today he works equally hard at various big affairs. It is interesting to recall that when Schwab was president of the United States Steel Corporation, he displeased the Wall Street controllers of that company by having "too much imagination" and being "too independent," so that he was finally removed from the position. His Ship Trust was a failure. But big men learn from failures, and he is now directing a successful campaign of building ships to defeat a Hog Trust in Europe.

Karl Marx, the German father of Socialism, deduced from his painstaking study of economics that modern capitalism exploits the laborer by getting possession of the "surplus value" of his services, that is, the amount produced by him over and above the amount of his wages, which are regulated by the "iron law" of competition and tend therefore to a minimum. Many modern agitators reason on this principle. Professor Scott Nearing, now out on bail, complains that "workingmen are only paid $800 or $900 per year, whereas they deserve $1500." No one, he says, has ever figured out what the workingman earns. The employer is not interested in that. For instance, a man who makes a wheel for an automobile or watch, on which perhaps 1% of the labor for the complete product is expended, does not receive 1% of the selling price; he receives a wage that represents the minimum for which another man could be obtained to do the same work. In the gradual adjustment of wages employers have ultimately hurt their own case by offering workmen a temporary bonus to speed up, and then, when a high speed has been proved possible, putting wages back to the old level or very nearly there. When a miner drives a tunnel at a cost of $4 per foot, where the previous cost was $6 per foot, some mining companies begrudge paying extra for the extra skill and application, or perhaps allow the miner only a very small proportion of the saving. Such niggardliness has helped to create the antagonism of labor to capital that has so handicapped employers of late years; it is in avoiding such pinch-penny ways that Schwab succeeds. Like the Irish peasants, many American workmen are today in a favored position but are sulking over old injuries. Scott Nearing can adduce data and juggle statistics to prove that 75% of American workmen are starving, but the evidence of the eye tells any observer that American workmen are a well-fed and healthy-looking class. Of course, there are individual injustices, hardships, and disproportions, but, speaking generally, the man drawing wages has less to worry over than the man on a fixed salary.

Men on a fixed salary are today in a quandary similar to that in which the gold-producers find themselves. Their income has remained stationary while expenses have increased 50%. The gold-producers have held meetings and will probably induce the Government to allow them a bonus. The fixed-salary people cannot hold meetings but have to keep on buying Liberty bonds and the high-priced necessaries of life. As 'Life' remarked recently, "not all the heroes are on the firing-line." The scholarly 'Springfield Republican' professes to see hope for the salaried worker in the drawing of so many men from business and professions into the Army, but as yet no wide-spread movement has acted to raise salaries.

The work that salaried men do is different in character from that of workers who draw wages. They do not drive rivets or make automobiles or run drills. Their work does not show such direct or such practical results. They plan, tabulate, compare; they talk, think, and read; they persuade, initiate, and produce impressions; they analyze, research, and dream. To short-sighted workmen the position of a salaried man seems like a sinecure, for he does not comprehend the strain, constancy, and vigilance under which the latter moves. Commentators like Schwab and Nearing are apt not to see the importance of the results accomplished by the

salaried man. To them the world is one big factory in which everyone should be producing tangible effects. Yet the world would suffer inconceivably if the ranks of silent, thinking, salaried men were much reduced in number or quality. Reasoners like Schwab and Nearing suffer from what Professor R. B. Perry of the department of philosophy at Harvard accused Herbert Spencer of laboring under—'pseudo-simplicity'—the failure to distinguish the simplicity that follows solution from that which precedes it. In general, people are giving too much emphasis to work that shows material results and not enough to invaluable indirection. Such a point of view is narrow and may become sinister. Pseudo-simplicity is a real evil. The man who researches in a laboratory or library is as necessary to the world as the man who drives his thousands of rivets per shift. The latter draws $8 or $10 per day; the former receives $1500 per year, or less than the pay of the riveter.

The Gold Output: A Suggestion

The Editor:

Sir—There are two standpoints from which to view the much discussed need of an increased gold supply. There is the national or public point of view, looking to the serious situation which undoubtedly confronts the Government in its efforts to hold at par its enormously increased and constantly increasing indebtedness on a comparatively diminishing stock of gold bullion. This point of view appeals to every citizen, no matter where he lives or what his occupaton. There is also the point of view of the mining industry, to which the Government looks for its gold supply, but which to a greater degree than any other industry in the country is caught between the upper and nether millstones of the economic situation growing out of war conditions; for, unlike the product of other industries, the price of gold remains fixed while the cost of production has soared. This point of view appeals to gold-producers and to gold-producing communities, as was brought out at the important conference called by Governor Boyle of Nevada and held at Reno in August. From the standpoint of the public any method that gives promise of increasing the output of gold is worthy of consideration. It was pointed out at the Reno conference that if the Government is to preserve a safe gold basis for its notes and bonds without depleting the reserves of its Allies it would be necessary to increase the annual output of American gold something like fourfold. To help this increase even in a small degree the following suggestion is offered:

It is known that there are large bodies of gold-bearing ore in many of the gold-producing States that will carry approximately one-tenth of an ounce of gold per ton of ore. Even under normal conditions ores of this class offer no commercial attraction. The gross amount of gold thus locked up runs into millions of ounces. The suggestion is that the Federal Government furnish the supplies and the States in which the ores are situated furnish the labor from its prisons, to unlock this now unused and useless supply of needed gold. Many of these orebodies belong to the Government, and others could be commandeered. The cost of the necessary supplies would be less than the premium that the Government could well afford to pay on the gold. There could be no objection to the use of prison labor on this particular work; it would in no wise compete with free labor, because the work can never be done at a living wage; it would be of advantage to all wage-workers, because, other things being equal, the greater the output of gold the greater the purchasing power of a day's wage; and it would help to win the War, as wage-workers in common with all patriotic citizens most earnestly desire. It would be a boon to the convicts, giving them a change from the frightful monotony of their lives and an opportunity to rehabilitate themselves. Their probable sentiments on the subject may be inferred from the remarkable, not to say pathetic, letter recently written by Californian convicts to Governor Stephens, asking as a privilege that they be allowed to build a proposed road to some chrome mines in order that they might help in the War. Men convicted of minor crimes are not thereby convicted of lack of patriotism; and it is a pity that thousands of them, who would gladly offer their lives in France, cannot be accepted as soldiers. The plan suggested would at least offer them an opportunity for useful service. Out of the product of their toil in the mines they should receive a small wage in money and a liberal credit in time-deductions from their sentences. Plans and methods would necessarily be modified by local conditions, and careful investigation by engineers would be required; but the scheme itself, I believe, is sound. It is probable that in the gold-producing States there are more than 5000 prisoners that could be safely employed in the work. In large orebodies an average output of two tons per day to the man could be expected, or a daily product of not less than 1000 ounces of gold; if not great, it would be worth while. In these days, when we are wisely demanding that human parasites shall either 'work or fight', it is well for society to cleanse its house of the unwilling parasites that our uncivilized prison methods have created. The suggestion offered has its ethical as well as its financial side.

How to Aid Gold Mining

The Editor:

Sir—In B. L. Thane's article, in your issue of August 3, occurs this sentence, "So far as the United States is concerned, the first and immediate necessity is legislation which will permit the continuation of the present gold-mining industry." In the discussion of the crisis, there seems to be a general hesitation to propose legislation to change the value of gold and a belief that this could only be done in concert with the governments of Britain and France. But, in all probability, it would take many

months, and perhaps years, to reach such an agreement; and as Mr. Thane writes, the problem is one of 'immediate necessity.'' A bounty on new gold would almost certainly affect the value of all gold, no matter what arbitrary price the Government put on an ounce of gold 1000 fine.

Besides, a bounty is likely in some instances to help those producers most who need it least. In other words, the yield per ton of the ore, which is not in the least affected by the War or the Kaiser, becomes a factor in the amount of the bounty. But if legislation could be enacted rebating or refunding to the gold miners the increase in their expenses during the last four years, it would go direct to the root of the trouble, put the man with the rich mine and the poor mine alike on the same footing as they were before the War, and, therefore, be a 'square deal all around.'

The editorial in the 'Engineering and Mining Journal' of August 10, entitled 'The Demand of the Gold Miners' has a glimmering of the light in this direction when it says, ''Thus the Government might enter into an agreement to pay to what are distinctly gold mines a bonus of $10 per oz. upon their production, not to exceed the average annual rate of a series of recent years.'' It can readily be seen that, in the case of some mines, it could happen that this arrangement would frustrate the intention of the Treasury department, which is to stimulate the production of gold and not retard it.

Against this plan it may be argued that there would be a great temptation on the part of the mining companies to 'pad' their costs and that it would take an army of inquisitorial inspectors to see that this was not done. But this would not be as big a task as some might think, for all the legitimate gold-mining companies keep their costs from month to month with great exactitude. On the other hand, in the case of the bounty system, there would be a great temptation on the part of those holding large stocks of old gold to sell to the Government and get the bounty.

THOS. MARSHALL.

Grass Valley, California, August 29.

The Editor:

Sir—In the proper settlement of the matter undertaken by the American Gold Conference a tabulation of conditions seems necessary.

The stimulation of gold mining axiomatically requires reduction of costs, since the very condition of gold as a standard prohibits any increase in its value by Act of Government.

The cost that tends to decrease the production of gold is that of mining, as distinct from metallurgical cost. In other words, the smelters seem to be getting along fairly well without nursing.

The more important items in the cost of mining include labor, freights, explosives, steel, machines and parts, oils for fuel and lubrication, and timber. Of these the first probably cannot be altered. A just increase in all the others is entirely due to Government action under stress of war conditions. The second item—freights—can be entirely eliminated, if deemed wise by the Government, or, at least, to such a point as to establish a proper balance with the increased cost of labor. Action along these lines (combined with the somewhat necessary paternal scrutiny of smelter-rates) would ensure the production of gold as of yore.

A difference of condition is evident between the producing mine and the prospective mine; but amelioration of general costs will serve each alike. The development of prospects always entails a 'gamble': and it is reasonable to suppose that there is less money available for any sort of speculation during time of war. It is axiomatic that, in order to develop mines, prospecting should be fostered; and it may be safe to say that, if the prospector is certain that his property will have an assured value if it develops into a real mine (as a result of the Government protection of gold mining) it is likely that he will rustle for a grubstake as energetically as ever.

Chloride, Arizona, August 27.

Wood for Mining Purposes

The Editor:

Sir—A matter of great interest to the mining industry is the supply of wood. Realizing such to be the case, Congress passed the following Bill on June 3, 1878:

''Be it enacted etc., That all citizens of the United States and other persons, bona-fide residents of the State of Colorado, or Nevada, or Idaho, or Montana, and all other Mineral Districts of the United States, shall be, and are hereby authorized and permitted to fell and remove, for building, agricultural, mining, or other domestic purposes, any timber or other trees growing or being on the public lands, said lands being mineral, and not subject to entry under existing laws of the United States, except for mineral entry, in either of said States, Territories, or Districts of which such citizens or persons may be at the time bona-fide residents, subject to such rules and regulations as the Secretary of the Interior may prescribe for the protection of the timber and the undergrowth growing upon such lands, and for other purposes. PROVIDED, that the provisions of this Act shall not extend to Railroad Corporations.

Sec. 2. That it shall be the duty of the Register and Receiver of any Local Land Office in whose district any mineral land may be situated to ascertain from time to time whether any timber is being cut or used upon any such lands, except for the purposes authorized by this Act within their respective land districts; and, if so, that they shall immediately notify the Commissioner of the General Land Office of that fact;

And all necessary expenses incurred in making such proper examination shall be paid and allowed such Register and Receiver in making out their next quarterly accounts.

Sec. 3. Any person or persons who shall violate the provisions of this Act, or any rules or regulations in pursuance thereof made by the Secretary of the Interior, shall be deemed guilty of a misdemeanor, and, upon conviction, shall be fined in any sum not exceeding Five Hundred Dollars and to which may be added imprisonment for any term not exceeding six months.''

When this Act became a law, it relieved many who had been trespassers upon the Public Domain from being

prosecuted. The Government realized the importance of fostering the mining industry and lending aid, wherever such was possible, by extending the rights of the individual to all persons, corporations, and associations engaged in mining, to the use of wood off the Public Domain, without restrictions, except as to rules of the Department of the Interior, as mentioned in the Act.

The Commissioner of the General Land Office, has been governed in his granting permits, not by the intent of the Act, but by its specific wording, whereas, he has ruled that a permit is to be denied a corporation organized under one State and operating in another, for the reason, that such a corporation is not a citizen under the wording of the Act. Citizens of any State may enter another and avail themselves of the provisions of the Act, where a corporation is denied this. It is hard to reason why such should be the case, for a corporation is an aggregation of individuals and if they obey the laws of the State in which they are conducting business, they should be considered as being entitled to enjoy all of the rights of an individual; however, the interpretation of the Commissioner is to be observed, rather than invite trouble. He realizes that the law as it now stands should be corrected and has so expressed himself, the remedy lying with Congress.

Senate Bill No. 26, through the joint efforts of some of the members of the mining States of the West, passed the Senate on February 5, last; this aims to amend the Act above mentioned, so that corporations organized anywhere in the United States may avail themselves of the privilege of the Act. This Bill, as it passed the Senate is as follows:

"*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled*: That section one of an Act entitled 'An Act authorizing the citizens of Colorado, Nevada, and the Territories to fell and remove timber on the public domain for mining and domestic purposes', approved June third, eighteen hundred and seventy-eight, chapter one hundred and fifty, page eight, volume twenty, United States Statutes at Large, and section eight of an Act entitled 'An Act to repeal timber culture laws, and for other purposes', approved March third, eighten hundred and ninety-one, as amended by an Act, approved March third, eighteen hundred and ninety-one, chapter five hundred and fifty-nine, page one thousand and ninety-three, volume twenty-six, United States Statutes at Large, and the several Acts amendatory thereof, be, and the same are hereby, extended so that it shall be lawful for the Secretary of the Interior to grant permits to corporations incorporated under a Federal Law of the United States or incorporated under the laws of a State or Territory of the United States, other than the State in which the privilege is requested, said permits to confer the same rights and benefits upon such corporations as are conferred by the aforesaid Acts upon corporations incorporated in the State in which the privilege is to be exercised; PROVIDED, that all such corporations shall first have complied with the laws of that State so as to entitle them to do business therein; but nothing herein shall operate to enlarge the rights of any railway company to cut timber on the public domain."

There are at this time, many corporations, without any knowledge that they are trespassers upon the Public Domain, who are using the wood from off such domain for mining purposes that may be prosecuted therefor. They are ignorant of the fact that they are violating the law, and may only discover this when an action has been begun against them. This condition is a manifest injustice and it should be remedied at once.. The purpose of this communication to you is to arouse interest and bring this serious state of affairs to the attention of those who may be affected. The officers of the Government are interested in having nothing interfere with the going mining concerns of the country, or to cause any contraction in the supply of metals. This matter has come before, not only the General Land Commissioner, but many of the heads of the Government, and they are all a unit in declaring that the defect in the law as it passed originally should be remedied. The Bill, after its passage through the Senate, was referred by the House to the Committee on Public Lands. It is now in that Committee. It would appear that the time that has since elapsed should have been sufficient for the Committee to have acted upon it; however, I am advised today that such has not been the case, evidently, it must be that other matters have been given preference of action.

There are many corporations operating in the West that, in order to continue operations, may find it necessary to ship into their districts, at much added expense and inconvenience, either coal or oil, for fuel. In either case, they immediately add to the burden imposed upon the coal mines and oil-wells to meet the demands from other sources, involving war needs, thus bringing about complications and troubles that should not exist, and would not, if the Bill now in the House becomes law at an early date. Undoubtedly there are some corporations now calling for supplies of coal and oil, for fuel, that would be able to use near-by wood were the Bill passed.

It may be well to mention that in the remote mining regions of the West much depends upon what conditions are imposed upon the securing of local fuel, and, where it is incumbent upon corporations to secure fuel from long distances, the consideration that might otherwise be given to the development of a mining prospect will be abandoned, thus retarding the development of our mineral resources, for usually companies that have organized outside the State are those most capable of large-scale operations. I might also refer to the operation in the areas that are well supplied with timber, not alone in the Western States, but, more particularly in Alaska. What a spectacle is presented of wasted energy where corporations formed outside the State are obliged to haul oil several hundred miles by rail, thence by wagon, for 40 or 50 miles, perhaps again to be carried to the mountain-tops by tram to the mines, to be consumed, in a locality where timber abounds. Is it not a rediculous acrobatic feat that they are called upon to perform by virtue of defective laws? How is it possible, under such conditions, to practice the economy necessary to make our mines remunerative?

The operators of mines wish to have this condition corrected, the citizens of the various mining States are vitally interested that such should be done, to increase

interest in their mineral deposits by inviting outside corporations to join in the development of their mines: the wonder is that a matter of such vital concern should remain so long without having been corrected, and without the attention from Congress that it deserves. The Government itself is concerned, and well it should be, for such circumstances as force corporations to abandon, against their will, any development work that has for its purpose the production of metals is against the national interest. We need to have this Bill become a law just as soon as possible. Our Congressmen should be petitioned to get this measure on the statute-book quickly. The purpose of this letter is to make the mining fraternity aware of the anomaly, so that they may ask their Representative to give this Bill his special attention. The several departments of the Government interested in the production of minerals should also interest themselves in promoting the early passage of the Bill.

JOHN T. REID.

Lovelock, Nevada, August 26.

Copper Phosphate in Cyanidation

The Editor:

Sir—At a time like the present, when we are straining to increase gold production, some observations I have made while employed, either as assayer or in charge of cyanide plants, on gold-silver properties may point out a possible trouble in other plants and work for good to the industry.

The mines referred to are the Relief mine, 25 miles north-east of Phoenix, the Empire mine, about six miles south of Marysville, Montana, and the Easton and Pacific group, six miles north-east of Virginia City, also in Montana. On the first two properties the owners were cyaniding tailing, the third one was crushing the ore to about 24-mesh, concentrating on vanners and cyaniding the tailing, leaching the sand and agitating the slime, then settling and decanting.

In all three plants the zinc-boxes at times caused much trouble. At such times the presence of copper was emphasized, selective precipitation was marked, also accumulations of a granular precipitate that settled with the bullion mud and even formed large clods of the material in the lower compartments of the zinc-boxes. During one such period, at the Easton, when this trouble was at its worst, I went through the mine and investigated the appearance of the ore-faces trying to find an explanation of the difficulty. I noticed the particular greenish cast on certain streaks that appeared to be copper silicate, but upon testing the same they were found to be a copper phosphate. Since then, by working on the theory that phosphate was the evil, I have been able to recover the gold from rich sump-solutions that the operators were unable to treat.

My conclusion is that a reasonably strong cyanide solution, say 1½ lb. per ton of solution, will attract the copper phosphate, the copper going into solution as a double cyanide and the phosphate joining hands with the alkali. When the solution from the treatment vats is passed to the zinc-boxes, the sodium phosphate is split up by the nascent hydrogen formed at the time of precipitation of the metal on the zinc, with the formation of phosphene (PH_3). The presence of phosphene in the solution tends immediately to react on the unprecipitated metal in the solution, causing selective precipitation, the metals plating out approximately in the following order: gold, silver, copper, bismuth, antimony, arsenic; this condition going to the extent of even causing the precipitation of the metals in an amorphous condition, in which state they totally evade precipitation on the zinc and pass to the sump.

The few experimental tests made on these solutions using zinc-dust instead of shaving seem to indicate that the dust was the most efficient precipitant of these poisoned solutions. I suggested the use of lead acetate at the plant and was satisfied of possible improvement in recovery and increased ease of operation. However, the general superintendent could not see it, so the subject was dropped.

In conclusion, permit the suggestion that the use of lead acetate in leaching-vats together with a small amount of ammonium chloride or carbonate might keep the phosphate in leaching-vats where it belongs, thus possibly increasing extraction, eliminating trouble in the precipitation room, the melting-room, and at headquarters.

GEORGE D. DIEHL.

Phoenix, Arizona, August 16.

P. S. There was considerable copper phosphate in the ore from each of the mines mentioned.

EXPERIMENTS with the addition of limestone to a number of soils, are given by N. Kopeloff, in 'Soil Science.' Limestone ground sufficiently fine to pass a 200-mesh sieve was as effective as burnt lime. Increase in fineness of division of limestone from 20 to 40, 60 to 80, 100 to 200, and to finer than 200-mesh, caused a proportional increase in the yield and in the total nitrogen content of clover on several soils, and a corresponding decrease in the lime requirement. Limestone finer than 60-mesh required about 3 weeks, while 20-mesh limestone required more than 7 weeks to effect neutralization. An increase in the fineness of division of pulverized limestone caused an increase in the activity of the bacteriological processes of ammonification, nitrification, and nitrogen fixation. The increase in bacteriological activities with an increase in fineness of division of limestone may be correlated directly with the chemical factors involved, such as the rate of neutralization of acidity, and also the crop-yield. On light sandy soils, which leach readily, limestone ground to pass 60 to 80-mesh was more effective than finer material. The nitrogen content of the plant was, however, higher where finer limestone was used. An increase in the fineness of division of pulverized limestone was accompanied by a reduction in the lime requirement. An analysis of the drainage waters indicated that there was a decreased loss of NH_3 and NO_3 but an increased loss of calcium.

The Mining Engineer as Administrator

By F. W. HIRST, Editor of 'Common Sense', London

One of the outstanding personalities in the world today is neither king nor general nor professional statesman, but a mining engineer—Mr. Herbert C. Hoover, who is grappling with the giant's task of increasing and putting to their best use the food resources of the United States. In every country in the world, belligerent or neutral, the problem of food supply is one of increasing urgency, but nowhere is the task so complex or on so large a scale as in America. Since Joseph was commissioned to provide against impending famine in Egypt, no government executive has undertaken so heavy a responsibility of this kind as now lies upon the shoulders of Mr. Hoover. President Wilson could not possibly have made a better choice. In the whole of the War no enterprise, military or civilian, has been carried out with more efficiency than the work of the American Relief Commission, of which Mr. Hoover was the head. It was, therefore, no untried man whom the President appointed to be Food Administrator of the United States, but one who had already proved his skill and resourcefulness in dealing with a kindred problem. Mr. Hoover is still in his prime, and his autobiography is unwritten. But, in a volume published in America a few years ago, he has indirectly gone far to explain how it comes about that, in a time of crisis, a member of his own profession is likely to come to the front. This book incorporates a series of lectures and is entitled 'Principles of Mining.'

Most of it, of course, is purely technical, but in the final chapter on 'The Character, Training, and Obligations of the Mining Engineering Profession,' Mr. Hoover begins by pointing out that the distinctive characteristic of mining engineering over other professions akin to it is the vast preponderance of the commercial over the technical in its daily work. The services it renders are nowadays not so much advisory as executive. The modern mining engineer spends the greater part of his time not in concocting reports and preparing blue-prints, but in devising methods of finance and in constructing and managing works. At first he used to make his way up from the ranks of the workmen. Later, he passed through an apprenticeship. Today, the occupation of mining engineer has reached the dignity of a profession, and the heads of it must possess not only a wide knowledge of civil, mechanical, electrical, and chemical engineering, together with geology, but an acquaintance with economics and the humanities, and also the engineering sense, executive ability, business experience, and financial insight. In no other branch of engineering is this combination of qualities required to anything like so great an extent.

In the first place, says Mr. Hoover, the problem of determining the commercial value of the projects undertaken bulks more largely in the occupation of the mining engineer. Mines are operated only to secure an immediate profit. They often change owners several times during their career, so that they have to survive a periodic re-valuation. In works of public utility, on the other hand, the profit-and-loss phase hardly enters at all. The life of a mine is short. Its works are of no value when the mine itself is exhausted. Other engineers must build as solidly as they can, but the mining engineer has to consider whether a cheaper device will answer the purpose.

The next point suggests a close parallel with the task Mr. Hoover has now in hand. Other engineers, he reminds us, can better marshal in advance the factors with which they have to deal. But the mining engineer depends on many elements which must remain unknown. He has to deal with conditions buried in the earth. Especially in the case of metal mines he cannot know, when his works are initiated, what the size, mineralization, or surroundings of the orebodies will be. He must plunge into them and learn—and repent. He is confronted with the necessity of daily re-planning—again, surely, a reminder of the worries of a food controller. "Weary with disappointment in his wisest conception, many a mining engineer looks jealously upon his happier engineering cousin, who, when he designs a bridge, can know its size, its strains, and its cost; and can wash his hands of it finally when the contractor steps in to its construction. And above all, it is no concern of his whether it will pay."

Mr. Hoover rightly dwells on the fact that the mining engineer is called upon to direct and control large bodies of workers. Metal mines are usually situated at a distance from centres of comfort and culture—indeed, at the very outposts of civilization. In this matter Mr. Hoover can speak from his own experience, for he has directed mining enterprises all over the world—from Mexico to China. The mining engineer, as he points out, exercises practically a chieftainship over the mining community. He has to be a man of decision.

Those who know Mr. Hoover will recognize in the conclusion a favorite topic of his conversation. "The engineering profession generally," he writes, "rises yearly in dignity and importance as the rest of the world learns more of where the real brains of industrial progress are. The time will come when people will ask, not who paid for a thing, but who built it. To the engineer falls the work of creating from the dry bones of scientific fact the living body of industry. It is he whose intellect and direction bring to the world the comforts and necessities of daily use. Unlike the doctor, his is not the constant struggle to save the weak. Unlike the soldier, destruction is not his prime function. Unlike the lawyer, quarrels are not his daily bread. Engineering is the profession of creation and of construction, of stimulation of human effort and accomplishment."

CEMENT PRICES have been fixed by the War Industries Board, for Government use. These range from $1.57 to $1.97 per barrel, 3 cents below present prices, and are f.o.b. cars at 29 points in the country. The prices are for the remainder of 1918.

Conveyors

By ROBERT S. LEWIS

The belt-conveyor is an exceedingly simple and efficient carrier of loose material that is to be handled in a continuous stream and in large quantities. Grain, ore, coke, coal, and gravel are economically transported in this way. However, it is not necessary that the material be in loose form; filled sacks, loaded boxes, packages of various sizes, and even bundles of magazines, as practised by some of the largest publishing houses in the country, are handled by belt-conveyors. Within certain limits belt-conveyors can be used for elevating material. An interesting illustration of this use is to be seen in the crushing department of the new leaching-plant of the Utah Copper Co. The conveyors here are installed between the gyratory crusher, two sets of rolls in series, and the storage-bin, thus eliminating the troublesome bucket-elevator. Though belt-conveyors can be loaded or unloaded at any point along their length the most economical operation requires that they should be loaded at one end and discharged at the other. When properly installed and cared for they are reliable, and their flexibility, as well as their large capacity, makes them a satisfactory means of transporting material. Where a steady and continuous delivery of material is desired the belt-conveyor is unequaled by any other device. It is not an efficient machine for intermittent work, nor is it to be recommended where the discharge must occur at a number of points, because heavy wear is entailed by several trippers. The belt should always be loaded to its capacity.

DETAIL OF BELT. A rubber-covered belt is generally used. Steel bands, woven cotton, and stitched canvas, have been tried but have not proved satisfactory for handling wet material. Belt-conveyors are sooner or later subjected to the action of moisture, in mining work, and only rubber-covered belts will resist moisture successfully. Balata, a vegetal gum from Venezuela and the Dutch East Indies, is similar to rubber, but has greater tensile strength and deteriorates but slowly. However, its higher cost and the careful manner in which it must be worked, have operated against its extensive use.

Belts are made by covering a layer of duck with rubber, or 'friction,' as it is called. The duck is then cut to the desired width, the requisite number of plies are placed together and the rubber cover is laid on. The finished belt is then made by running the whole through the vulcanizing-press, the heat and pressure making a compact and solid belt. The tensile strength of a belt depends upon the weight of the duck used in its manufacture. Duck comes in weights ranging from 28 to 36 oz., the weight applying to a piece 42 in. wide by 36 in. long. A first-class belt should contain nothing lighter than 30-oz. duck. The life of a belt depends upon the protection offered by the rubber cover in keeping out the moisture, which, having once entered the canvas, causes the plies to separate and the cover to loosen or blister, and to lessen the strength of the 'friction' to hold the plies together, especially when passing around the pulleys.

It is not a difficult matter to keep an accurate account of the performance of any belt-conveyor nor to make a few informing tests on a new belt, yet it is not often that an authentic record of performance can be found. The data obtained are generally carried in the head of the foreman or superintendent of the plant, and are often unreliable because of personal prejudice in favor of or against the goods of a certain manufacturer. A good form of record, proposed by the B. F. Goodrich Co., is shown below.

Company	Place where used	
Plant	Conveyor	
Width of belt	Material	Sketch of conveyor
Length of belt	Maximum size	
Number of plies	Minimum size	
Top cover	Wet or dry	
Back cover	Average hours per day.....	
Furnished by	Speed	
Order number	Drive	
Manufacturer	Load applied at	
Brand	Number of loading points..	
Price per foot	Length centre to centre....	
Date received	Difference in elevation.....	
Date put on	Angle of incline	
Date taken off	Trippers	
Length of service		
Cost of belt		
Repairs: Labor		
Material ...		
Total cost		
Total tons handled...		
Cost per ton		

The following tests, recommended by the Robins Conveying Belt Co., can be carried out by means of a spring-balance, small clamps, and a cutting-die for the rubber cover.

1. Binding strength of the 'friction.' Cut from the end of the belt a strip exactly one inch wide. Commence at the back or bottom of the strip and about three inches from one end, after marking on the strip, with ink, distances one inch apart; cut and pry loose the outer ply for about one inch. Hook the spring-balance into the ply and pull with the balance until a weight equal to the specified strength of friction is indicated. With this tension kept uniform, the rate of separation of the plies should not exceed one inch per minute.

2. The strength of adhesion of the rubber cover is found in the same way.

3. Strength and elasticity of the rubber cover. For this test remove a piece of the cover and cut it, by means of the die, the size and shape shown in Fig. 1. Gauge

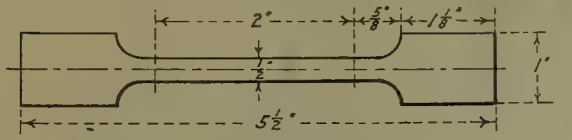

FIG. 1. CUTTING DIE

the thickness with a micrometer, allowing for projections caused by the impressions of the duck on the under side. Mark with ink on the strip a distance of two inches. Attach clamps and apply a steady pull until the two marks have been stretched apart a specified distance, say from four to six inches. Relax the tension, and immediately measure the distance between the marks. The increase over two inches is the 'immediate set,' which should not exceed the specified amount. The tensile strength of the cover is next obtained by stretching until the piece breaks. If P is the pull in pounds shown on the balance at the time of breaking, and T is the thickness in inches of the cover, the tensile strength per square inch, the strip being $\frac{1}{2}$ in. wide, is

$$S = \frac{2P}{T}$$

4. Strength of duck. This can be determined only in a testing-machine. Manufacturers will give this value upon request.

The exact value of the data obtained changes with the kind and make of belt tested, and is a matter of specification with the manufacturer. Records of tests compared with the performance of belts will indicate how a belt can be judged before it is used. In regard to the first test, it may be said that poor belts will begin to strip under a pull of 7 or 8 pounds per square inch. A well-made belt may show a resistance as high as 26 lb.; a good average is 16. A belt should be made for the particular work it is to do; consequently one set of specifications will not serve for all belts. The tests will show whether a belt comes up to the specifications.

Stepped belts have a greater number of plies at the edge than at the middle, and the rubber cover is correspondingly thicker at the centre of the belt. This construction makes a belt that is very resistant to abrasion and one that does not bend greatly between the troughing idlers. Roughly speaking, belts with a $\frac{1}{8}$-in. rubber cover at the centre have plies at this point one less in number than at the edges. Belts with a $\frac{3}{16}$-in. cover at the centre have a difference of two in the number of the plies between the centre and the edges. Where the difference in plies is two, the belt may be considered as the equivalent of a straight belt having one less than the maximum number of plies at the edges. Thus a 40-in. stepped-belt of 9 and 11 plies would be equivalent to a straight belt of 10 plies.

The following table gives the weight in pounds per foot of straight belts with $\frac{1}{8}$-in. cover, as prepared by the Robins Conveying Belt Company.

Width, inches	Number of plies					
	3	4	5	6	7	8
12	2.4	2.6	2.8	..	..	..
14	2.7	3.0	3.3	3.6	..	..
16	3.0	3.4	3.8	4.1	..	..
18	3.4	3.8	4.2	4.7	5.1	..
20	3.7	4.2	4.7	5.2	5.6	6.1
22	..	4.7	5.2	5.7	6.2	6.7
24	..	5.1	5.7	6.2	6.8	7.4
26	..	5.5	6.1	6.7	7.3	8.0
28	..	..	6.6	7.3	7.9	8.6
30	..	..	7.1	7.8	8.5	9.2
32	..	..	7.6	8.3	9.1	9.8
34	..	..	8.0	8.8	9.6	10.4
36	..	..	8.5	9.3	10.2	11.0
38	..	..	9.0	9.8	10.7	11.7
40	..	..	9.4	10.4	11.3	12.3
42	..	..	9.9	10.9	11.9	12.9
44	..	..	10.4	11.4	12.4	13.5
46	..	..	10.8	11.9	13.0	14.1
48	..	..	11.3	12.4	13.6	14.7

WIDTH OF BELT. Three factors must be considered in determining the width of a belt: the size of the largest piece carried, the speed of the belt, and its capacity. Where large lumps are to be carried, their size, rather than the number of tons per hour to be transported, fixes the width of the belt. Obviously, the capacity of a belt varies with the speed. The relation between these factors is shown in the following equation:

$$\frac{c_1}{c_2} = \frac{v_1 (w_1)^2}{v_2 (w_2)^2}$$

where c = capacity in tons per hour, v = velocity in feet per minute, and w = width of belt in inches. Thus, for two belts run at the same speed their capacities vary as the square of their widths.

PULLEYS AND DRIVES. All pulleys should be at least two inches wider than the belt. Owing to their slow speed and the heavy stresses to which they are subjected, pulleys should be made extra heavy and in a single piece. Sectionalized pulleys are a never-failing source of trouble. For heavy drives lagged pulleys are best. Rubber lagging increases the tractive force of pulleys nearly 40%, and is generally used unless the material handled is very wet, in which case wood lagging is to be preferred. Heavy keys and two set-screws, one over the key and one on the shaft, ensure a solid fastening to the driving shaft.

As mentioned above, the bending-stresses in a belt, as it passes around a pulley, shorten its life, just as bending around the head-sheave affects the life of a hoisting-rope; consequently pulleys of small diameter should be

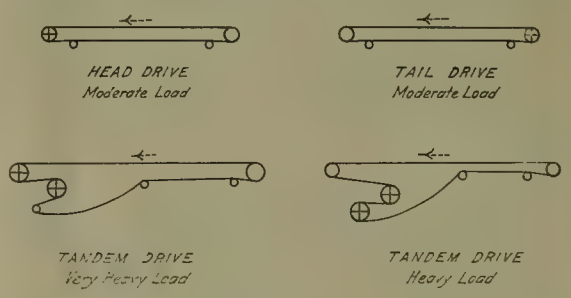

FIG. 2. TYPES OF CONVEYOR DRIVES

avoided. A good rule is to have the diameter of the pulleys not less than 5 or 6 in. for each ply of belt. A three-ply belt would then have a pulley of from 15 to 18 in.

diameter. Some engineers recommend a diameter of 8 in. per ply.

The conveyor-drive is most commonly placed at the head or discharge end, though, if necessary, the drive may be placed at the tail end or at any intermediate point. Four types of drive are in general use; single bare pulley, single lagged pulley, double bare pulleys, and double lagged pulleys. Some arrangements of pulleys are shown in the sketches on the preceding page.

CAPACITIES, PLIES, AND HORSE-POWER. Charts No. 1, 2, and 3 have been devised by the Robins Conveying Belt Co. Chart No. 1 gives the capacities and recommended belt-speeds for various widths of belt. Enter the chart at the left margin with the load in tons per hour, and pass horizontally to intersect the diagonal for the weight of material per cubic foot; then go vertically down the diagonal for the width of belt. A horizontal line from this point cuts the proper speed at the right margin. The width of the belt, and the speed, can be changed until a suitable combination is found. In case large lumps are to be handled, their size will govern the width of belt. The solution shown on the chart is for undersized material containing 8-in lumps. The belt-width is 24 in., the speed is 240 ft. per minute, and the capacity is 225 tons per hour of material weighing 100 lb. per cubic foot. If the lumps were 14 in. a 30-in. conveyor, operating at a speed of 160 ft. per min., would be indicated. The diagonals for the width of belt are terminated at the maximum advisable speeds, and caution should be used in exceeding these figures. Most belts are run at speeds between 250 and 400 ft. per min. Sorting-belts are run at much lower speeds, from 25 to 50 ft. per minute.

Chart No. 2 gives the horse-power for belt-conveyors. The width of the belt and the speed having been determined, the chart is entered at the upper left margin with the weight of the material handled in pounds per cubic foot. Pass vertically down to cut the diagonal for the width of belt, then horizontally to the speed in feet per minute; next, go vertically down to cut the diagonal for the length of the conveyor (centre to centre); lastly, passing horizontally to the left margin to obtain the horse-power required for the fully-loaded belt. The power required for a lightly-loaded belt will be less than this, but a motor should be installed to handle a belt fully loaded. For inclined conveyors add 1/1000 of a horse-power for each foot ton of lift per hour. The solution given is for a fully-loaded level conveyor, 36 in. wide, 300 ft. long, and carrying material weighing 50 lb. per cubic foot, at a speed of 250 ft. per minute; 18 horse-power is required. This power is for the conveyor alone. It should be remembered that for a large driving-pulley, slow belt-speed, and high motor-speed, the loss in gear-reduction may reach 40%. It rarely falls below 15%. The conveyor itself will show a 30 to 50% friction loss on a bare pulley. The power required for operating an empty conveyor will range from about 35% of full-load power for belts from 36 to 48 in. wide to 45% for belts from 12 to 24 in. wide. These figures are based on the assumption that the ore weighs from 100 to 125 lb. per cubic foot. Trippers will require, roughly, about 1 hp. for belts up to 24 in. wide,

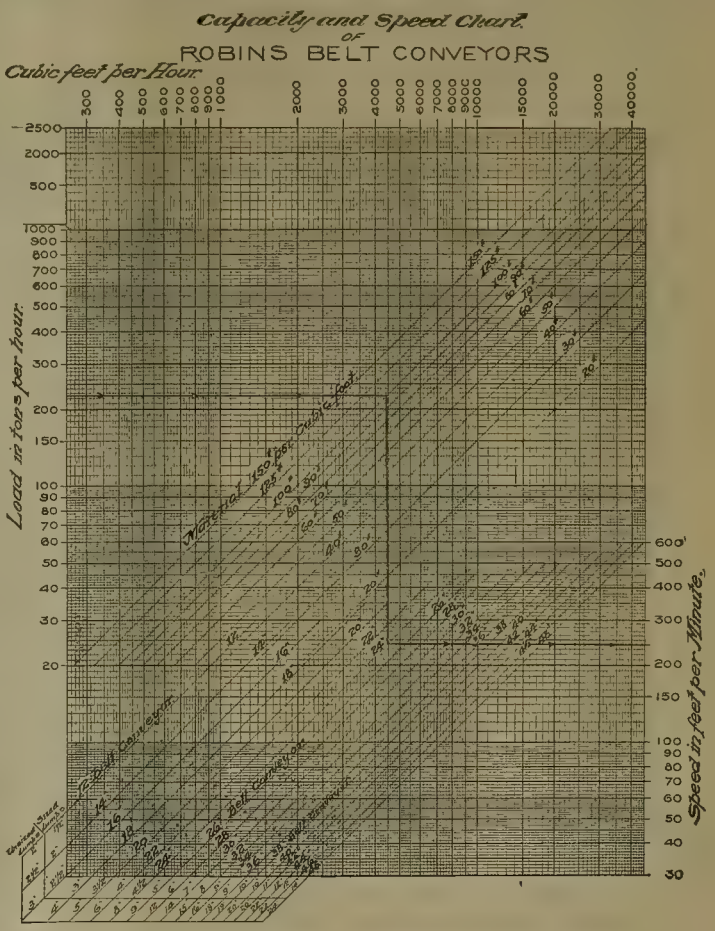

CHART No. 1. CAPACITY AND SPEED OF BELT-CONVEYORS

and 2 hp. for wider belts, when the conveyors are operated at moderate speeds, say, 300 ft. per minute. R. L. Streeter, in the 'Engineering Magazine' for January 1916, gives the following empirical rule for the power required for trippers. $HP = \frac{W-10}{8}$, where HP is the horse-power required and W is the width of the conveyor-belt in inches. The results obtained from this formula are somewhat high for low speeds, but are quite satisfactory for speeds as high as 600 ft. per minute.

To find the number of plies when the horse-power, speed, width of belt, and type of drive are known, use Chart No. 3. Enter the chart at the left margin with the horse-power required, and pass horizontally to cut

the diagonal for the speed of belt, then down vertically to the type of drive used; next pass horizontally to the diagonal giving the width of belt. The number of plies required is at the bottom of the chart vertically below this point. The chart gives the solution for 15 hp., a 24-in. belt, and a speed of 250 ft. per minute; 6.8 plies are indicated as required, and this means a 7-ply straight belt. The plies thus found ensure a proper strength of belt for the pull it is to stand. A rough rule is that the working-tension should not exceed 20 lb. per inch of width per ply.

The following formulas are given by the B. F. Goodrich Company:

Let p = correct number of plies.

k = constant depending upon type of drive.

g = weight of material in pounds per cubic foot.

W = belt width in inches.

L = total length of belt in feet (roughly twice the distance between centres).

H = difference in elevation between head and tail pulleys in feet.

U = capacity in tons per hour.

S = speed in feet per minute.

HP = horse-power developed in driving the belt.

L' = length of conveyor in feet, or $\frac{1}{2}L$.

T = total tension in belt in pounds.

C = constant depending upon type of drive.

$$(1) \quad p = k\,g\,W\,(L + 10H)$$

$$(2) \quad U = \frac{0.08\,W^2\,S\,g}{5000}$$

$$(3) \quad T = \frac{C \times HP \times 100}{S}$$

$$(4) \quad HP = \left(\frac{0.02\,L'}{100} + \frac{0.01\,H}{10}\right) U$$

$$(5) \quad p = \frac{T}{24\,W}$$

Type of drive	Value of k	Value of C
Simple bare pulley	1/250,000	600
Simple lagged pulley	1/300,000	500
Tandem bare pulley	1/375,000	400
Tandem lagged pulley	1/445,000	330

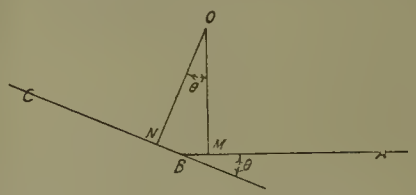
The charts and formulas give results that represent fair averages, and ensure the proper number of plies to withstand the pull upon the belt. If the number of plies indicated is only one or two, it is obvious that, though sufficiently strong for any tensile stresses, the belt would not have the necessary stiffness between the troughing idlers. The smallest number of plies that a belt of a given width should have are given below.

Width, inches	Plies	Width, inches	Plies
12–16	3	32–36	6
18–24	4	36–48	7
26–30	5		

A belt that is too stiff will not conform to the shape of the idlers, and will wear out rapidly at the edges. A belt having an insufficient number of plies will be so flexible that it will flatten between the idlers, and the banding may crease the belt down the centre and start the separation of the plies along this line. The weight of a properly designed belt should cause it to conform to the shape of the idlers.

Inclined Conveyors. The charts and formulas are suitable for inclined conveyors as well as for those that are horizontal. In general, fine material, or lumps mixed with fine, can be handled on steeper angles than closely sized material. A uniformly loaded conveyor can be operated at a steeper angle than one which carries an intermittent load. Fine material has been successfully carried at an angle of 22° from the horizontal, but the limiting angle for ore should not be greater than 18°. This will effectually prevent any material from running back on the belt.

It may be necessary sometimes to place a vertical curve in a conveyor. This saves installing an additional conveyor, though, for other reasons, it may not be the most desirable solution of the problem. Care must then be taken that the belt does not rise above the idlers on the curve. This condition is most likely to occur when the part of the conveyor below the curve is loaded and that on and above the curve is empty. This danger will be avoided if conveyors, not over 30 in. wide, are installed with a curve of 250 ft. radius, and wider conveyors with a curve of 300 ft. radius. In order to determine the shortest possible radius that such a curve may have, the weights per lineal foot of the empty and



loaded conveyor must be known. The curve then can be calculated from the equation of the catenary. To find the ends of a curve when the radius is known, let AB and CB be the two directions of the conveyor between which the curve is to be installed, and let Θ be the angle between these lines. If R is the radius of the curve in feet, distance BM = distance $BN = R \tan \frac{1}{2}\Theta$. Erect perpendiculars at N and M, and their intersection gives the point O, or the centre from which the curve can be drawn.

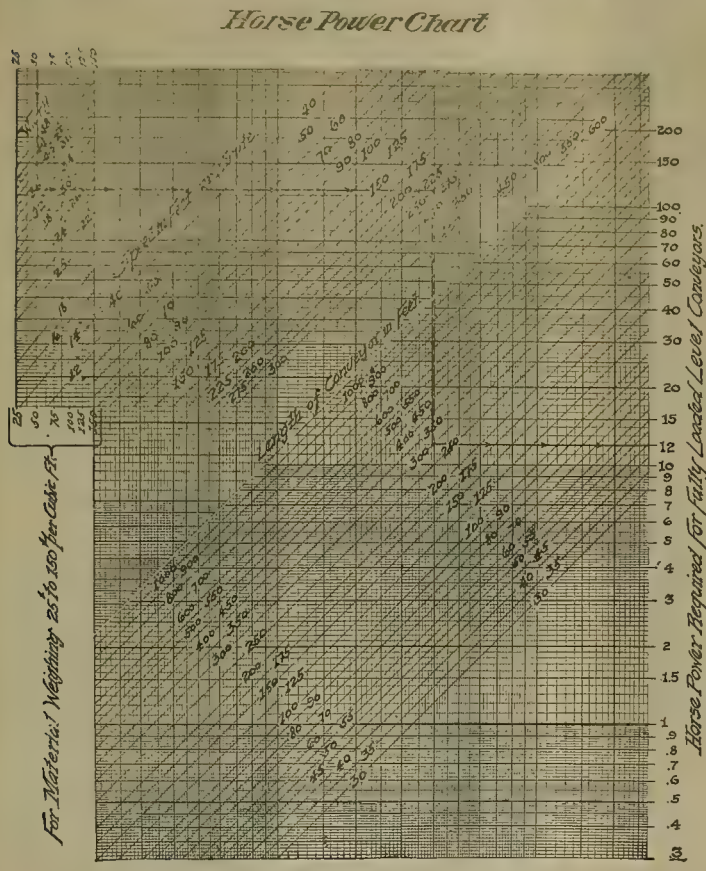
Idlers. The spacing of troughing-idlers should bear a relation to the weight per cubic foot of the material carried. The heavier the material, the closer should be the spacing of the idlers. At the loading-points it is advisable to have the idlers placed at one-half of the usual spacing. The spacing to be recommended for troughing-idlers to convey material weighing 125 lb. per cu. ft. is given below:

Width, inches	Spacing, feet	Width, inches	Spacing, feet
12	4.5	28	3.5
14	4.5	30	3.0
16	4.5	32	3.0
18	4.0	34	3.0
20	4.0	36	3.0
22	4.0	40	3.0
24	4.0	44	3.0
26	3.5	48	3.0

Return-idlers are commonly spaced 10 to 12 ft. apart. Idlers are generally cast-iron pulleys mounted on hollow

shafts made of cold-drawn seamless tubing. Grease-cups on the ends of the shafts serve to force the grease through holes in the hubs of the pulleys and thus form protective rings, which effectually exclude the dirt. Steel pulleys having ball or roller bearings and using oil lubrication are economical where costs of power are high.

INSTALLATION AND USE. If the material is fed upon the belt in the direction of its travel and at the same speed, the wear on the rubber cover will be considerably reduced. This can be accomplished by suitably arranged chutes. If the material contain sharp lumps a grizzley or screen can be placed in the bottom of a chute close to the end. The fine material will then form a protective layer on which the lumps fall. It is not a good plan to put a chute where it supplies feed to a belt either directly over an idler or to one side of the centre of the belt. In the latter case, the belt will not run true on the idlers, but will work to one side. Chute-boards and pieces of belt, used for guides, should not touch the conveyor. Guide-idlers cause rapid wear of the edges of the belt, and are not necessary if the troughing-idlers are placed at right angles to the line of travel of the belt and are carefully maintained in this position. The belt will then show no tendency to travel to one side. If the belt runs to one side, it is the third idler back that needs to be straightened, and not the one at which the side-travel appears. Idlers should be kept well greased. Whenever they run hard, or stick, both the power required by the conveyor and the wear of the belt are increased. The return part of the conveyor is covered to prevent pieces of material falling from above and getting between the belt and the return-idlers, which would injure the belt. It is advisable to examine the belt about once each week for cuts in the cover. If these holes are cleaned out with gasoline, thoroughly dried, and then plugged with good rubber cement, the life of the belt will be materially lengthened. Moisture that once gets under the rubber cover causes the plies to separate and the duck to rot. Unless all brushes and scrapers for keeping the return part of the belt clean are maintained in good condition they are of little service.



Horse Power Chart
For Materials Weighting 25 to 150 per Cubic Ft.
Length of Conveyor in Feet
Horse Power Required for Fully Loaded Level Conveyors

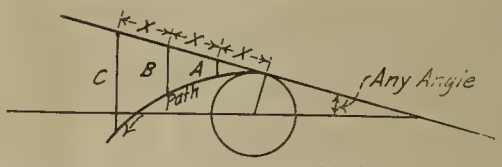
CHART NO. 2. HORSE-POWER OF BELT-CONVEYORS

Loaded incline-belts will run backward and pile up their loads at the bottom whenever the driving-power fails, unless a check be provided. Some excellent safety-devices are on the market. A simple one consists of a large ratchet-and-pawl placed at the head of the conveyor. The pawl catches on a tooth of the ratchet and stops the conveyor as soon as the belt starts to run backward. To prevent undue strain upon it, a belt should be run just tight enough to prevent slipping, and no tighter. Care must be exercised to adjust the take-ups at the tail-pulley equally, or the belt will not run straight. Like the independent adjustment on rolls, it is not easy to move the two sides exactly the same distance.

To splice belts, cut both ends square and bring them together by means of belt-clamps. Mark the belt lightly with the points of the metallic belt-lacing or hooks, but do not drive the lacing in until the holes have been punched with an awl. Then drive in the hooks, supporting the belt on a block of soft wood. Turn the belt over, remove the block and clinch the lacing toward the joint. Before splicing, it is a good plan to coat the ends of the belt with rubber cement to keep out moisture. The following sizes of Bristol belt-lacing or their equivalent are recommended:

Ply of belt	Size of lacing, No.	Ply of belt	Size of lacing, No.
3	113	7 and 8	117
4 and 5	114	9, 10, and 11	119
6	115		

The trajectory of the material delivered by a conveyor is of value in designing discharge-hoppers or chutes.



The distance X in inches $= \frac{\text{speed in feet per minute}}{100}$

The different vertical distances from the projected line of travel of the belt to points on the path of the falling

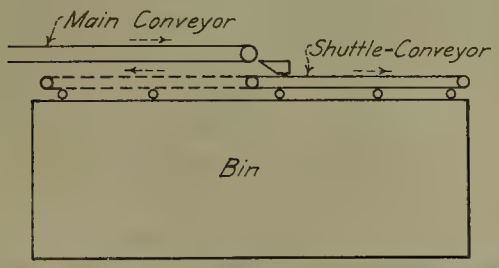
particles is shown in the accompanying table, prepared by the Jeffrey Conveyor Company:

Distance	Inches	Distance	Inches
A	0.4284	H	30.8736
B	1.9296	I	39.0744
C	4.3416	J	48.2450
D	7.7184	K	58.3704
E	12.0600	L	69.4556
F	17.3664	M	81.5256
G	23.6376	N	94.5504

The values given in the table will not hold good for material that sticks to the belt or is so light that it is easily deflected by the resistance of the air.

In selecting a conveyor-belt, the tonnage carried and the length and lift of the conveyor must be considered in connection with the number of plies, width, and speed of the belt. A belt should be designed to run fully loaded to ensure the greatest economy of operation. It is evident that the same belt will not be suitable for various lengths of conveyors. One company installed an additional conveyor half the length of the one already in operation, and was surprised not to get equal wear from the belt. The more frequent bending over the pulleys, and the greater abrasion from loading, since each part of the belt came under the chute twice as often as with the long belt, caused rapid wear. Since the operating tension in the short belt was less than for the long belt a smaller number of plies, with a heavier rubber cover, was indicated for this conveyor.

Automatic trippers, though mechanically efficient, are not the most desirable means of discharging a conveyor, as they entail heavy wear on the belt. The comparatively small pulleys of the trippers cause additional bending-stresses and, because of imperfect cleaning, the material that sticks to the belt is pressed into the rubber cover by the second pulley. A shuttle-belt discharge is not open to these objections. The short belt, a little longer than one-half that of the bin, runs on a track and is moved back and forth, either mechanically or by hand. The main conveyor, extending to the middle of the bin, discharges upon the shuttle-conveyor, which can be run



in either direction, thus being made to deposit its load at any desired place.

Repair, renewal, and lubrication-charges on belt-conveyors are not difficult to determine, but depreciation is a complicated problem. Reginal Trautschold, in the 'Engineering Magazine,' August 1916, states, in part, that "depreciation is due not only to wear but to constant and quite apparent continuous deterioration of the belts, whether they are in use or not, so that the depreciation charge is little affected by careful use, provided, of course, the equipment is operated a reasonable amount of the time. This deterioration is largely due to the hardening of the rubber cover and the loss of resilience, and is more apt to be accentuated by idleness than by careful use. The balance of the mechanism is not more greatly affected than other mechanical equipment, if well cared for and not abused. Ordinarily a depreciation charge of 25% on the belt and 10% on the balance of the equipment covers all reasonable wear and tear." His discussion is concerned with conveyors in manufacturing plants. Conveyors in mining and milling are subjected to such hard usage and receive so little proper

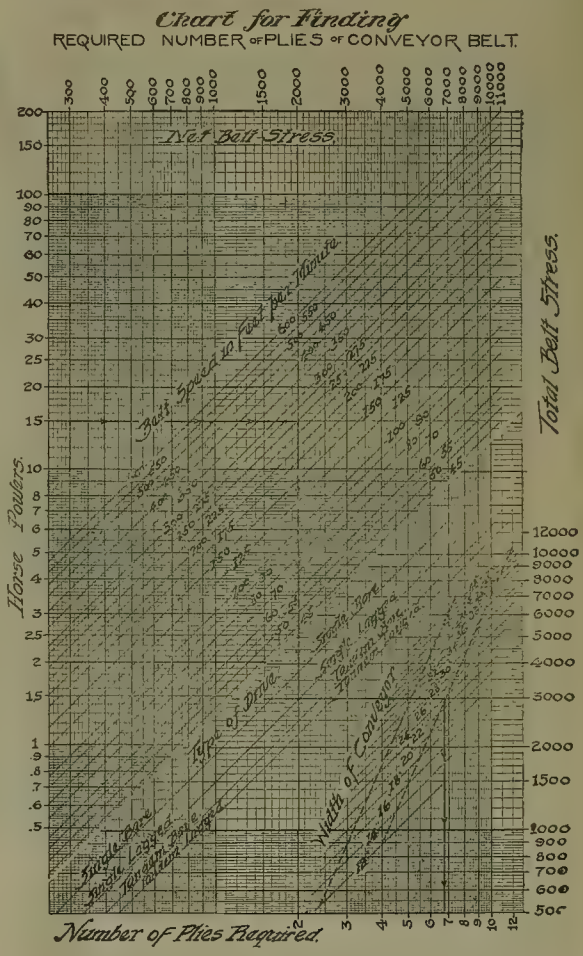


CHART NO. 3. PLIES IN BELT-CONVEYORS

care that their depreciation is undoubtedly far greater than that given above.

APRON AND PAN-CONVEYORS. Modern ore-crushing plants have such large capacities that great tonnages of coarse material must be handled by the conveyors. The heavy wear and the enormous strains to which they are subject make it necessary to replace belt-conveyors with those of a stronger type. For this work, apron-conveyors and pan-conveyors are now largely used. The apron-conveyor consists of a series of steel plates that overlap to form a continuous surface. The plates are carried between two heavy roller-chains, and are rigidly attached

to the inner links. In the large sizes, the plates are supported on cross-bars between the links. A rail on each side carries the rollers. All the framework is of steel. Large sprockets at the ends are used for turning the conveyor. For horizontal work, the overlapping plates are but slightly curved, and the surface of the conveyor is nearly flat. Where cross-bars are used, the plates between are flat. This type is also suitable for work on slight inclinations. For steeper grades the plates are made deeper, and take the form of pans, which may be shallow or deep. For steep grades and for vertical lifts the pans are pivoted, and the conveyor becomes a bucket-elevator. The steel construction of these conveyors guarantees strength to withstand the heavy strains put upon them. The pans can be lined with renewable wooden planks or cast-iron plates, the conveyors thus being protected from wear. The slow speed of these conveyors, from 25 to 100 ft. per min., 75 ft. being a good average, minimizes the wear on the mechanism. Their capacity can be made to suit any requirement; 1500 tons per hour has been carried, and there should be no practical difficulty in handling a larger tonnage. Short conveyors of this type, from 5 to 10 ft. long, are used as feeders. They are run at speeds from 10 to 30 ft. per min., and are placed close to the openings in the bottom of the bins. No gates are required, as the variation in the speed of the feeder regulates the flow of the ore.

Push-Conveyors. Such a conveyor consists of a series of hinged flights attached to a moving frame or carrier. During the forward movement of the carrier, the flights project into a trough and push the material along. On the return stroke, the flights turn up and slide back over the top of the material. This type of conveyor is always of short length, and has a limited use in confined spaces. The moving frame is carried on rollers. The stroke is from 2 to 4 ft. In one mill, two push-conveyors, about 20 ft. long, handled 1000 tons of ore per day. The ore, crushed to $\frac{3}{8}$ in., was supplied to the conveyors by Challenge feeders. The steel flights were $8\frac{1}{2}$ in. wide, 18 in. long, and $\frac{1}{2}$ in. thick; the width of the trough was 22 in.; the length of stroke was 24 in.; and the flights were spaced 18 in. apart to give a 6-in. overlap. The rollers were 8 ft. apart. It was found that the smoothest operation of a conveyor was obtained when the ore was fed at a point about 5 ft. from the end.

Flight-Conveyors. These conveyors consist either of an endless chain or of two roller-chains to which are attached, at intervals, flights or scrapers of various shapes that drag the material along a trough. Their field of operation is confined to relatively small conveyors; the material handled should be non-abrasive, and should have a low co-efficient of friction, such as grain or coal. Wear is caused by the friction of the conveyor on itself as well as by the material carried. The speed of these conveyors varies from 100 to 200 ft. per minute, and they are used on inclines up to 45° from the horizontal. The capacity depends upon the size and spacing of the flights and on the speed. Flights range in size from 4 to 10 in. to 10 by 24 in., and the spacing from 16 to 24 in. For handling coal, the horse-power required $= \frac{ATL + BWS}{1000}$

Where T = tons per hour.
L = length in feet.
W = weight of conveyor (chain and both flights), in pounds.
S = speed in feet per minute.

Table Giving Value of A and B

Deg. from horizontal	A	B	Deg. from horizontal	A	B
0	0.343	0.010	25	0.730	0.009
5	0.420	0.010	30	0.790	0.009
10	0.500	0.010	35	0.850	0.008

8 " 20	...	...	64.5	51.8	41.0	34.5
8 " 24	...	...	83.2	74.0	59.1	44.4
10 " 24	...	...	106.0	92.5	74.0	55.4

Spiral Conveyors. These consist of a steel ribbon wound in a spiral around a shaft, interrupted at intervals of 8 to 10 ft. for bearings that are 2 to 3 in. long. In the small sizes the spiral fits close to the shaft, but in the larger sizes a narrow ribbon is attached to the shaft by studs. The depth of material is generally taken as one-third the diameter of the screw. The power required varies so greatly with the nature of the material handled that formulas give only approximate results. The weight of material per cubic foot is not always a true measure of its frictional resistance. It is customary to design these conveyors so that the pitch of the screw shall equal the diameter of the conveyor. Because of the great torsional strain involved, lengths are not made greater than 100 ft. For longer distances several conveyors are used in series. Maintenance-charges are high if the material handled is gritty. It is a good plan, with such material, to make the trough large, and to let the material form its own trough. The relatively low first cost and the small space occupied are the chief advantages of this type of conveyor. Coal, coke, ashes, cement, sand, gravel, and crushed stone not over one inch in size are some of the materials that may be handled by spiral conveyors.

$$\text{Horse-power} = \frac{K \times C \times W \times L}{2{,}000{,}000}$$

Where W = weight per cubic foot.
L = length in feet.
C = capacity in cubic feet per hour.
K = 1.2 for grain.
2.5 for fine ashes, cement, etc.
4.0 for sand, coarse, ashes, etc.

The following table, supplied by the Caldwell Co., gives the capacity of spiral conveyors corresponding to their diameters and the appropriate speeds.

Size, inches	R.p.m.	Cu. ft. per hr.	Size, inches	R.p.m.	Cu. ft. per hr.

MAP SHOWING POSITION OF IRON DEPOSITS IN SANTO DOMINGO

Iron in Santo Domingo

By ROBERT B. BRINSMADE

Among the large tropical islands of the West Indies there are none which excel Santo Domingo in picturesqueness of scenery or salubrity of climate. These enchanting endowments are the result of its geological history. The island was formed on the high Cibas range as a backbone, and with its auxiliary ranges disposed as ribs, so that when the body was finally fleshed and made presentable as hill and vale, there was everywhere a soil prolific of riotous vegetation and a drainage nearly ideal for human health. The landscape of much of the interior wilderness reminds one of nothing so much as old prints of the Garden of Eden.

The area of the island is 28,249 square miles, making it nearly as large as South Carolina. Strangely enough the denser population is crowded into the western third of the area, which comprises the Republic of Haiti, with 2,000,000 people, while the Dominican Republic, or Santo Domingo, has only 600,000 inhabitants, and these mostly are concentrated in the seaports. This distribution of the population explains why so much of the interior is covered with primeval forests, with only the occasional cocoa and tobacco plantations of the principal valleys and the meadows for cattle and the sugar brakes of the coastal plains to indicate the presence of man.

Santo Domingo is called the mulatto republic, but most of its people are as black as ebony and can be distinguished from their rivals in Haiti only by speaking Spanish instead of a barborous dialect that was once French. In fact one sees so few light complexions in the interior that black becomes the normal color, and on emerging at a port the white faces appear sickly and almost as unnatural as the chalk-like skins of albinos. The Indians seem to have disappeared entirely; only occasionally does a black face show the red tinge of aboriginal blood. The vice of pilfering is less prevalent in Santo Domingo than in many more highly developed Latin-American countries. This is probably explained by the fact that the masses have never been reduced to peonage as in the countries where a monopoly of land prevails as in Mexico. Most of the older native families have some hereditary rights in the land as comuneros, being descendants of the original grantee of an estate from the Spanish Crown, whereby they are entitled to use any part of the family inheritance that is not already under cultivation. Nevertheless the bulk of the people are but partly domesticated savages, and as such they offer a prolific recruiting ground for the shameless native politicians, whose tumults and rivalries have cursed Dominica for the past century. It is the slaughter of the civil wars, not only of men but of cattle, that has kept the interior a wilderness. Under the treaty of 1907 the United States took charge of the custom houses with the idea of stopping revolutions by shutting off their source of money and arms. For several years this scheme seemed hopeful; but the richness of the island as a source of easily-grown supplies for bandit troops had been forgotten, and conditions rapidly grew worse after the assassination of President Cáceres in 1911, himself the butcher of President Heureux, who had been the island's despot for 20 years. By 1914 the treaty of 1907 had been proved practically useless as a means of checking disorder, for the fifth president had been ousted by violence within the space of one unexpired six-year term. Abandoning moral suasion at long range, the United States finally, in October 1914, sent the Fort Commission to supervise the coming presidential election. Though the peoples' choice, Juan I. Jiménez, was declared elected and duly installed, he soon found his job untenable, and in May 1916 he fled for refuge to our Admiral Knapp, anchored in Santo Domingo harbor. During the summer

of 1916, in order to protect foreign interests, the U. S. Marines captured and garrisoned, with little loss of life, every strategic port and interior town, so that the proclamation of martial law and the assumption of government by Admiral Knapp, in the autumn, simply registered an accomplished fact. Since then the treaty of 1907 has been extended to include the policing of the interior and the control of public expenditures by the United States. At present Santo Domingo is as much a Yankee protectorate as its sister Haiti and the miner need fear no more molestation nor forced loans for the benefit of political 'liberators' than he would in Porto Rico or the Philippines.

In preparing for my trip to Santo Domingo I was unable to find any information concerning its iron deposits beyond the report of the American geologist, W. M. Gabb, who made a survey for the native government, in the decade following 1870, and published a summary in the Transactions of the American Philisophical Society for 1881. Gabb's description is highly misleading, but I quote it as an example of the guesswork that often passes for solemn fact in the transactions of reputable scientific societies. He says:

"On the banks of the Yuna river near Hatillo is a mountain of magnetic iron ore, 100 ft. high, 300 to 400 ft. wide, and many hundred feet long. Three miles westward, across the river, is a second great lens. Owing to the suspicion of the natives, I was unable to obtain a guide to show me the two or three other deposits reported to exist in the vicinity. Samples of the ore I sent to Columbia University for analysis, and they reported 67 to 70% iron and great purity.... Slack-water navigation can be practised on the Yuna below the mouth of the Camu river with less difficulty than in the Schuylkill river in Pennsylvania. From the Camu junction to Hatillo is only 20 miles, and in the dryest seasons the Yuna here is deep enough to float barges anywhere except on the few rapids. These rapids are simply gravel banks that could be made deep enough by confining the stream in a narrower channel or by the use of a dredge. Not a single reef exists in the Yuna from Hatillo to the sea or any difficult descents like the rapids of the Ohio river."

I landed first at Monte Cristi on Manzanillo bay, the westernmost port on the north coast of Santo Domingo. This town marks the western end of the interior east-west valley, which separates the low northern coast or Monte Cristi range, folded from Miocene shales, from the island's backbone, the lofty Cibao.(1) This valley is rather flat, about 140 miles long and 10 to 30 miles wide; its divide is nearly at its centre, near the city of Santiago, whence the Yaqui river flows west to Monte Cristi and the Yuna river in the opposite direction to Samana bay at the eastern end of the island. As the coast range tends to cut off the wet north-east trades from the valley, the rainfall gradually increases eastward from the desert aridity of Monte Cristi to the tropical dampness of the lower Yuna region. My second stop was at the picturesque Puerta Plata, at the foot of the verdure-clad coast range, and, like Monte Cristi, so shallow as to require lighters for handling freight from steamer to shore. Thence following the narrow green coastal plain to the east and rounding the end of the coast range the steamer turned into the well-protected entrance of Samana bay, one of the largest natural harbors on the globe. This bay is about 30 miles long by 10 miles broad, separating the coast from the Cibao range; it is free from rocks and shoals and has deep water on both the north and south shores. The only shallows are at the west end, where the delta of the Yuna river is gradually extending itself eastward. Strangely enough, Sanchez, the terminal port for the Scotch-owned Samana railway, which runs to La Vega 50 miles westward, is not on deep water. Being in the north-west corner just north of the Yuna delta its harbor is silting up, and ocean steamers have to use lighters to handle their cargoes to and from the pier. By going about three miles farther east, Sanchez could have built its wharves by the deep water of the north shore, but as the railway has the monopoly of all lighterage at the port at 50c. per ton, it is not worrying about what 'might have been.'

Hatillo, the centre of the iron district, lies 20 miles south of Pimentel, the nearest railway point, 30 miles west of Sanchez. Though Hatillo is only 50 miles by the road from Sanchez, by the river it is more than twice as far. From Hatillo down to Doneliguel at the mouth of the Camu, the Yuna river descends for 25 miles in a fairly straight line, with a steep gradient, but below Don Miguel, the Yuna begins to meander in its alluvial plain and flows 90 miles to reach Sanchez, while the bee-line distance is only 30. Since the completion of the Samana railway in 1886, it has absorbed most of the river traffic. By pulling the snags, blasting the rocks, and doing some dredging in the channel, it is probable that the Yuna river could be made navigable for small stern-wheel steamers as far as Isleta, 70 miles from Sanchez.

The Cibao range, which borders the Yuna valley on the south, extends the whole length of the island in long parallel folds of Mesozoic and perhaps Paleozoic sedimentary rocks, cut into many peaks by canyons and ravines, and clothed with dense forests to the very top. Between Santiago and the Haitian border the peaks exceed 9000 ft. above sea-level, and here is the centre of a great post-Cambrian batholith, which extends east from the longitude of Monte Cristi to that of the port of Azua. The batholith forms the core of the range, and the sedimentary rocks in its vicinity are considerably metamorphosed.

The beds of several of the rivers, especially the Jaina and Nigua, draining the higher peaks, carry gold, and many millions of ounces of the precious metal were recovered by the companions of Columbus with a few years after their arrival.(2) These ancient gold-seekers seem to have skimmed off the cream within a few years, for the gravels have yielded but little to the native washers in modern times.(3) The failure of several recent attempts by American companies to revive the placer industry merely has served to demonstrate the unpalatable

truth that the 'guileless' native salters are still superior in practical cunning to many a sophisticated foreign sampler.

The low rounded foot-hills of the Cibao range, which dot the Yuna river bottoms near Hatillo, contain the iron-ore deposits. These hills are formed of limestone and porphyry. The former was originally a soft gray rock, but near the contact it is often crystallized or silicified. The porphyry is softer than the limestone and forms the gulches and lower slopes of the hills. In its exposures it is a decomposed yellow matrix enclosing numerous small 'eyes.' The only two examples of unaltered porphyry I was able to find showed it to be andesite having a grayish green matrix with phenocrysts of white feldspar. The only other rock noted in this vicinity was a hard white quartzite found on the hills and showing inclusions of iron oxides.

I examined the five iron deposits, lettered A to E on the map. These were all I was able to find in the district. Their local names are.

A. Sabana de Hatillo.
B. Arroyo Piedra Iman.
C. Arroyo Margarita.
D. Arroyo Jaquez.
E. Loma del Gallo.

All the deposits present a similar appearance on the surface. They show no solid ore, but merely fragments, from the size of a fist to that of a pumpkin, embedded in the clay-like porphyry along its contact with the limestone. They are covered with soil, and often bear trees of considerable size. The following six samples indicate that the ore, such as has been found, is of unsurpassed quality.

	1	2	3	4	5	6
Iron	67.59	67.25	68.15	67.49	69.02	67.05
MnO	0.33	0.20	0.10	0.30	0.30	0.20

P	0.040	0.059	0.053	0.050	0.035	0.041
Insoluble	1.90	1.80	2.00	1.60	1.70	1.60
CaO	0.80	0.60	0.40	0.60	0.40	0.30
H_2O	0.30	0.80	0.50	0.60	0.60	0.80
Fe_2O_3 (a)	79.11	80.68	81.96	77.82	80.11	93.32
FeO (b)	5.94	14.52	14.27	17.22	17.22	2.44
Fe_2O_3 to form Fe_3O_4 with (b) = (c)	19.26	17.68	17.73	21.08	21.08	2.52
Fe_2O_3 = (a) — (c)	69.85	63.00	64.23	56.74	59.03	91.30
Fe_3O_4 = (b) + (c)	35.20	32.20	32.00	38.30	38.30	4.96
Ratio, hematite to magnetite	1.98	1.95	2.00	1.48	1.54	18.40

Samples No. 1 to 5 were all from deposit A and show close agreement in the ratio of hematite to magnetite, which carries from 1.48 to 2.00. Sample No. 6 was a piece of float found in the road two miles north of A and of unknown origin; it is nearly pure hematite. These analyses are typical of contact ores and resemble those of lenses in Santiago, Cuba, in Carbon county, Utah, and Fierro, New Mexico. The quality being satisfactory it was next in order to determine the quantity of ore available.

In the surface exposure the deposits varied in area. In deposit C the ore lay along a porphyry dike, between limestone walls, but in all the others it lay with its long dimension following the limestone contact on the porphyry side. Measurement showed the following dimensions:

Deposit	Length, ft.	Breadth, ft.	Acres
A	1020	250	6.3
B	400	200	1.8
C	1700	115	4.5
D	380	240	2.1
E	490	240	2.7
Total			17.4

It was decided to prospect deposit A by sinking test pits at regular intervals. In going over the surface to locate sites for these pits, a number of old caved holes were discovered, and inquiry proved them to be the work of a French engineer named Fieux, who had sunk them about 1891, with negative results as to the finding of ore in place. It was therefore no surprise to have the new test-pits invariably 'bottom' in the barren decomposed porphyry after passing through a few feet of the surface blanket of ore fragments and clay. Having only dug 14 pits, the number was perhaps insufficient to affirm the absence of any solid ore in the hill, but the pits certainly demonstrated that deposit A was nothing like the 'mountain of magnetic iron ore' that Gabb had dubbed it. The commercial feasibility of the proposed project for development depended on the existence of at least a million tons of iron in deposit A, while the blanket of fragments contained only a tenth of that quantity. As deposits B and D had both been dug over by M. Fieux in 1891 and had been shown to be similar in type to deposit A, further investigation was useless. The remaining deposits, C and E, are on hills some distance from the proposed Yuna river transportation. If solid ore can be found below any of these detrital deposits, it is probably in deposit C, which occurs in a trench between limestone walls, and may thus have survived the erosion that seems to have destroyed the other ancient lenses, leaving nothing but the debris of their roots as evidence of their former existence.

The theory that these deposits came from lenses *in situ* seems the only tenable one; both because each lies directly along the lime-porphyry contact and the nature of the ore is identical with that of solid contact lenses in other districts. The fact that only five hills out of many similar ones as to height and age in this locality, contain such deposits indicates that the detritus does not represent the remnants of a continuous stream bed or blanket of ore which may be reduced from its original to its present condition by erosion of the Yuma valley.

Should the Samana railway ever be extended as far as Hatillo, it would then be feasible to develop these iron 'placers' for export. Mining could be done by wheeled scrapers or steam shovels, and the chunks of ore could be cleaned from their clayey matrix by log washers. At least 300,000 tons of high-grade ore could be extracted by such operations. To better this quantity there would be a chance of finding other deposits, besides the five now known, and also of discovering one or more lenses of solid ore after the residual masses had once been scraped off their tops.

War Minerals Control

Herewith we give, verbatim, the text of the new bill introduced by Senator Henderson.

A bill to provide further for the national security and defense by encouraging the production, conserving the supply, and controlling the distribution of certain ores, metals, minerals, intermediate metallurgical products, alloys, and chemical compounds thereof, including power to the United States to contract therefor; to requisition and sell the same; to acquire and develop lands and plants producing or capable of producing the same; making appropriations therefor, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That by reason of the existence of a state of war, it is essential to the national security and defense, and to the successful prosecution of the war, and for the support and maintenance of the Army and Navy, to provide for an adequate and increased supply, to facilitate the production, and to provide for an equitable and better distribution of the following-named mineral substances and ores, minerals, intermediate metallurgical products, metals, alloys, and chemical compounds thereof, to wit: Antimony, arsenic, ball clay, bismuth, bromine, cerium, chalk, chromium, cobalt, corundum, emery, fluorspar, ferro-silicon, fullers' earth, graphite, grinding pebbles, iridium, kaolin, magnesite, manganese, mercury, mica, molybdenum, osmium, sodium, platinum, palladium, paper clay, phosphorus, potassium, pyrites, radium, sulphur, thorium, tin, titanium, tungsten, uranium, vanadium, zirconium, and of such other rare or unusual elements as the President may, from time to time, determine to be necessary for the purposes aforesaid, and as to which there is at the time of such determination, a present or prospective inadequacy of supply; to accomplish which purposes this Act is passed. The aforesaid substances mentioned in any such determination are hereinafter referred to as necessaries.

SEC. 2. That the President is authorized from time to time to enter into, to accept, to transfer, and to assign contracts for the production or purchase of necessaries, to provide storage facilities for and store the same, to provide or improve transportation facilities, and to use, distribute, or allocate said necessaries, or to sell the same at reasonable prices: *Provided,* That no such contract of purchase shall cover a period longer than two years after the termination of the war.

The President is further authorized, upon finding that importation into the United States of any of the necessaries covered by this Act is likely to result in a loss to the United States on any necessaries which it may have acquired hereunder, to ascertain, fix, and proclaim such rate of duty upon such imported necessaries as shall be sufficient to adequately protect the United States from any such loss.

The funds provided by section 6 hereof shall be used in carrying out the powers granted by this section, and all moneys received by the United States from or in connection with the disposal of such necessaries, shall be used as a revolving fund for further carrying out the purposes of this Act. Any balance of such moneys remaining when the object of this Act has been accomplished, shall, as collected, received, and on hand and available, be covered into the Treasury as miscellaneous receipts.

SEC. 3. That the President is authorized to requisition and take over any of said necessaries, to provide storage facilities for and to store the same, and to use, distribute, allocate, or sell the same; and also to requisition and take over any undeveloped, insufficiently developed or operated, or idle land or deposit, mine, smelter, or plant, or part thereof, producing or, in his judgment, capable of producing said necessaries, and to develop and operate the same, either through the agencies hereinafter mentioned, or under lease, royalty, agreement, or in any other manner, and to store, use, distribute, allocate, or sell the products thereof. Whenever the President shall determine that the further use or operation by the Government of any such land, deposit, mine, smelter, or plant, or part thereof, so acquired, is no longer essential for the objects aforesaid, the same shall be returned to the person, firm, or corporation entitled thereto. The United States shall make just compensation, determined by the President, for the taking over, use, occupation, or operation by the Government of any such necessaries, or any such land, deposit, mine, smelter, or plant, or part thereof. If the compensation so determined be unsatisfactory to the person, firm, or corporation entitled thereto, such person, firm, or corporation shall be paid seventy-five per centum of the amount so determined and shall be entitled to sue the United States to recover such further sum as added to said seventy-five per centum will make up such amount as will be just compensation, in the manner provided by section twenty-four, paragraph twenty, and section one hundred forty-five, of the Judicial Code.

The President is authorized to require statements and reports, to examine books and papers, and to prescribe such rules and regulations as he may deem appropriate for carrying out the purposes of this section, including the operation of any such land, deposit, mine, smelter or plant, or part thereof, the purchase, use, sale or other disposition of articles or substances used, manufactured, produced, or mined therein, and the employment, control, and compensation of employees. The fund provided by section six hereof may be used in carrying out the purposes of this section, and all moneys received by the United States from or in connection with the use, operation, or disposal of any such necessaries, land, de-

posit, mine, smelter or plant, or part thereof, shall be used as a revolving fund for further carrying out the purposes of this Act. Any balance of such moneys remaining when the objects of this Act have been accomplished, shall, as collected, received, and on hand and available, be covered into the Treasury as miscellaneous receipts.

SEC. 4. That any person who shall neglect or refuse to comply with any order or requisition made by the President pursuant to the provisions of this Act, or who shall obstruct or attempt to obstruct the enforcement of or the compliance with any such requisition or order, or who shall violate any of the provisions hereof, or any rule or regulation adopted hereunder, shall, upon conviction, be fined not exceeding $5000, or be imprisoned for not more than two years, or both.

SEC. 5. That the sum of $500,000 is hereby appropriated, out of any moneys in the Treasury not otherwise appropriated, to be available until June thirtieth, nineteen hundred and nineteen, for the payment of all administrative expenses under this Act, including personal services, traveling and subsistence expenses, the payment of rent, the purchase of equipment, supplies, postage, printing, publications, and such other articles, both in the District of Columbia and elsewhere, as the President may deem essential.

SEC. 6. That the sum of $50,000,000 is hereby appropriated, out of any moneys in the Treasury not otherwise appropriated, which, together with all moneys received from time to time under the provisions of this Act, all of which shall be credited to said appropriation, shall be used as a revolving fund for carrying out the objects of this Act, and for the purpose of making all payments and disbursements, including just compensation under section 3, by this Act authorized: *Provided,* That no part of this appropriation shall be expended for the purposes described in the preceding section: *Provided further,* That a detailed report of all operations under this Act, including all receipts and disbursements, shall be filed with the Secretary of the Senate and Clerk of the House of Representatives on or before the twenty-fifth day of each month, covering the preceding month's operation. Any balance of said revolving fund remaining when the objects of this Act have been accomplished, shall, as collected, received, and on hand and available, be covered into the Treasury as miscellaneous receipts.

SEC. 7. That the President is authorized to exercise each, every, or any power and authority hereby vested in him, and to expend the moneys herein appropriated or provided for, or any part or parts thereof, by and through such officer or officers, department or departments, board or boards, agent, agents or agencies as he shall create or designate, from time to time, for the purpose. He may fix the reasonable compensation for the performance of such services, but no official or employee of the United States shall receive any additional compensation for such services except as now permitted by law.

SEC. 8. That the President is authorized, if in his judgment such action be necessary or useful for the objects of this Act, to form one or more corporations under the laws of any State, Territory, District, or possession of the United States, for the purpose of carrying out the powers or any of the powers hereby authorized. The capital stock of any such corporation shall be such as the President may determine, but the total capital stock for all corporations so formed shall not exceed in the aggregate the appropriation of $50,000,000, made by section six hereof. Said appropriation, or any part thereof, may be used by the President in subscribing on behalf of the United States, through such person or persons as he may designate, to the capital stock of such corporation or corporations, and the capital and assets of any such corporation or corporations, together with all additions thereto under sections two and three hereof, may be used in carrying out the objects of this Act. The directorate and organization of such corporation or corporations shall be such as the President may prescribe, and such corporation or corporations shall have all such charter powers as may be necessary or desirable to enable it or them to accomplish the objects of this Act. The capital stock of any such corporation or corporations shall be held and voted for the exclusive benefit of the United States, through such person or persons as the President may designate.

SEC. 9. That the powers and authority granted by this Act shall cease upon the expiration of two years after the termination of the war, and within said period the President, and any officer, department, board, agent, agency or corporation carrying out the provisions of this Act, shall dispose of any necessaries, land, deposit, mine, smelter or plant, or part thereof, held by him or it hereunder, and shall fulfill the terms of any contract made hereunder, and thereupon any such corporation or corporations shall be dissolved; *Provided,* That the termination of this Act shall not prevent the subsequent collection of any moneys due the United States, nor shall it affect any act done or any right or obligation accrued or accruing, or any suit or proceeding had or commenced before such termination, but all such collections, rights, obligations, suits and proceedings shall continue as if this Act had not terminated, and any offense committed or liability incurred prior thereto shall be prosecuted in the same manner and with the same punishment and effect as if this Act had not terminated.

SEC. 10. That if any section or provision of this Act shall be declared invalid for any reason whatsoever, such invalidity shall not be construed to affect the validity of any other section or provision hereof.

INSUFFICIENT LIGHTING CONDITIONS are held to be responsible for at least 25% of the avoidable accidents to workmen in the United States. From July to December each year there is an increase of accidents per month, the 'peak' occurring in the darkest months of the year. From mid-January to June there is a drop in casualties. Poor lighting in mines and works results in a desire to avoid such places, accidents, and lower efficiency. Much better work is done when there is plenty of light.

SPOKANE, WASHINGTON

Proceedings of the Gold Conference.

The International Gold Conference, convened by the Northwest Mining Association, sat here on September 5 and 6. Discussion of the important features appears on another page of this issue of the 'Press.' G. B. Dennis, president of the Association, made the address of welcome. F. A. Ross was temporary chairman, Judge George Turner permanent chairman, and Sidney Norman was secretary.

A paper entitled 'The Necessity of Maintaining the Gold Reserve,' was read by G. H. Greenwood of the Old National bank of Spokane. He thought that the payment of a bounty was a possibility. Courtenay De Kalb, of the 'Mining and Scientific Press,' said that American bankers were very much interested in the problem. If gold is left in the mines a great power remained inactive. F. A. Ross, in his paper, 'The Gold Situation and Its Remedies,' favored a bounty. M. D. Leehey of Seattle, representing Alaska, also wanted a bonus. F. A. Thomson, of the Idaho School of Mines, considered that a bonus on new gold would stimulate the opening of new ground. The central Idaho gold belt has favorable possibilities. J. N. Pickell of Orogrande, Idaho, thought that the provision of facilities for gold mining was more essential than a bonus. The Government should improve the roads. The present cost of hauling supplies was often greater than their value. Stanly A. Easton, of the Bunker Hill & Sullivan, prepared a paper 'The Relation of Labor to Mining,' but was unable to attend the meeting. W. Fleet Robertson, Provincial Mineralogist of British Columbia, thought that the expectation in the form of a bounty should not be based upon the content of the ore. There were deductions for smelting and loss that should be given consideration. The following table, prepared by Mr. Robertson, shows the source of gold and estimates for 1918 for British Columbia:

Source	1914 oz.	1917 oz.	Estimate, 1918 oz.
Stamp-mill	60,477	40,480	35,000
Smelters:			
Gold-copper ore	138,867	36,314	50,000
Copper-gold ore	44,502	53,890	32,000
Silver-lead ore	3,324	3,760	3,500
Miscellaneous	.....	74	.....
	247,170	114,523	120,500
Placer gold	28,250	24,800	17,500
Total	275,420	139,323	138,000

1917 Percentages of Value in Ores

	Gold, %	Silver, %	Copper, %	Tons,
Stamp-mills	97.30	2.70	....	72,071
Smelters:				
Gold-copper ores	58.45	4.04	37.50	107,712
Copper-gold ores	4.31	2.34	93.35	2,025,124
Dry silver-lead ores	46.62	53.38	....	.....
Miscellaneous	....	....	....	4,078

There was a large attendance at the conference, including the following list, totaling 124 delegates:

Alaska.—Jack Irvine, interior; Maurice D. Leehey, of Seattle and Seward; O. G. Robinson, Yenta district, Cache creek; and E. D. Reiter, Valdez.

British Columbia.—William Fleet Robertson, Provincial mineralogist; J. H. Jackson, Granby; Ernest Levy, Rossland Board of Trade, and manager of Le Roi No. 2; R. F. Green, member of Parliament for West Kootenay; J. J. Warren, at Trail smelter; W. M. Archibald, consulting engineer Consolidated M. & S. Co.; C. E. Bennett; Harry Wright; Charles Caldwell, president Mine Owners Association of the Kootenays; Thomas Butler; P. H. Clark; C. C. Ladd; and R. A. Stewart.

California.—Courtenay De Kalb, representing American Gold Conference of Reno; and George H. Tweedy, representing northern California.

Idaho.—Robert N. Bell, State Mine Inspector; A. J. Devlin; E. H. Lindley, president University of Idaho; Paul Bockmier, Gold Creek district; Francis A. Thomson, School of

PART OF THE NORTH-WEST

Mines, University of Idaho; W. L. Penick, representing War Minerals Committee; E. M. Griffith, Grangeville district; F. D. Leeper, A. W. Boyd, W. C. McNutt, J. M. McLean, and Phil. Hartman, Elk City district; M. A. Sherman, J. E. Pickrell, and J. N. Pickrell, Orogrande district; M. J. Barrett, F. F. Smith, and John Grinde, Ten Mile district; Stephen M. Smith, Boise district; A. M. Wilton, Boise Basin district; Joseph Pelikan, B. L. Schultz, R. Wethered, Edward Rudolph, and G. K. Reed, Buffalo Hump district; G. R. Calvin, Pine Grove district; H. E. Hewitt; R. M. Wank; and R. J. McLin, Dixie district.

Minnesota.—A. R. Amundsen, Loon Lake district, Washington.

Montana.—William Muth, F. S. Earnest, R. A. McCray, Charles Heibronner, and L. S. Ropes, Helena district; T. S. Eckholm and Joseph Garneau, McClellan district; A. W. Patterson, Anaconda district; W. M. Manning and P. B. Bennett, Lewis and Clark county.

Nevada.—Eugene Davis, representing American Gold Conference; and Oscar Gillice.

Oregon.—H. N. Lawrie, representing American Gold Conference; E. D. Whitney, Portland Chamber of Commerce; A. F. Dixon, Susanville; Robert M. Betts, Cornucopia district; H. C. Mahon, president Champion Mines Co.; W. Burnham, Baker county; and George W. DeWitt, of Greenhorn and Susanville.

Washington.—The Governor, Ernest Lister; W. E. Mann; S. A. McCoy, Stevens county; C. G. Warfel, State School of Mines; L. H. Markham, Okanogan district; C. P. Robbins, Richard March, G. S. Bailey, John Byrne, J. W. Turner, and D. M. Drumheller, Jr., Republic district; Martin J. Maloney, Washington district; A. L. Flewelling, C. P. Oudin, P. P. Rooney, F. C. Robertson, C. M. Fassett, J. J. Hennessy, Orient district; Thaddeus S. Lane, president Chamber of Commerce; G. H. Harrington, Boundary district; A. H. Perkins; Albert Ansell; J. H. Lynch; H. H. Shallenberger; E. H. Lindley, president University of Idaho; E. T. Coman, president Exchange National; C. A. Batchelder; M. D. Couch and Will Everett, representing Wallace & Wallace; Lewis P. Larsen, Metaline district; L. Oriand, Chesaw district; Jerome L. Drumheller; J. M. McBride, Myers Creek district; F. O. Bowman; H. J. Ellard; W. H. Agens; J. W. Feighner; E. H. McDonald; Story Buck; J. M. Porter; S. L. Boyer; John H. Eachan; J. E. Leonard; and Forest Fraser, Keller district; L. K. Armstrong; Russell Collins; William Hammer; C. A. Gray; V. P. Adams; C. A. Long; H. F. Herkebrath; W. J. Harris; M. B. Morrow; John Copeman; J. P. Loring; and Robert Ferguson.

PORTLAND, OREGON

Bankers Discuss the Gold Situation.

On September 5, a conference was held here under the auspices of the Oregon Bankers Association, to consider the status of gold production. Bankers from Washington and California were also present. E. G. Crawford presided. John Clausen, vice-president of the Crocker National Bank, San Francisco, was the principal speaker. He briefly covered the work of the American Gold Conference at Reno on August 12, and the condition of gold and credit throughout the world.

The resolutions adopted by the Association are given in full on another page of this issue.

The bankers heartily approved of the appointment by the Secretary of the Interior of a committee to study the increased cost and the decreased output of gold in order that the gold production of the United States may be maintained at its pre-war value, also, that the chairman or secretary of this convention be instructed to present these resolutions to the American Bankers Convention to be held at Chicago, commencing September 23, 1918.

VICTORIA, BRITISH COLUMBIA

Gold Receipts.—Granby Consolidated Closes Phoenix Mines.—Tidewater Copper Mine Re-opened.—Mine-Rescue Meet.—Development in Western Mining District.

Gold bullion deposited at the Dominion Assay Office at Vancouver during August was valued at $608,838. This is an increase of $253,846 over the same month of 1917. Most of this bullion came from the Yukon.

The Boundary district has suffered a blow by the recent closing of the Phoenix mines of the Granby Consolidated, with the consequent cessation of smelting at Grand Forks. This also means a serious loss to the West Kootenay Power & Light Co., which for years has supplied power for the reduction works, and to the small mine operators who made ore shipments to the smelter. Many employees will be thrown out of work. The company states that it is no longer profitable to treat the low-grade ore of the Phoenix mines. The increases in the cost of hydro-electric power, coke, and freight-rates were largely responsible. These mines have been operated for some time on a narrow margin, it costing 22½c. per pound to produce copper from the Phoenix ores. With the fixed price of 23½c. there was a profit of 1c., but the subsequent increase to 26c. did not make the difference that might have been expected, owing to the rise in freight-rates at the same time. Operation of the Phoenix mines began in 1910, when, under the management of the Granby company, it produced 169,087 tons of ore. In that year the first furnace of 300-ton capacity was completed and produced 8871 oz. of gold, 34,990 oz. of silver, and 5,435,955 lb. of copper. Additions to the plant were made until its daily capacity reached 4500 tons. The converter plant was started at Grand Forks in 1902, and its capacity increased in 1909. The mines are estimated to have produced up to the end of the last financial year, ore valued at $55,550,000, or nearly 10% of the total mineral production of the Province up to June 30, 1917. Hope has not been abandoned of persuading the Granby company to continue operations in this district, and J. E. Thompson, member of the local legislature for Grand Forks, states that the company's plans must not be accepted as contemplating abandonment of the property even temporarily. He asserts it is most probable that after some repairs to plant the industry will be re-established,

The Tidewater Copper Co., Sidney inlet, Vancouver Island, according to W. G. Tanner, vice-president, is carrying on extensive development. At present, old workings are being re-opened. To facilitate transportation a tunnel is being driven through the mountain, while a tramway is under construction connecting with the bunkers and wharf. A shipment valued at $20,000 was made recently to the Tacoma smelter. The Tidewater is an old and well-known mine, having been operated first by the late Lieutenant-Governor Dwedney and associates. It shipped 10,000 tons of 4% ore, and did development to the point of uncovering a considerable body of good ore. At that time the price of copper was not high enough to make work profitable and the mine was closed. Present prices resulted in its being re-opened.

The coal-miners of Nanaimo, Ladysmith, Extension, Wellington, and Comox were well represented at the annual meeting of the Vancouver Island Mine Safety Association, held at Cumberland on September 2. The mine-rescue and first-aid competitions were of high standard and were keenly contested.

The resident mining engineer for the western district of British Columbia, W. M. Brewer, is enthusiastic regarding present conditions in that region. In over 20 years he has never seen prospects more encouraging. The Phelps Dodge (Arizona) interests have taken bonds on the Fraser claims (East Sooke); the Ladysmith Smelting Corporation has bonded the Willow Grouse, Cowichan lake; the Ralph properties are under charge of Mr. Aldrich of New York, ex-manager of the Trail smelter; and the Sunlock mines, Jordan river, are being run by Patrick Stewart for a Vancouver company. In the Alberni Canal region Samuel Ryder, of St. Albans, England, has erected new bunkers and a compressor-plant at the old Monitor mine, which was sold three years ago for taxes. It is reported that a large orebody has been developed. At Quatsino sound, also Vancouver Island, the Coast Copper Co. is working the Old Sport group on Elk lake, and plans are said to be under way for a 16-mile railroad from the mines to the coast. At Sidney inlet, the Tidewater Copper Co. of New York is working the Indian Chief group, a former Dwedney holding; and at Knights inlet the Princess and Union groups are being operated. Work is proceeding on the Texada Island properties and prospecting forces are working everywhere, particularly on Jervis inlet.

THE MINING SUMMARY

ALASKA

Anchorage.—William Martin, operating the Gold Cord mine in the Willow Creek district under a short-term lease, reports that the first mill test of 40 tons of ore yielded $70.46 per ton. Tailing assayed $12 per ton, which was reduced to 80 cents in the cyanide plant. The mill has a capacity of 35 tons per day, and will continue to operate until November 1.

A Straub stamp-mill (circular type) is being erected at the Miller-Bartholf prospect.

Owners of the Mabel mine are reported to have found the vein which was lost by faulting.

There has been considerable prospecting for chromite on

PROSPECTING FOR QUARTZ VEINS AT FAIRBANKS, ALASKA

the lower Kenai peninsula during the summer, but no new discoveries are reported.——A. C. Gill, of the University of California, has been studying the chromite deposits for the U. S. Geological Survey.——Whitney & Lass, mining chromite at Port Chatham, have been shipping regularly, between 400 and 500 tons being mined from a deposit between high and low tides. Operations are under way to mine ore on the mainland. A mill, consisting of 10 stamps and a Frue vanner, is being erected, together with a tram and wharf.

Californian interests have had an examination made of gold-quartz prospects at Nuka bay.

C. H. Packard is prospecting a graphite deposit at Red Bluff, on Seldovia bay.

Employees of the Alaskan Engineering Commission have rejected an increase of 10% in wages offered by the Commission. With a committee from the Anchorage Chamber of Commerce they have taken up the matter with the Secretary of the Interior at Washington.

The U. S. Geological Survey has opened an office at Anchorage. Theodore Chapin is in charge.

Port Chatham.—Prospecting for chrome at Red mountain, on Kenai peninsula, and seven miles from the Pacific tidewater, has disclosed 50,000 tons of high-grade ore. W. P. Lass, formerly at the Alaska Treadwell at Juneau, is part-owner and manager of this venture.

ARIZONA

Bisbee.—A carload of copper ore is being shipped daily from the Higgins lease. This ore carries 700 lb. (35%) copper per ton.

Canon.—The Kay Copper Co., operating at this place, 25 miles south of Mayer, in charge of G. W. Long of Oatman, reports encouraging results. The old 500-ft. shaft was repaired when the new owners recently took over the mine from S. J. Tribolet of Phoenix. A south drift at this depth cut an orebody 12 ft. wide. The 5-ft. face assayed 18.4% copper, 1.35 oz. silver, and $1.40 gold; and the 7 ft. of drillings somewhat higher. The full width has not yet been determined.

Globe.—East of the McGaw fault, on the No. 9 and 10 levels, the Superior & Boston has opened 15% copper ore. On the level above this shoot has been driven 70 ft., with 19 ft. of ore in the face.

Hackberry.—The main shaft on the Hackberry mine has reached a depth of 800 ft. The vein has been cross-cut at the 700-ft. level and 100 ft. of driving done. The ore on this level is said to be as good as on the upper levels. Construction of the mill is progressing rapidly.

Kingman.—The Rico Exploration Co., operating north of here in the Wallapai district, cut the vein at a depth of 140 ft. It was 4½ ft. wide, 2½ ft. of which assayed $91.65 per ton in gold and silver; the remainder $20 per ton. A 5-in. streak is said to assay 800 oz. silver per ton. The shaft is to be continued to 200 ft. W. W. Lewis is manager.

The Cactus Queen Mining Co., in the Owen district, has purchased $30,000 worth of machinery. As soon as erected the shaft is to be sunk to the 500-ft. level. Development on the 150-ft. level has exposed 6% ore, carrying gold and silver.

The trial run at the George Washington mill, at Mineral Park, was a complete success. The plant is now in continuous operation, making an extraction of 92%.

The Copper World mine, 14 miles east of Yucca, has been taken under option by Charles Adams and associates. The mine will be unwatered and developed. This property is owned by the Commercial Mining Co., a subsidiary of the Phelps Dodge Corporation.

The first dividend, amounting to $20,000, has been declared by the Yucca Tungsten Company.

Mayer.—At the fork of Ash creek and Agua Fria river, 12 miles south-east of here, Bunker & Burmeister have two manganese mines. One of them is leased to B. Sherwin of Mayer. A contract has been arranged with the Western Ore Purchasing Co. of Reno, Nevada, for 15 tons daily from the two mines.

In the Copper Mountain district, the Big Bug Copper Co. is moving a gasoline hoist from a property that it owns north of the Blue Bell mine, to the shaft being sunk on the north-east side of Copper mountain. At a depth of 70 ft., shipping-ore fills the shaft-bottom.

Something good is sure to come from the work being done on nearly all of the new properties in this district. W. A.

Tucker, who represents a large interest in the Barbara mine, came from Bisbee last week to consult with the owners at Mayer, on a proposed sale of the property.

The Christmas group, owned by the Jerome Copper Co., has been bonded to New Yorkers, and shipments of surface ore have been arranged for the Humboldt smelter.——The adjoining property, the Hall, it is understood, is tied up in a deal with prominent Western men.

St. Louis people have organized the Liberty Copper Co. on the Jeane claims, which are west of the A. B. C. mine, and it is stated that extensive development is to begin soon.

Dr. Vivian, William Belford, and others, owners of the Little Egypt, have organized a company.

The Western Copper Co., recently organized, has taken over large holdings south of the Half Moon, and the old Patton mine, which adjoins the Copper Queen on the south. A new shaft has found high-grade copper ore of considerable promise.——The Patton mine also carries the south extension of the ore zone of the Copper Queen and A. B. C. mines. The president of the company is W. W. Lawson, of Phoenix, and the general manager is W. D. Mahoney, of Jerome.

Stoddard.—The Arizona Binghampton's flotation plant has been working for two years. The recovery has been consistently high. The present tonnage is 180 per day.

Superior.—Magma Copper pays 50 cents per share on September 30. This is equal to $120,000.

St. Thomas.—The Grand Gulch copper mine continues to yield rich ore, which is sent to smelters in Utah.

ARKANSAS

Yellville.—According to A. N. Stanfield, mining near Rush, the committee that allocates the zinc concentrate which is fixed at $75 per ton, does not give the smaller producers a fair chance. He has protested to the War Industries Board to that effect.

CALIFORNIA

Angels.—The Utica mine has been closed and the plant will be sold. The superintendent, F. J. Martin, goes to his ranch in Arizona.——The Gold Cliff mine adjoining will be worked in charge of A. C. Wilson. A bulkhead on the 1500-ft. level of the Utica will prevent water from flooding the Gold Cliff.

Cloverdale.—The Esperanza quicksilver mine has been shut-down. The ore yielded under 0.5% mercury, and the furnace was inefficient.

Crescent Mills.—Machinery is being dismantled and work at the local gold mine stopped. Reasons for this are unknown at present.

Engelmine.—An amusement hall, including dance-floor, billiard and pool-rooms, and barber-shop, are to be the first of several large buildings erected at the Lower Camp. An office building, commissary, and hotel are also being planned. An addition is being made to the 'Superior' plant for the installation of a new Hardinge mill. Mine timbers and buildings consume the entire output of the company's sawmill, which has a daily capacity of 18,000 board feet.

The Trask Copper Mining Co., on this belt, two miles from Engelmine, has started work on a 20-ton flotation mill. Development at the mine has been discontinued until the mill is completed. With ore carrying 3 to 4% copper, 12 oz. silver, and $2 gold, the owners expect that their concentrate will more than pay for development.

Development of the Snowstorm claim is under the management of H. E. Bush. Indications are encouraging. Mr. Bush is well known from his work at the Engels mine.

A. L. Beardsley is directing development operations at the Tri-Metallic mine, which joins the west line of the Engels mine.

Genesee.—Plans are being prepared for erection of a concentrating plant at the Beardsley mine, north of Genesee. The property is owned by M. J. Smith and A. L. Beardsley. Three large copper-silver orebodies have been opened by tunnels and core-drilling. This is one of the most interesting developments in the district.

Happy Camp.—It is reported here that the Mason Valley Mines Co. of Nevada might erect a concentrating plant at its Gray Eagle copper mine, in Siskiyou county. This district is producing some chrome, which is hauled to rail at Hornbrook.

Porterville.—Mining in this district is quiet at present. The Porterville Magnesite Co. is operating. The Tulare Mining Co. is the only one whose work has been anything near normal, as its magnesite goes no farther east than the Mississippi, hence it is not affected by the freight situation. It is rumored the American Magnesite Co., whose calcining plant at Porterville has been shut-down for some time, is to resume soon.

The San Joaquin Portland Cement Co. has been incorporated with a captial of $750,000. A property of 160 acres, 8 miles east of Porterville, has been purchased. It contains a large deposit of limestone and clay, to be used in the 1000-bbl. cement plant to be erected. Potash will be recovered from the dust by the Cottrell system. J. T. Humburg of San Francisco heads the company. W. J. Gingee will supervise construction of the plant.

Quincy.—Shipments of ore from the McCarthy-Eddlebottle chrome mines, on the middle fork of the Feather river, back of Claremont range, have already begun. Forty mules have been brought here to carry the ore a distance of three miles. It is then hauled in wagons to the railroad at Quincy Junction. The ore is being shipped by the Union Chrome Co., which has given the contract for hauling to William Patrick at $3 per ton. The ore assays 46% Cr_2O_3, with only a small amount of silica.

The old Bushman mine, at Newton Flat, four miles north of Quincy, is about to be started again. The old shaft is being cleaned out, and preparations made to open new gravel channels. This mine has been a big gold producer in the past, and much faith is being placed in the unworked gravel. The mine is owned by C. D. Hazzard of Quincy, but will be worked at present by Kelsey & Wilson.

Keswick.—The Scottish Chief mine, three miles from this place, is to have a 30-ton mill, the type yet to be decided. M. A. Maher is superintendent. The mine is opening pretty well, after development carried on for the last three years.

Yreka.—The Eastern Mining Co., which is mining chrome near Gottville, has discovered a deposit at Dannemore, in the Siskiyou mountains, near the Oregon line. The ore has to be taken to rail at Hornbrook, a long haul. The chrome content is 42%, with a little manganese.

COLORADO

Cripple Creek.—Gold output of the district in August totaled $849,612 from 78,900 tons of ore. This is $63,000 less than in July.

Dividends paid during the month were $122,000 by the Cresson and $45,000 by the Portland.

Leadville.—M. L. Buchanan and others, who comprise a combination of manganese producers, have secured a lease on the A. V. shaft in California gulch. After repairing the shaft and doing some work on the 400-ft. level, 35% ore was opened.

The Greenback mine in Graham park is being equipped and prepared for a larger output, in charge of H. C. Watson. Ore shipments are being made to the Western Chemical Co. of Denver.

Lessees at the Chrysolite mine on Fryer hill have opened 5 oz. silver and 46% iron ore.

The Anderson tunnel on Prospect mountain is being extended 750 ft., making it 2300 ft. long.

IDAHO

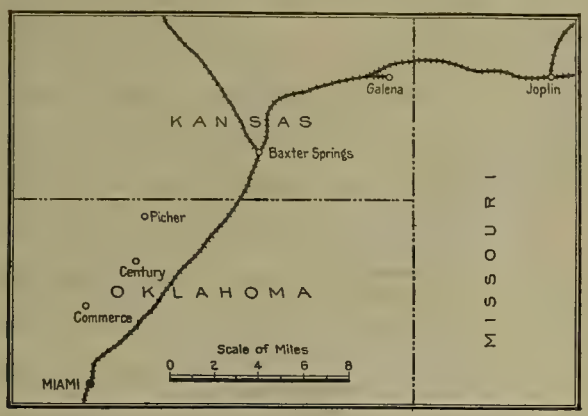
Arco.—The Wilbert Mining Co.'s 100-ton mill was destroyed by fire on August 31. The boiler-house, assay-office, water-tanks, and part of the ore-bins were burned. The plant was insured for $42,000. Incendiarism is suspected.

Mullan.—The National copper mine is opening satisfactorily. At 1400 ft. depth the ore-shoot is 125 ft. long, while on the 1200, 1000, 900, and 800-ft. levels good ore is being mined. A new hoist and electric pump are being put in. The 500-ton mill is working a third of full time.

KANSAS

Baxter Springs.—There are 20 concentrating mills in the Baxter district, 12 of which are producing zinc concentrate. The output two weeks ago was 714 tons.

The Chanute Spelter Co. (American Metal Co.) is completing a 700-ton mill near here. Two large Pomona pumps are discharging a big quantity of water from the mine.



MAP SHOWING RELATION OF KANSAS DISTRICT TO MISSOURI AND OKLAHOMA FIELDS

MICHIGAN

Houghton.—Dividends declared by Michigan copper companies are as under:

Company	Amount per share	Date	Total for 1918
Ahmeek	$2.00	Sept. 27	$8.00
Allouez	1.50	" 25	6.00
Calumet & Hecla	15.00	" 20	40.00
Copper Range	1.50	" 14	4.50
Isle Royale	0.50	" 27	0.50
Osceola	2.00	" 27	8.00
Quincy	2.00	" 30	6.50
Wolverine	1.00	Oct. 1	4.00

MISSOURI

Aurora.—Miners of silicate (calamine) ore are more active than before, due to the better market for their product. The output last week was 202 tons, worth $32 per ton.

Joplin.—Production of the region last week was 7593 tons of blende, 844 tons of calamine, and 1042 tons of lead. Zinc concentrate dropped $2.50 per ton to $52.50; calamine was firm at $35 to $40; and lead was steady at $100. The total value was $500,535, of which Missouri contributed $181,976.

Oronogo.—The Oronogo Mutual mine has been sold by the Waring family to C. T. Orr. Guy H. Waring has been in charge since 1914, but is joining the Government service. C. A. Rice takes his place as superintendent. The new owner is head of the Athletic Mining & Smelting Co., with mines near Joplin and Picher, and a smelter at Fort Smith, Arkansas. The Mutual is well equipped and profitable.

NEVADA

Blair.—The old 17-mile railway from Blair junction to the Pittsburg Silver Peak mine, now closed, is being torn up and sent to Europe.

Goldfield.—Six faces in the Red Hill Florence mine show ore worth from $7.20 to $67.45 per ton, across 18 to 36 in. Awaiting shipment is 165 tons of $35 ore and 500 tons of $6 ore.

The local School of Mines re-opened on September 3, in charge of C. E. Hofmann.

Manhattan.—The White Caps mill is treating 110 tons of ore daily. The shaft is being sunk 125 ft. There is little of importance to record underground.

On the 300-ft. level of the Manhattan Consolidated two good shoots are being opened.

The 700-ft. level of the Union Amalgamated shows 8 ft. of milling ore. W. G. Merton is now in charge.

Some placer mining is still going on in Manhattan gulch.

Pioneer.—The Reorganized Pioneer Mines Co., whose mine and mill were closed in December 1916, is starting important development. The main shaft, 415 ft. deep, is to be sunk to water-level, about 800 ft. depth. Drift No. 3 is being extended to get under good ore that was opened some years ago.

Rochester.—No. 10 level of the Rochester Mines Co. is said still to be opening well. No. 11 is also developing well. The average daily output in August was 181 tons of $13 ore.

On September 2 the Nevada Packard paid a dividend of 2½c. per share. This amounts to $29,115.

OKLAHOMA

Picher.—Production of the districts last week was 4059 tons of blende and 747 tons of lead, valued at $275,119.

UTAH

Bingham.—Upper Main street was burned on September 3, the damage being considerable.

Lark.—The Ohio Copper Co.'s July output was 454,697 lb., almost up to the average of the two previous months.

Tintic.—This district produced 35,000 tons of ore during August, an increase of about 5000 tons, when compared with July. The leading mines in order were the Dragon, Chief Con., Eagle & Blue Bell, Iron Blossom, Tintic Standard, Centennial Eureka, Grand Central, Colorado Con., Mammoth, Gemini, Gold Chain, and Ridge & Valley.

Sixty men are employed by lessees in the Iron Blossom. The company is mining on the 900, 1000, 1100, and 1200-ft. levels of No. 3 workings.

The Colorado Consolidated has $7000 on hand. Royalty from lessees is the principal source of revenue. A large Ingersoll-Rand compressor is to be added to the present plant, which supplies air for all of the Knight properties.

WASHINGTON

Northport.—The Electric Point company distributed $23,790, equal to 3c. per share, on August 31. The daily output of lead ore is now 50 tons. The aerial tram is expected to be finished in September.

CANADA

Bonnington Falls.—The West Kootenay Power & Light Co., a subsidiary of the Consolidated Mining & Smelting Co., having a power-plant here, is making good progress in constructing power-lines to the Canada Copper Corporation's works near Princeton and the smelter at Northport, Washington. From Greenwood, where the Canada Copper smelter is, to Copper Mountain, the situation of the mine, is 100 miles. The transmission-line will carry 100,000 volts. The Northport line will transmit 60,000 volts.

Britannia.—The report of the Howe Sound Co. for 1917, which has copper mines and plant at Britannia Beach, Howe Sound, also lead-silver mines in the Santa Eulalia district, Chihuahua, Mexico, includes the following data:

Smelter returns from copper, lead, silver, and zinc, and

sundries, amounted to $7,114,433. Operations cost $4,574,306, leaving a profit of $2,540,128. Current assets are $2,036,240, and liabilities $457,451. The total development footage in the four British Columbia mines was 32,044. Ore-reserves are estimated at 7,426,080 tons, averaging 1.98% copper. To prospect the Goldsmith claims, an 8 by 10-ft. tunnel was started and driven 399 ft. The 9 by 13-ft. tunnel, known as the 2700-ft. level, was advanced 2172 ft., making it 3603 ft. at the end of 1917. The 3100-ft. tunnel was not extended beyond the 635-ft. point, but an 8 by 8-ft. drift was put in east 367 ft. This is for the raise between the 4100 and 2700-ft. levels, to reduce haulage charges. The 4100-ft. tunnel, the portal of which is 250 ft. east of the new mill at Beach, was advanced 807 ft., making it 2485 ft. long. Four storage-battery locomotives were added to the four already in satisfactory operation. Two more water-driven compressors were installed. A trolley locomotive was obtained for haulage on the tunnel-to-incline system.

At the Mexican properties 4401 ft. of work was done. General underground conditions are excellent, but the general situation was not satisfactory. There was shipped 70,553 tons of lead carbonate, lead sulphide, and iron sulphide ores, carrying from 18.83 to 53.41 oz. silver and 7.18 to 10.20% lead.

At Britannia Beach 671,990 tons of ore was dressed. Shipments to smelter—57,217 tons—averaged 14.29% copper, 0.0173 oz. gold, 1.6 oz. silver, and 3.13% zinc; and contained 16,357,329 lb. copper, 992 oz. gold, and 91,504 oz. silver.

The Utopia and Park Lane dams were strengthened and completed. A tunnel was driven to tap Mountain lake, a natural reservoir. The South Valley power scheme was completed, and is now driving most of the Beach power-house. At this plant there was erected a 2500-kva. generator and two 48-in. Pelton wheels, also two similar wheels as an auxiliary on a 2500-kva. generator already at work. The South Valley project cost $508,644 to the end of 1917.

Kaslo.—Assays have been received from the Mines Branch at Ottawa on several samples of manganese ore sent from Kaslo. No. 1 contains 51.45% Mn, 6.17% Fe, and 7.32% SiO_2; No. 2—52.42% Mn, 5.22% Fe, and 7.30% SiO_2; and No. 3—59.97% Mn, 0.88% Fe, and 2.30% SiO_2.

Surf Inlet.—On the 430-ft. level of the Belmont Surf Inlet mine, on Princess Royal island, the vein is 30 ft. wide in the north drift, of good grade. Development generally is satisfactory.

Trail.—The Consolidated Mining & Smelting Co. pays a quarterly dividend of 2½% on October 1. This is equal to $261,936.

Vancouver.—At the Dominion Assay Office here a refinery is practically complete for gold and platinum; $105 per ounce is to be paid for the latter metal.

Ontario

Cobalt.—The McKinley-Darragh-Savage pays a dividend of 3% on October 1. This is equal to $67,431, making $269,724 for 1918, and $5,349,607 to date.

The Mining Corporation of Canada pays 18¾ cents per share on September 16, equal to $311,259. The total paid by this company and those that it absorbed is $5,594,838.

Gowganda.—Mine operators here express dissatisfaction over the slow progress and poor work being done by the Government on the road to this district.

MEXICO

Chihuahua

Chihuahua.—A number of manganese claims have been staked near this city, and some shipments have been sent to the United States by way of El Paso.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

A. N. Mackay, of Colombia, is in Surrey, England.

Charles Fitch, of Yerington, Nevada, is here on a visit.

Eugene P. Kennedy is on his way to the Kenai peninsula, Alaska.

Richard A. Snell has moved from San Francisco to McGill, Nevada.

John H. Tate, of Jerome, Arizona, was in San Francisco last week.

M. J. Frumken, of Salt Lake City, was in San Francisco this week.

Andrew C. Lawson has returned from Bingham to Berkeley.

J. Morgan Clements sailed from San Francisco for Japan on September 7.

Walter Harvey Weed has been examining a lead-zinc property in Quebec.

H. H. Phelps, of Joplin, Missouri, is at the Whitcomb hotel, San Francisco.

Robert N. Bell, State Inspector of Mines, has been studying mine ventilation at Butte.

G. M. Swindell, of the Los Angeles Chamber of Mines and Oil, was at the Palace hotel last week.

H. C. Bellinger, general manager for the Chile Exploration Co. (at Chuquicamata) is at New York.

L. F. S. Holland has returned from Colorado to Los Angeles. He expects to go to Mexico shortly.

R. G. Hall, new manager of the Burma Mines, sailed for Rangoon from San Francisco on September 14.

N. H. Emmons 2nd is Operations Director of the Government's nitrate plant at Muscle Shoals, Alabama.

Ralph Stokes, now Lieutenant-Colonel in the Royal Engineers, is with the Kola Peninsula Expedition, in northern Russia.

Eugene L. Steindler has moved his office as general manager for the Dominion Reduction Co., from Cobalt, Ontario, to 42 Broadway, New York.

Arthur Feust, consulting engineer to the Peregrina and other subsidiary enterprises of the Guanajuato Development Co. in Mexico, has returned to New York.

Oscar Lachmund has resigned his position as general manager for the Canada Copper Corporation at Princeton, B. C. He is succeeded by **H. R. Van Wagenen** of Denver.

J. G. Souther, superintendent of the Estabrook Gold Dredging Co., has resigned to join the Engineer Corps of the Army. He is succeeded by **J. M. Miles** of San Francisco.

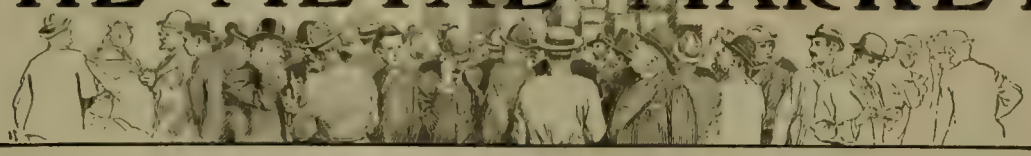
John D. Ryan has resigned as president of the Anaconda Copper Mining Co., to devote all his time to the direction of the Air Service. He is succeeded by the vice-president, **C. F. Kelley.**

N. Bruce MacKelvie died at Sands Point, Long Island, N. Y., on August 17, at the early age of 39. He was president of the Butte & Superior Mining Co., and was identified with the mining activities of Hayden, Stone & Company.

The fourth National Exposition of Chemical Industries opens at the Grand Central Palace, New York, on September 23.

An Oklahoma-Kansas-Missouri Zinc Institute is to be organized, to become a branch of the American Zinc Institute. Victor Rakowsky is chairman. The nominating committee consists of P. B. Butler and F. C. Wallower of Joplin, and R. J. Tuthill of Maine.

THE METAL MARKET



METAL PRICES

San Francisco, September 10

Aluminum-dust, large and small lots, cents per lb	65—70
Antimony (wholesale), cents per pound	16
Copper, electrolytic, cents per pound, in carload lots	26.00
Copper, electrolytic, cents per pound, in small quantities	27.35
Lead, pig, cents per pound	8.30—9.30
Platinum, Government price, per ounce	$105
Quicksilver, per flask of 75 lb	$120
Spelter, cents per pound	12
Zinc-dust, cents per pound	17½

ORE PRICES

September 10

Antimony, 45% metal, f.o.b. California, per unit	$1.10
Chrome, 38 to 48%, California, per unit	$1.25—$1.50
Fluorspar, 85% CaF_2, f.o.b. shipping point, or San Francisco, per ton	$22—$30
Magnesite, crude, California, per ton (nominal price)	$7.00—8.00
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 45%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 85% MoS_2	$1.00
Pyrite, per unit of sulphur, cents	28—32
Tungsten, 60% WO_3, California, per unit	$20—$25

EASTERN METAL MARKET

(By wire from New York)

September 10.—Copper is quiet. Lead is unchanged and under strict control. Spelter is inactive, though firm.

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government has fixed its maximum at 48.81 pence for metal 925 fine.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.35c., respectively, until August 15. On August 7 the current rates were again fixed until November 1, prices to be effective on the day of shipment, not the day of sale.

Copper-refining charges, including freight, are now up to $35 per ton of metal. The average cost in normal times was $12. Some refiners claim that it costs them $27. A ton of copper is worth $520, so that the refining charge is nearly 7%.

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. This is to be continued until January 1, 1919, the price at point of delivery to be at East St. Louis plus freight. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefor $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds.

Tin, tin-plate, and terne-plate regulations have been issued by the War Trade Board. They cover the export of these products.

Tin exports from Hongkong to Pacific ports during the first half of 1918 totaled 7491 tons, against 4556 tons in 1917, and 2641 tons in 1916.

The Vulcan Detinning Co., which recovers tin from scrap, reports sales amounting to $429,161 for the second quarter of 1918. The net profit was $45,999. The previous period's figures were $288,996 and $49,245, respectively.

ORES (New York)

Antimony: There have been no developments and no market in this district.

Ferro-manganese: There has been a slight change in the quotation for 70% alloy. Sales are now being made for delivery this and next month at $250, delivered, for 70% alloy, plus or minus $3.50 per unit above or below this standard, instead of $4 formerly. This has been brought about by the frequent offerings of one producer in recent weeks; but the new basis is really also nearer the true value of the manganese content on the $250 for 70% alloy basis.

Molybdenum: The market is quiet and nominal at $1 per pound.

Tungsten: There is little to be said beyond that reported in previous letters. The market is moderately active, with high-grade ore selling at $24 to $25.50 per unit, and the lower grades selling down to $20. Ferro-tungsten is quiet at $2.35 to $2.45 per pound.

Eastern Metal Market

New York, September 4.

The markets all continued to be quiet but firm, with a strong tone. Price changes, where unregulated, are small.

Enough copper to meet all demands is the chief concern of this market.

Tin continues to decline slowly, but the market is lifeless.

Lead is as scarce as ever, with no prospect of any relief. Prices continue regulated by agreement.

Zinc is less active and is slightly easier as a consequence; but the tone is firm.

Antimony is a little lower on lighter demand.

The August pig-iron output was less than that of July, as expected, due to the heat and humidity. The rate of output was less than that of April, May, and June, but was higher than any other month since May 1917. The total was 3,389,585 tons, or 109,341 tons per day, against 3,420,988 tons in July or 110,354 tons per day, a falling-off of 100 tons in the daily rate. There were nine more furnaces in blast on September 1 than on August 1, and the output should be higher from now on with improved weather conditions. At a meeting of iron and steel-makers in New York on August 28 the labor problem was the sole topic. Not even the question of prices for the last quarter was touched upon. The conference on prices with the War Industries Board will be held on September 18 at Washington. The establishing of a rail price will be left open until that meeting. The Board has ordered an inventory of the country's stocks of finished iron and steel.

COPPER

The labor situation is not what it should be, when full capacity of copper, especially crude copper, is considered. It is causing some concern, particularly to producers, that this is not as large as it should be at Western smelters; the cause is evidently lack of labor. With demand and consumption on the increase almost daily, the need of all the raw metal possible is self-evident. Refinery output is much more auspicious, the monthly average so far this year being estimated at 200,000,000 lb., compared with 205,000,000 lb. per month in 1917. The supply for domestic consumption, however, is aided or supplemented by the fact that exports in 1918 have been much less than in 1917 by almost 30%. The suggestion that the railroads of the United States be electrified at some time in the near future means the consumption of an enormous amount of copper, as does also the development of the water-power of the country. It is interesting to note that the Imperial Munitions Board of Canada reports that so far, 10,000 tons of copper, valued at $5,000,000 has been re-melted and cast with ingots from turnings left in making copper lining-bands for shells for the British Ministry of Munitions. There has been less contracting lately for delivery while the present 26c. price rules, or until November 1. Buying for delivery beyond that date, while small, is at the prices ruling in that period. Jobbing lots, less than 5 tons, are selling at 27.35c. per pound.

It is stated that the increasing demand for copper for war purposes is growing beyond the scope expected by producers and consumers three months ago. It is estimated now that less than 3% of the current output of the country's refineries is going into manufacturing, not in connection with the War. Only a few weeks ago men concerned with the distribution of the metal calculated that 5% was available for commercial purposes in the United States and abroad.

TIN

The only event of the past week has been talk, and only talk, of price-fixing by the Government. An investigation shows no ground for this. Importers would have been notified first, were it a fact; but any regulation would have to be co-operative between the United States and the British governments. A price of 76.50c. per lb. was rumored, but whether with New York as a basis or the Far East was not divulged. The general situation is as quiet as ever, with no sales at all for any position reported. Prices are gradually falling on shipments from the East, and even the nominal spot price is also lower. This is now 83c. per lb., New York, against 88c. a week ago. with the supply still small. For shipments from the Far East probably 76.25c. could be done. Underlying conditions are fundamentally unchanged, buyers remaining uninterested pending results of the important London conferences of American and British tin interests, concerning which no news has yet been made public. Arrivals for August, to the 24th inclusive, were 3535 tons, and those at Atlantic ports 2500 tons to the 29th, inclusive. Spot Straits in London was again lower at £353 10s. per ton yesterday, compared with £367 10s. per ton a week ago.

LEAD

There is very little to be said beyond what has been during the last few weeks. Scarcity of the metal is the pronounced feature, and there is little prospect of this being relieved for some time. In fact, in the opinion of one dealer this may get worse before it improves. The market in the meantime is drifting here and there, with prices at a fixed level as agreed upon by leading producers, namely, 7.75c., St. Louis, or 8.50c., New York, for carload and larger lots and 8.55c., New York, for less. The lead situation is closely analagous to that of copper—producers' committees closely regulating sales and distribution, the main difference being that in the case of lead the committee is voluntary and not a Government body at all.

ZINC

The market is slightly easier than last week on lighter demand and fewer transactions. It is at present on nearly a nominal basis, interest having died out after the fairly large buying of the last 10 days or two weeks. Sellers are apparently well sold up for September and into October, for which the quotation now is nominal at 9.12½ to 9.25c., St. Louis, or 9.37½ to 9.50c., New York. For the fourth quarter the market seems fairly firm at 9c., St. Louis, or 9.25c., New York. For spot delivery it is hardly likely that any better than 9.25c., St. Louis, could be done. A sale for fourth quarter at 8.85c., St. Louis, has been heard of, but it was regarded as second-class metal and not representative of the market. The output of grade A for the week ended August 24 showed an increase, according to the Government's weekly report, but lower grades showed in the main a decrease. Exports of zinc as slabs, spelter, etc., were 4610 tons in July, with the total to August 1 at 51,085 tons. Sheet-zinc is controlled by a maximum price of 15c. per lb., base, with plate-zinc at 14 cents.

ANTIMONY

There has been a light demand, especially for wholesale lots, and the market has fallen slightly. It is now quoted at 14.12½ to 14.25c. per lb., duty paid, New York, for prompt and early delivery.

ALUMINUM

Government fixed maximum prices are unchanged at 33c. per lb. for 50-ton lots, 33.10c. for 15 to 50-ton lots, 33.20c. for 1 to 15-ton lots for both scrap and No. 1 virgin metal, 98 to 99% pure.

THE NEWPORT MINING COMPANY
MINAHALE
OFFICE OF PURCHASING AGENT

July 23, 1918.

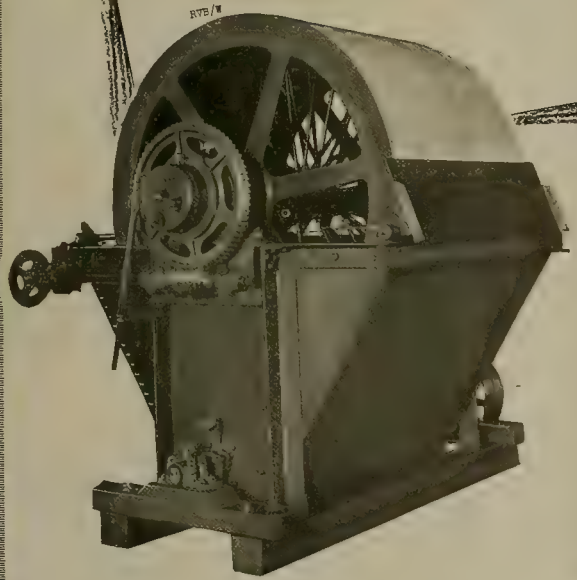
Oliver Continuous Filter Company,
503 Market Street,
San Francisco, California.

Gentlemen:

We have your letter of July 15th. The present extention to our Carrollville plant is being built on a contract between the United States Government and The Newport Mining Company, the Newport Mining Company being the principal owner of the plants of the Newport Hydro Carbon Company and the Newport Chemical Works, Incorporated. The filters are to be installed in Phenol Plant now being erected at Carrollville. The shipment came through in very good time, and, though point of origin is perhaps further away from us than any other item we have had to get for the plant, there is no other one item of equipment with which we encountered any less difficulty in shipment and delivery.

Yours very truly,
THE NEWPORT MINING COMPANY,
By R.V. Brewer
Assistant Purchasing Agent.

RVB/W



This Shipment of Six

Oliver Filters

Completes a total of eighteen OLIVERS in use by the Newport Mining Co.

"There is no item of equipment with which we encountered any less difficulty in shipment and delivery."

Oliver performance is on a par with Oliver methods of manufacture and shipment.

In metallurgical operations, chemical plants, sugar factories, cement plants, and munition works, the Oliver has revolutionized filtration methods.

Send for bulletin today.

CRUSHING ROLLS

To give satisfactory service must embody a combination of experience in design and operation, with skill in manufacture and extreme care in the selection of materials.

In the

DEWCO Crushing Rolls

Convertible Type

DENVER ENGINEERING WORKS CO.

Are embodied the experience obtained in fifteen years of successful manufacturing and improvements suggested by mill operators and engineers.

Thus have been produced a type of rolls in which all adjustments may be made without stopping rolls;

Distance between roll shells adjusted by worm gear and crank;

Lateral adjustment of shaft;

Swivel bearings, self-aligning; no cramping of shaft in bearing when one side of rolls opens more than the other;

Bottom as well as top of frame is machine finished;

Fitted with bronze bushings and grit-proof bearings;

Interchangeable journal boxes and shafts, and also with rigid or spring type;

Extra large shafts and journal boxes insuring longer life and higher speeds than with ordinary rolls;

Renewable wearing plates under sliding pedestals;

Shafts removable without disturbing tension bars or springs;

All large nuts are clamp nuts, small ones self-locking;

Rigid and spring roll parts are interchangeable, therefore, requiring but one set of spare parts.

¶ Our bulletin tells all about them, and gives valuable data on the proper selection of rolls to meet individual requirements. Send for it.

More than that are the small refinements in design, such as the care and thought that has been given to effectiveness and ease of lubricating all running parts, convenience and accessibility of all parts requiring adjustment, and general all around dependability that assures long-time service and comparative absence of shut-downs from any cause.

NOTES 369

THE IRON OF LORRAINE 371

The victory in French Lorraine by an American general of Alsatian origin; the significance of the mineral resources of Lorraine; relation of Verdun to the iron deposits of that province, being exploited by the Germans; a German geologist's part in the annexation of Alsace-Lorraine; the return of the lost provinces will make France dominant in European iron production, and cripple Germany; the furnaces at Briey shall be re-lighted by French hands and help repair the world that had been battered in the War for Freedom. M. & S. P., September 21, 1918.

THE NEW SLAV COUNTRIES 372

New importance of political geography; birth of a Czecho-Slovak state; development of Jugo-Slavia; responsibility of the Allies toward the new nationalities; a re-united and independent Poland; readjustments of boundaries on racial and linguistic lines will bring to Germany the sting of defeat. M. & S. P., September 21, 1918.

DISCUSSION

WAR-MINERALS BILL

By George R. Allen 373

Affirms that high prices for tungsten have not greatly increased the output; America cannot well stand a high fixed price for tungsten; actual prices for ore in China and Burmah; Korean production of scheelite; price for platinum higher in the Far East than in the United States; the graphite market; considers restrictions on war essentials ill advised. M. & S. P., September 21, 1918.

A PROTEST

By Engineer 374

Credit to the staffs of mining companies should pay regard to relative importance of the technical men in charge of operating. M. & S. P., September 21, 1918.

ARTICLES

THE DEVELOPMENT OF FLOTATION AT THE BROKEN HILL PROPRIETARY MINE, AUSTRALIA

By Edwin T. Henderson 375

First 50 tons of zinc concentrate produced by flotation with nitre-cake by A. D. Carmichael in 1903; by October 1905 output was 1000 tons per day; development of the Delprat-Potter process; outline of Broken Hill practice; origin of the Horwood process; oxidizing the lead associated with the blende in the wet way; technique of the Horwood process; Bradford salt-sulphuric acid process; SO_2 in flotation at Broken Hill. M. & S. P., September 21, 1918.

LEAD SALTS IN CYANIDATION

By Thomas B. Stevens 380

Lead acetate in cyaniding; substitution of lead nitrate at Homestake; alkaline plumbites employed in Australia; technique of the use of lead salts in cyanidation. M. & S. P., September 21, 1918.

ROTTERDAM, THE DISTRIBUTING CENTRE FOR THE C. R. B.

By Walter Lyman Brown 381

Rotterdam, the new port of entry for Belgium; personnel of the Commission for Relief in Belgium; populations reached by the Commission; shipments into Belgium and northern France in the last three years; details of transportation and distribution of supplies for Belgium; difficulties in dealing with the Germans; effect of the submarine blockade; cost of the relief operations. M. & S. P., September 21, 1918.

TYPOGRAPHY FROM MOVING OBJECTS

By A. J. Sale 387

Simple methods of overcoming deficiency in apparatus for topographic reconnaissance; improvised scales, methods of performing operations of mechanical draughting with home-made appliances; making observations from moving objects, and plotting the topography; utilization of the methods in military observation. M. & S. P., September 21, 1918.

PRODUCTION OF SODIUM SALTS 390

Salt-cake and its uses; nitre-cake, its production and value; manufacture of sodium sulphide and sulphate. M. & S. P., September 21, 1918.

Makes Two, Three and Four Mineral Separations

The WILFLEY TABLE is so correct in principle and so perfect mechanically, that it can be adapted to meet most any condition. One large company writes us that they are using WILFLEY TABLES to separate a difficult lead-silver-zinc ore (90% passing 200 mesh), and making a lead-silver concentrate, iron middling, zinc concentrate, and tailings to waste.

This is a fine example of the kind of work that can be done with the

WILFLEY TABLE

Wilfley decks are made of selected California Redwood and are supported at each corner by dust-proof slipper bearings. Each bearing is independent of the other.

By raising the bearing at the lower concentrate end, the discharge end may be set in a horizontal plane and still maintain the slope at the feed end—an important Wilfley feature.

In this manner the pulp is thinned out and brought higher up on the table deck, making possible clearer stratification of the different minerals.

This perfect distribution of the minerals, of the middlings and tailings, is possible only on the Wilfley Table.

Wilfley Table reputation extends around the world. The following orders have been received during the past few weeks: 64 Wilfley Tables, Burma Corporation, Ltd., Rangoon, Burma; 60 Wilfley Tables, Union Miniere du Haut Katanga, Belgian Kongo.

HOW unrepentant the Kaiser and his ministers still are is suggested by the nomination of one of the princes of Hesse to the crown of Finland. They seem not to have realized that kings at best are belated anachronisms and that the Prussian kind of king is intolerable in a world that knows what Willie and Nicky, Joseph and Tino, have done in the way of scheming and bloodshed.

EACH successive issue of Liberty bonds finds the people better prepared to absorb them, because a campaign of education has been in progress almost continuously since the first Liberty loan was launched. The benefit of thrift in behalf of the Cause is being appreciated, both for the good it does to the Nation and to the citizen. At this time, when the American eagle has filled the air with feathers of the discomfited German vulture, it is obvious that no safer security is available for the savings of the careful man, and that the rate of interest is high considering the gilt-edged character of the investment. If that be insufficient inducement, look at the casualty lists and consider how little you, who are safely at home, can do—and how you are in honor bound to do it—in comparison with the supreme sacrifice.

BRASS manufacture has failed to keep pace with the needs of the Government, partly by reason of the shortage of labor, and partly from the continuance of non-essential uses of brass in the arts. A conference of the brass-makers with the War Industries Board has resulted in a decision to restrict the use of the alloy in many industrial branches, and to employ every possible means to increase the output. A re-distribution of Government orders will be made, which incidentally will curtail the ability of the manufacturers to supply private parties. The gross production of brass at present is 2,910,000 pounds per day. It is estimated that the output can be increased to 3,390,000 pounds by administrative improvements in the works, and by obtaining a larger number of laborers through the co-operation of the Government Employment Bureau.

WE are informed that the Colorado meeting of the Institute was a most pleasant affair and was well attended, despite the lack of a reason for such a meeting at this time. The speeches at the banquet are said to have been numerous, and good. The President, Mr. Sidney Jennings, made an eloquent appeal to the women to stand firm against premature talk of peace; the ex-President, Mr. Philip Moore, was welcomed heartily on his return from Alaska; Dr. Ricketts gave an almost lyrical description of a young man's opportunities in the South-West; Mr. Horace Winchell contributed sundry impressions of Russia that were not lacking in the sardonic humor that the miserable plight of that befooled people invited; Mr. Mathewson was in excellent form, and Mr. Tom Stearns told a story that made a lasting impression on the ladies.

LEST we forget, let us recall what the Germans did at Lille during Holy Week in 1916. They invited the inhabitants of that French industrial centre to raise crops for them, the invaders, and when the Lillois refused they seized 20,000 of them and compelled them to labor, strong and frail, boys and girls, any that were more than 15 years of age, in their own fields, to gather crops while under guard of soldiers armed with guns and fixed bayonets. Think of that slave-driver in his field-gray uniform as he bullied groups of women just behind the line of battle where their husbands were fighting for their homes. That was 'frightfulness,' the fine flower of kultur. It was the Bavarians under Prince Ruprecht that did this shameless thing, for the Prussians have found other Germans fully capable of following their lead. The yellow streak runs through the German character and the War has developed it as with hyposulphite. When the day arrives for settling the account, do not forget the deportations at Lille.

GERMANY'S moral bankruptcy has been completed by the revelations made at Washington by the Committee on Public Information. This extraordinarily detailed exposure of base intrigue on the part of the German government and the unmasking of the treachery of the German-Jew anarchists that posed as Russian Socialists comes at a moment when the First American Army has scored a clean-cut and complete success at St. Mihiel, proving that the Intelligence Department and the Army are co-operating in the discomfiture of the pirate crew at Berlin. They stand outlawed by every code, human or divine, the meanest, savagest, stupidest gang of conspira-

tors that ever attempted to undermine civilization. The exposure, when it becomes known in Germany, must knock down the last under-pinning of confidence that the German people may yet retain in their leaders, military or diplomatic. The stupidity with which the despoilers of Russia allowed the evidences of their intrigue to be multiplied in written documents and the skill with which Mr. Edgar Sisson collected and pieced together all the proofs in the case, expose again the futility of the German spy system and deride the conceit of the barbarians that set out to impose their ways of thinking and living upon a prostrate world.

ON August 30 the United States Mints and Assay Offices received instructions from Washington to cease selling gold to individuals for industrial purposes. This order was provoked by the steady increase in the demand from jewelers, dentists, and makers of optical goods. It was noted that, during the fiscal year ending June 30 last, gold to the amount of $55,000,000 had been withdrawn from our national reserve, ostensibly for use in the arts. The Government officials feared that this bullion in part was being hoarded, and the privilege of further purchase accordingly was denied. A universal protest from the affected industries instantly arose, and it was evident that an open market for new gold at an advanced price would be created unless the ruling were modified. Therefore, a supplementary order was issued on September 6, permitting the purchase of gold from the Government at the standard rate per ounce, but under regulations that ensure its consumption in certain specified essential industries. This episode has an important bearing on the proposals recently made by the American Gold Conference and other organizations toward obtaining financial aid for the producers of new gold. It reveals the anxiety of the Treasury Department to increase the gold-reserve, and it accentuates the need of a stimulus to gold mining in order to provide the metal needed for industrial as well as for monetary uses.

GERMANY'S defeat is made evident, not only by the retreat of the invaders in France, and by the verbal inexactitudes of the reports issued at Berlin, with their pitiful attempts to obscure the facts, but by the speeches of her leaders, the Kaiser, the Chancellor, and the Vice-Chancellor. They are whining and they are lying in a panicky effort to reassure a panic-stricken people, at last beginning to realize how they have been deceived, exploited, and misled. Not even the record of men and guns captured from the Enemy tells the story of his defeat so plainly as the text of the Kaiser's speech at Essen. It is a remarkable example of the German way of imputing to others their own ideas and of disclaiming bad intentions as soon as those intentions have been thwarted. The paranoiac Kaiser asserts that it was the English who "introduced terrible hatred into this War" and that he "left no stone unturned to shorten it"—yes, by falling upon his neighbors when he thought them unprepared for his attack. Now comes the Austrian overture for a conference, hastened by the dissensions among the various racial units in the unhappy political partnership that goes by the name of the Austrian empire. There should be no discussion with the Central Powers until they have withdrawn from Belgium and France; the only conversation required at this time is two words: evacuation and restoration—of the countries they have invaded and marauded.

APROPOS of the restriction upon the use of hydro-electric power that has been found necessary in California, it is worth while to note that the estimated potential energy available in the State is 8,865,000 hp., and that only 8.2% of this, or 722,125 hp., has been developed. Oregon has a possible 7,505,000 hp., of which no more than 2.1% has been made available at the switchboard. Cheap abundant power is one of the greatest sources of wealth and a potent stimulus to industry. The New England States have utilized 47.1% of their natural power resources, and Michigan has brought into service 64.2% of its potential hydro-electric energy. It has been suggested that one of the most useful enterprises of the Government at the close of the War would be to employ a part of the technical talent and skilled labor of the returning Army in the construction of plants for developing this latent energy for the expansion of industry. That it would ameliorate economic conditions is indubitable. It would also demand large amounts of copper and other metals, which would tend to relieve the difficulties of the miners. The project is closely related to the electrification of the railroads, which, according to a recent statement by Director W. G. McAdoo, has become imperative. He declares that it may be necessary to undertake it even while the War is in progress, as a means for relieving the shortage of coal. The problem will be attacked first at the points where the static value of the available water is greatest, that is, in the mountainous districts of the West and South. Also electrification will be adopted as a means for simplifying the handling of freight at terminals. The economy of labor in operating that would ensue upon making such changes is regarded as offering advantages sufficient to compensate for the temporarily increased demand for labor involved in manufacturing and erecting the equipment.

BY courtesy of the Commission for Relief in Belgium we are enabled to publish an article by Mr. Walter Lyman Brown describing the distribution of supplies imported at Rotterdam, which is the chief distributing centre for the C. R. B., as it is generally called. Like the other members of the Commission, Mr. Brown is himself a mining engineer not without honor in his own country. We are informed, by headquarters, that he "has had a hard job" and deserves much credit for the excellent manner and spirit in which he has conducted his arduous duties. Before the negotiations with the Netherlands government were completed, the Commission had a great deal of trouble with the Dutch people while passing supplies for Belgium through Holland, owing to

the shortage of food in Holland itself. There were riots on the docks, and attacks on the American government appeared in the Dutch newspapers, a result by no means astonishing if it be remembered that the people of Holland were short of food and had to pay fabulous prices for the most ordinary commodities, while watching the transfer of 60,000 to 70,000 tons of supplies through their own ports to Belguim. Mr. Brown faced these unpleasant conditions manfully and overcame them in due course by the manifest sincerity of his efforts. His assistant for some time has been Mr. A. C. B. Fletcher, of California. Not only has food been supplied to the Belgians, but clothing and shoes as well. Gifts of clothing, so Mr. Brown informs us, have been received from all over the world, and in this benefaction California has been conspicuous, thanks to the good work done by the Californian Committee and Mrs. Vernon Kellogg. When the parcels arrive they have to be opened and searched for papers or letters, in order to prevent trouble with the Germans. This removal of letters is done regretfully, because many of them, accompanying gifts from American to Belgian children, are most touching and would gladden the hearts of the recipients. About 2,000,000 garments have been distributed in this way and they continue to arrive in increasing quantity, besides the purchases for the same purpose made by the Commission itself, amounting to 15,000,000 yards of cloth, 3,000,000 pieces, and 540,000 pairs of shoes. Nevertheless, as Mr. Brown takes pains to suggest, the need for more is pressing, owing to the complete exhaustion of stocks in the country, "so that now, as for food, the nine million Belgians rely almost entirely on the all too small amounts that the C. R. B. can ship." We quote this message in the hope that it may stimulate further gifts. If there is one thing more than another of which the United States may be proud it is not the money subscribed to the Commission, for the subscriptions have been relatively small, but the executive ability and fine spirit contributed by a group of American mining engineers to the work of the Commission in Belgium.

The Iron of Lorraine

An American General of Alsatian origin has achieved a complete victory in French Lorraine. In truth, General Pershing and his troops have started the liberation of a part of France that is of the utmost value, not only in sentiment, but industrially, for in the department of Meurthe-et-Moselle, historically a part of Lorraine, are the great deposits of iron ore essential to the life of French industry. The American troops, after erasing the salient established by the Germans four years ago at St. Mihiel, are approaching Briey, which is at the southern end of the Longwy-Briey iron district. Another less important portion of the Lorraine iron deposits is centred at Nancy, which the Germans have tried repeatedly to win. The tremendous effort made to capture Verdun was prompted, in large part, by the Enemy's desire to obtain a firm grip on the iron resources of France, for not only did the holding of Verdun protect Nancy but it interfered with the German exploitation of the iron ore at Briey, where in 1912 four mines produced 5,600,000 tons of ore, equivalent to about a third of the French production in that year. From the citadel at Verdun, the French have been able to see, at night, the flare of the blast-furnaces in which the invaders have been smelting the ore and obtaining the iron for use in killing the rightful owners of the mines. These metallurgical operations, needless to say, have not been uninterrupted by the French artillery. The cathedral of Rheims has been battered by shells made from iron mined in France. Great is the importunity for driving the despoilers from Lorraine. It is said that, when Bismarck was imposing terms upon France after Sedan, he was advised of the importance of the mineral resources of Lorraine by a

MAP OF THE WESTERN BATTLE-AREA, SHOWING THE IRON DEPOSITS OF LORRAINE AND THE COALFIELDS OF FRANCE, BELGIUM, AND WESTPHALIA. THE FIGHTING-LINE IS NOT MARKED BECAUSE IT CHANGES SO RAPIDLY FROM DAY TO DAY.

German geologist. If that be true, then the German geologist made an egregious blunder, for he mapped the ore-zone incorrectly, otherwise all of it would have been included in the territory seized from France in 1871. Indeed, the recovery of Alsace and Lorraine means more to France than appears on the surface. The return of the people and the soil of the lost provinces is the recognized prize of victory to France, but underneath the surface is a great industrial treasure, the famous deposit of 'minette,' an iron ore that is comparatively low-grade, averaging only 35%, but existing in a deposit so big and so shallow that it can be mined cheaply. The ore-zone is 8 miles wide, 40 miles long, and as much as 60 feet thick. In 1913 the Longwy-Briey basin yielded 15,147,000 tons of the total French production of 21,700,000 tons. In the same year the part of Lorraine taken from France in 1871 gave the Enemy 21,136,000 tons out of her total production of 28,600,000 tons. The deposits extend also into Luxemburg, which, in 1913, produced 7,333,000 tons, making a total of 43,616,000 tons mined in this region as a whole, the equivalent of 13,800,000 tons of iron. When the lost provinces are regained, the French production of

iron ore will increase to 43,000,000 tons, while that of Germany will decline to 7,500,000 tons. Before the War, according to the statistics of 1912, there was exported 4,673,000 tons of 'minette' ore to Belgium and 2,798,000 to Germany. The scarcity of coking-coal, needed for smelting the iron ore, compelled this exportation, in return for imports of coal from German Westphalia and from Belgium. The output of the Valenciennes coal-field is not as suitable for smelting the ore. Hence in time of peace there was a mutual exchange of raw materials between France, Germany, Belgium, and Luxemburg, a friendly co-operation of which the Germans took advantage in order to obtain the information that they needed for their predatory campaign. It is no wonder that a German writer, Dr. J. Reichert, of Berlin, in an article appearing in the December 1917 issue of the 'Weltwirtschaft,' explains: "The occupation and exploitation of the Briey-Longwy deposits saved us in this War. We live and breathe because we are able to defend our country and our life with the iron of Lorraine"; to which a French commentator, M. Henri Hauser, probably of Alsatian origin, now of the University of Dijon, replies: "Briey and Longwy—this is for Germany the means of re-making her fortune when peace is restored; this also is the means for preparing for—or not having to fear—the next war. That is why M. de Schoen, in 1914, was told to demand Toul and Verdun from us. That is why the Crown Prince hurled his army against Souville and Douaumont. That is why Germany will defend Briey to the very end." And, shall we not add, that is why the American army under Pershing will continue to crumple the German lines until the invaders are driven from the blast-furnaces at Briey, when their fires, re-lighted by French hands, shall flare in the night like the dawn of a new day, when the soil of Lorraine and all that lies beneath shall be delivered from the hands of the despoiler, and returned, with joyous acclaim, to our gallant Ally. *Chaque homme a deux patries, la sienne et la France!*

The New Slav Countries

Political geography is a subject to which the average American paid but little attention in those far-off days before Armageddon, for he was sufficiently occupied with the development of his own continental area and the relations between the States in the Federal union. To the mining engineer, however, some knowledge of world-wide geography was vouchsafed if only because he traveled across the seven seas to distant lands in the performance of his professional duties. Of late, thanks to the War, which is a stern educator in many other ways, he has had to learn more about political boundaries than he ever thought it necessary in years gone-by. The romantic emergence of the Czecho-Slovak armies in Russia and the recent recognition of a Czecho-Slovak state by the governments of the United States, Great Britain, France, and Italy has provoked interest in racial and political facts heretofore outside the ken of the average well-informed man. Not only has a Czecho-Slovak state been formally recognized by the principal Allies, but another political entity, Jugo-Slavia, is receiving sympathetic consideration, among others from Italy, the country that might seem to have good reason to resent the creation of such a state. Thus two new countries are being placed tentatively on the map by the student of European politics, the first to include Bohemia, Moravia, and a part of northern Hungary, these three contiguous regions being inhabited by Czecho-Slovaks; the second to include Serbia, Montenegro, Bosnia, Herzegovina, Dalmatia, Croatia, and a part of southern Hungary, that is, a consolidation of regions inhabited by the Southern Slavs, the word Jugo being Serbian for 'south.' Czecho-Slovakia will be separated from Jugo-Slavia by the valley of the Danube and central Austria. These events threaten to add new complications to the settlement of international relations at the end of the War; they involve the Allies in fresh responsibilities toward the struggling nationalities in Europe, but both the complications and the responsibilities will be faced frankly and sincerely because they form an essential part of the readjustment made necessary by the outbreak of Prussian barbarism. The creation of these new States involves the disintegration of the ramshackle empire that took the first step in bringing this cruel war upon the world and it likewise involves a frustration of the German purpose to exercise suzerainty over Austria-Hungary as a part of the policy that was to create a Mittel-Europa under the aegis of the Hohenzollern dynasty. Austria-Hungary has been stewing in the juice of internal racial dissensions for a long time, in the expectation—at Berlin—that when the morsel became sufficiently tender it could be assimilated by Germany without the least symptom of political dyspepsia. That pleasant little repast is indefinitely postponed and instead of it there has been given a chance for freedom to sundry isolated and politically exiled peoples that have too long suffered the domination of the Hapsburgs and Hohenzollerns. There is going to be a slump in kings when this war is over. Another rectification must follow the creation of the two Slav countries, and that is the resuscitation of Poland, not as a kingdom, but as a separate country, and not as an appanage of Germany, Austria, or Russia, but as a free people. Again we must turn to the political atlas in order to realize how much such an idea involves: not only the Russian Poland that we knew before the War, but also Galicia, or Austrian Poland, and the old German Poland that included parts of Silesia and of Posen from the borders of Galicia down the Vistula to the Baltic coast at Danzig, making altogether a territory equal to about one-third of Germany or of France, these being nearly equal in area. Such readjustments will put an end to Prussianism, and in them the Germans will feel the sting of defeat; nay more, in the creation of these buffer States, not political abortions, but real entities based upon racial and linguistic harmonies, will be found the best insurance against a repetition of the nightmare of horror that has been brought upon the world by the arrogant ambition of the Kaiser and the deliberate design of his misguided people.

War-Minerals Bill

The Editor:

Sir—During the past six months, I have read carefully many articles that have appeared from time to time, in your magazine, and I have failed to note one word favorable to the consumer.

It would seem that the object of the Bill was to protect the owner of low-grade mines, not for the present but after the War. If the United States controlled the world's markets of rare minerals, such a move might be recommended, but up to the present, the returns have not shown even a fair proportion.

With prices of tungsten ranging about $90 per unit, and the entire mining community hot after new properties, the returns did not show any great increase. It is true, many small properties were opened up, only to be closed down when prices dropped to $30 per unit. With present prices, three times what they were prior to the War, it was necessary to import into the States more than was produced; something like 5000 tons (long) being imported as against only about 4000 tons (short) of home production.

As the Allies are depending upon the States for large consignments of different rare minerals and alloys, it seems improper to curtail them at this time. It seems equally wrong to establish war prices for the present and to continue after the close of the War.

It is asked that a price be set at about $40 per unit, this being necessary to protect the small producers. Can the consumer or producer of tool-steel stand such a price and meet competition from Germany or Sweden after the War, when they are able to buy tungsten for half the price? It is claimed that a 0.75% ore is better than the average of the home mines. Therefore for such poor veins protection is necessary. Our dumps over here carry over 1%.

It was reported to the War Board committee that the Burmah mines were only asking $12.60 per unit; that a similar price existed in China, or rather c.i.f. prices New York. The facts are: Great Britain established a war price of 60 shillings c.i.f. London for everything from her colonies, prohibiting exports elsewhere. This did not prevent her manufacturers from buying on the open market when supplies ran short. The same with France; high prices were discouraged. Prices were made and set by the governments, therefore it is unfair to consider the prices as normal. This was recently shown when conditions at Hongkong were changed. Great Britain claimed that the tungsten that entered a British port could not be shipped except to England and at the Government price. The Chinese shippers raised an objection, which was seconded by the U. S. government, and the embargo at Hongkong was raised. Since then the Chinese price has been about $19 c.i.f. New York for a product averaging 68%.

Already we have been hit rather hard with restrictions. First graphite, then molybdenite, to be followed by manganese. Unfortunately these restrictions did not reach this part of the world until after the date of expiration. Americans that have cash invested in mines as well as in advances on ores, as they come in preparatory to shipping, were hit hard, but we understand the situation. Not so with the native mine-owners, who immediately come back at us with the query, 'Japan being an Ally, why are minerals necessary for war purposes prohibited, with conservation of space given as an excuse, when such truck as cheap porcelain, etc., taking up thousands of tons annually, is not restricted?' When these parties are left high and dry with cancelled contracts on their hands, they feel that a fair deal has not been given them. It must not be presumed that they will cease doing business, but will we be able to enter into future contracts with them after others have made long future contracts to take effect after the War?

Permit me to touch on several minerals that, as an exporter to the States, have come under the restrictions to date:

TUNGSTEN. In the report given by Mr. Manning, it is stated that there are sufficient mines in the States to produce all that is necessary. No doubt this statement is a fact, if the small veins are made to produce profitably. Again I ask, with a 10% or more tungsten used in special steel products, can our manufacturers produce, export, and meet foreign competition and pay $40 per unit for a 60% product, with the outside market standing at $20 per unit for a 65% product? Is it wise to curtail our exports of steel in order that small mine-owners may be protected? My argument falls flat if competition will not be injured by this difference. Atolia claims to have a mine that carries 0.75%. We control a property that carries nothing but crystal aggregates weighing even over three pounds each, analyses averaging 76%. Korea is at present producing an average of 110 long tons monthly of both scheelite and wolframite—mostly from hand-concentration as well. Bar this product from the States and it will go where it did before the War—to Germany. Have we no fears of competition from that source? If Germany becomes the only buyer, naturally

she will force the price down and take the entire ouput. Is this not something to count on?

As I have repeatedly stated, we can deliver c.i.f. New York for $12 per unit, if forced to do so, and still make a reasonable profit. Is it not therefore better to fix a fair price, establish duty, and give the steel manufacturers a chance?

MOLYBDENITE. Similar conditions exist. The restrictions became known here four days after the expiration date. We had 14 tons on hand. We sold elsewhere, but at a 25% loss. We shipped only flakes, hand-picked, over 90% MoS_2. This product is all going at present to Europe, and at prices far less than those prevailing in the States.

PLATINUM. Evidence was introduced before the War Board to the effect that platinum was necessary during the War and that we had been depending upon Russia for our supply. What has happened? It is now deemed necessary to commandeer all stocks, to cover up the shortage, whereas during the past six months more platinum has been offered for sale here than ever before. It is being brought in by Russian refugees. How can exports to the States be expected when an arbitrary price has been set at $105 per ounce? With exchange at 53⅛ we can dispose of every ounce offered at what would be equal to $108 per ounce right here to buyers for European countries. Just why my Government placed such a low price on an article that is not found at home except in very small quantities I cannot understand. The same applies to iridium.

MANGANESE. Here we have a different condition: one that involves large tonnage. But the native again has his little say: "Why when we worked hard and in good faith to supply your wants, you now refuse deliveries because your country does not want same. If you had given us the opportunity to ship all under way, we would not feel so; but to place orders and then decline to accept, after we had shipped from the mines, is not fair dealing." So it runs, and the future will tell the consequences.

GRAPHITE. A very unfortunate condition. We were hit rather hard because we had no time to catch the first steamer even before the restriction came into effect. Only after extra hard work were the exporters able to secure flake graphite. Cables galore were received asking that shipments be increased; it was required for a blend in making crucibles; capital was invested, and cash had been advanced, only to have everything stopped without a moment's notice and the excuse given that it is necessary to protect the Alabama mine-owners. The present prices have dropped nearly 40% and long forward contracts have been made for shipments to England. Our home prices, we understand, have advanced.

My position, as an American of the fifth generation, is to accept all orders as they are issued. I also feel it my duty to explain conditions as I find them over here. I may be entirely wrong. I am not against the small producer or owner of a low-grade mine; but if we start protecting such properties, why not protect everything in the same ratio?

When mills are erected in Korea and Manchuria, the world will note a new mining centre. But even though labor will be cheap and freights within reason, prices will never be satisfactory under the prevailing market.

Can the mill-owners afford to pay double the market-price for raw materials and compete abroad? Now is the time to consider such points. Already outside interests are at work. Contracts can be made for years to come, and when one knows that the Japanese have nothing against Germany and are at present merely following the dictates of the British alliance, we cannot take issue against Japan, should she feel inclined to deal direct with Germany after the close of the close of the War—not as a nation perhaps, but I doubt whether restrictions will be placed against business dealings with the Germans.

For the period of the War at least, I doubt the merits attached to placing restrictions on war necessities, such as raw materials, when produced by an Ally. Far better to restrict unnecessary articles if the conservation of space is the reason.

GEORGE R. ALLEN.

Seoul, Korea, August 6.

A Protest

The Editor:

Sir—I have just received a report of a very successful mining company operating in the West that, among other statements, gives full credit to the staff engaged, which is right and proper. My object in writing to you is to call attention to the sequence in which credit is given to the various departments: Assistant General Superintendent, Secretary and Purchasing Agent, Chief Clerk, Mine Foreman, Mill Foreman, Master Mechanic, Mining Engineer, Geologist.

Were I the engineer or geologist of that mine I certainly would prefer not to have my name mentioned, if it had to follow that of a clerk or foreman. Why educate our sons to be engineers if the mining operators rate them below clerks and laborers, high-class though they be?

ENGINEER.

Denver, Colorado, September 6.

CARBOCOAL is the name applied to a new product from bituminous coals now being made under control of the Government at Clinchfield, Virginia. The peculiarity of the process is that the coal, instead of being coked, is distilled at a temperature below 900° F. The residual material contains about 4% volatile matter, and burns readily on a grate, with a smokeless flame. Briquetted carbocoal has been tested by the Navy, and is reported upon favorably as a fuel for warships. The distilled products contain far larger amounts of toluol, naphthas, creosotes, ammonia, and other products than are obtainable by means of by-product coking. The process has been developed by Charles H. Smith.

The Development of Flotation at the Broken Hill Proprietary Mine, Australia

By EDWIN T. HENDERSON

Toward the end of 1902, with a view to finding a means of obtaining a zinc-concentrate from the dump-tailing, the late A. D. Carmichael, the company's research chemist at that time, was instructed by G. D. Delprat, General Manager for the Broken Hill Proprietary Co., Ltd., to carry out some experiments with nitre-cake (sodium-sulphate) of which we had a large stock. It was observed on placing some of the tailing in a strong solution of this salt in a beaker and heating it, that the sulphides were floated as a high-grade concentrate leaving the gangue in the bottom of the beaker.

An experimental plant was immediately started, and the results obtained were so encouraging that patents were applied for in November 1902, it being believed that this was something absolutely new in concentration methods.

Considerable difficulty was experienced at first in placing this new process on a commercial footing. First one type of separation vessel was tried and then another, until about a dozen had been used before a suitable one was designed. However, by the beginning of May 1903, fifty tons of zinc-concentrate had been produced by the process from tailing that was ordinarily dumped. This parcel was the first 50-ton lot of zinc-concentrate ever produced by flotation. After this the process made rapid strides, and by October 1904 was treating 500 tons of feed daily, which amount was gradually increased until, by October 1905, the output exceeded 1000 tons per day.

For the first four years this Delprat process was the subject of considerable litigation, the cause of which was a prior patent taken out by the late C. V. Potter, in November 1901, for obtaining the same result by the use of dilute acid solutions. Potter's patent was wide in its claims, vague, and in several parts erroneous, and it was contended that his patent was invalid, this contention being upheld by the Courts through which it passed. It was finally sent to the High Court, but prior to coming before that tribunal an agreement was reached between the parties concerned by which the Broken Hill Proprietary Co. obtained the free use of either the Delprat or the Potter patents.

From this time onward, owing to sulphuric acid being substituted for nitre-cake in the solution, the method became known as the Delprat-Potter process. It has been free from litigation, but the patents have now expired.

Although this process has been the subject of previous papers, there still seems to be some doubt in the minds of certain writers concerning some of the details, so that a brief outline of our practice at Broken Hill may be of value.

The feed consists of various tailings produced in the gravity-concentration mills, either from crude ore or old dumps, by crushing, jigging, and tabling for the removal of the lead, and classification for the removal of the slime. It is delivered to the bins of the flotation plant by a series of belt-conveyors.

This feed assays from 13 to 15% zinc, from 3 to 3.5% lead, and from 5 to 6 oz. silver per ton. An average sizing-test shows:

		%
On	40	7.0
"	50	6.5
"	60	10.5
Through	60	76.0

The gangue in the feed consists mainly of rhodonite, garnet, and quartz, with small amounts of fluorspar, calcite, and siderite. The feed as delivered to the plant carries from 9 to 11% moisture.

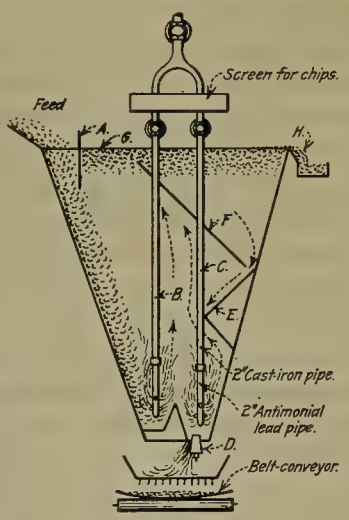

FIG. 1

The feed-bin has a capacity of 170 tons. The conveyor is set on top of this bin, and the feed can be dumped at any desired point. The discharge from the bin is by means of twin Archimedean screws set in the bottom of the bin opposite each separating-vessel. The amount discharged is regulated by slide-doors, which on being lowered partly cover the forward ends of the screws.

The cast-iron separating-vessels, of which there are five, are of the shape shown in Fig. 1. They are 9 ft. square at the top, 2 ft. by 1 ft. at the bottom, and 15 ft.

deep. The feed from the screw-feeders is delivered behind the baffle *A*, which dips a few inches below the level of the solution. It then slides down the back until it reaches the solution-jets at the bottom of the pipe *B*. These jets deliver the solution at a pressure of approximately 15 lb. per sq. in., at a temperature of 200° F. and an acidity of 1% H_2SO_4. The object of these jets is to keep the feed in suspension while the acid acts on the carbonates in the feed, liberating CO_2. This gas attaches itself to the sulphides and floats them to the surface. The back-jet *B* washes the feed to the front of the vessel where it meets another jet *C*, which gives it the final treatment. Any stones or other foreign matter in the feed lodge in the pocket below the jet *B* and accumulate there until such time as the vessel is emptied, when they are removed.

The tailing, after treatment by the jet *C*, passes through a hole in the plug at *D* in a practically continuous stream. The up-current in the separating-vessel, together with the stream of sulphides floating to the surface, tends to carry up some of the lighter gangue. In order to give this a chance to separate, two baffles are placed in the vessel. The one shown at *E* deflects the rising sulphide from the front and causes it to come into contact with the baffle *F*. It then moves up the under side of this and is delivered at the surface at the point *G*. It then floats toward the overflow at *H* on comparatively still water, and most of the gangue that was carried up falls again on to the top of the baffle *F*, down which it slides and falls to the bottom of the vessel.

The concentrate overflowing at *H* passes in a launder to a settler, where most of the accompanying solution is separated. The solids, together with a small amount of liquid, pass through plug-holes in the bottom of the settler on to a belt-conveyor, where the solution is drained and the concentrate removed to the bin. The tailing delivered at *D* falls into a trough with a perforated bottom, which breaks the fall, and then to a belt-conveyor where the solution drains and the tailing is delivered to a series of conveyors, which takes it to the dump.

The solution separated from the concentrate and tailing contains a small amount of slime, and to remove this it is passed over settlers. It is then pumped to the elevated solution-tanks, which give it the necessary head, by the Harris system of pumping by means of compressed air. This is done in two stages, the first lift being about 40 ft., and the second about 30 ft. Between these two lifts the solution passes through another settler, to remove any remaining slime, and then to a box feeding the second lift. To this box sufficient acid is added to bring the solution back to approximately 1.0%. Air-jets are used as a stand-by in case anything happens to the Harris pumps.

The fall in temperature of the solution is about 25° F. It varies slightly, depending on the temperature of the atmosphere and the feed treated. The consumption of acid is about 26 lb. per ton of feed treated. Approximately 30,000 gallons of solution are circulated per hour in the plant when running full and treating 80 to 85 tons per hour. The temperature of the solution in the elevated tanks is kept between 200 and 212° F. by blowing in superheated steam from the B. & W. boilers.

All the solution-pipes and the separating-vessels are made of cast-iron. On first being used they are slightly corroded by the hot acid solution, but they soon become coated with a thin layer of graphite from the iron, and this protects them from further corrosion. The separating-vessels and the return-solution pipes become coated inside with a layer of gypsum, which gradually grows in thickness and has to be removed occasionally. This deposit of gypsum is greatest wherever the solution is subject to a sudden fall in temperature, for example, where the air enters an air-jet.

Each separating-vessel treats from 15 to 20 tons of feed per hour. They require very little attention, and the whole plant is as nearly fool-proof as anything can be. The life of the separating-vessels is practically unlimited, provided the bottom portion is protected from abrasion by inserting a lining of wood.

Only 12 men and 2 boys are employed in the plant to treat 550 tons per shift of eight hours. The repairs are light, as there are few moving parts that come in contact with the feed or solution. The cast-iron screws on the feeders are made so that they can easily be replaced. The jets in the bottom of the separating-vessels are made of antimonial lead, and are burnt onto a 2-in. lead pipe; this pipe is about 18 in. long, and is flanged at the top and bolted to the cast-iron pipe. These can be easily removed when the holes become too large by replacing them with spares, the old ones being sent for repair.

The plugs that let the tailing out are made of antimonial lead; they are cast in a mold and are quickly and cheaply made. These plugs can be lowered by means of the lever-gear to which they are attached and enable any foreign substance to be discharged through the 4-in. diam. plug-hole. The hole in the plug itself for the discharge of the tailing is made about ¾ in. diameter. The The worn plugs are melted, a small amount of fresh metal being added to make up for the wear. It is then re-cast. The plugs can be easily changed while the pan is in operation. A lever with a forked end is placed under the shoulder of the plug to be removed to hold it in position; the spindle that supports the plug is then lowered and a new plug placed on it. The forked lever is then withdrawn, so as to allow the old plug to fall, the new plug being raised into its position. The wear on the hole through these plugs is largely taken up by inserting iron rods of varying thickness, according to the amount of wear, and they are only changed when the hole becomes too large for this treatment.

That portion of the separating-vessel that comes under the action of the solution-jets is lined with wood to prevent the sand scouring the cast-iron sides. This wood is renewed when it wears. The plug-seats are cast of antimonial lead, but these do not require to be renewed often, as the plugs fit well into them, and there is practically no leakage between the seat and the plug.

The concentrate produced by this treatment averages as follows: zinc 47%, lead 6%, silver 13 oz. per ton. An average sizing test shows:

	%
On 40	7.7
" 60	15.1
" 80	21.5
" 100	13.5
" 150	14.1
" 200	11.1
Through 200	17.0

The tailing assays 3% zinc, 2% lead, and 2 oz. silver per ton.

Some doubt has been expressed as to whether oil is used in this treatment or not, and I wish to make it perfectly clear that oil is not used in any shape or form in this process. It has been suggested that oil was introduced into the solution by using exhaust-steam from engines to heat the liquor, but since nothing but live steam from the B. & W. boilers is used, this is obviously not the case. It has also been said that the ore in passing through the milling operations picks up oil used for lubricating, and also that while being mined it is splashed with oil from the rock-drills; some even suggest that the ore naturally contains oil. No doubt some oil does come in contact with the ore in the milling operations, and also underground, but the amount is infinitesimally small, and although the concentrate produced has been tested on several occasions no trace of oil has been detected.

To show that the float is made without any oil, some ore was crushed and heated at a temperature of 400°C. for one hour, which should destroy any oil present. It was then treated with a 1% H_2SO_4 solution made up with distilled water and strong acid. A good float resulted.

This process is not adapted for the treatment of slime. The feed contains approximately 2 to 3% of slime, but if this amount is increased appreciably a low-grade concentrate is the result. The slime is also high in lead, and if included in the feed to this process it would raise the lead content of the concentrate produced. For the above reasons, the slime is separated as thoroughly as practicable from the sand in the milling operations, and only the sand sent to this plant. For some years the slime was run to dams and stored, awaiting a suitable treatment.

In 1910, Leslie Bradford discovered that by agitating this slime with a heated acid solution in a centrifugal pump, delivering into a separating-vessel, that the sulphides would float as a high-grade mixed lead and zinc concentrate, without the use of oil. A plant was erected capable of treating 3000 tons of slime per week. This was run for several months, and produced several thousand tons of concentrate assaying zinc 34%, lead 25%, and silver 40 oz. per ton. The tailing assayed zinc 4%, oxidized lead 8%, total lead 9%, and silver 4 oz. per ton.

This concentrate was roasted and sent as feed to the zinc-retorts at Port Pirie, but the quantity produced was largely in excess of the amount required for this purpose, and the plant was closed down until such time as the supply of concentrate was used up, or until a more favorable market became available.

The temperature required for this treatment was 140° F., and the acidity of the pulp was about 0.3% H_2SO_4. The separation was complete with four agitators and separating-vessels placed in series. The acid was added partly to the pulp at the head and partly to the suction of the various agitators. These agitators and separating-vessels will not be described here, as they are the same as those used in our present treatment, which will be described later.

The difficulty of marketing these mixed lead-zinc concentrates spurred the officers of the metallurgical department to find a better way of treating the slime, so as to get a zinc-concentrate practically free of lead and a lead-concentrate practically free of zinc. That the galena was much more readily oxidized than the blende was well known. In fact, the high lead content of the tailing produced by floating the sulphides from the slime was due to the oxidation of the galena during milling and subsequent exposure on the dumps.

In 1908, E. J. Horwood proposed that this property of lead sulphide be utilized in separating lead and zinc sulphides in slime, and in this connection a considerable amount of experimental work was done by the metallurgical staff, with the object of finding a commercial method of bringing about this oxidation. These experiments were finally successful, and led to the patenting in October 1908 of the Horwood process, the pioneer selective flotation process. This process is for the recovery of blende by flotation from ores containing blende, galena, and (or) pyrite. This is accomplished as indicated above, by oxidizing the galena and (or) pyrite and so rendering them unamenable to flotation while the blende, not being attacked, is floatable.

The most suitable way of bringing about this oxidation was found to be by roasting the slime or the mixed concentrate at a temperature of 400°C. and rabbling freely with a plentiful supply of air. If the ore to be treated contains soluble salts these should be removed by washing, as otherwise they will cause the blende to be attacked; this will cause loss of zinc, owing to solution and high acid consumption.

Oxidizing the lead in the wet way was also patented by Mr. Horwood, but when oxdizing agents are used the zinc is invariably attacked, although, of course, not to the same extent as the lead. The more rapid the action of these reagents on the galena, the greater the amount of blende dissolved, and only by making the oxidizing solutions weak is this trouble overcome, but then the time required to sulphatize the lead becomes excessive.

It was found that, with Broken Hill and like ores, the best temperature at which to sulphatize was 400°C. At this temperature the galena sulphatizes rapidly, while the blende is not affected. In the case of ores other than those of Broken Hill, carrying a large amount of pyrite, as well as zinc and lead sulphides, the temperature can nearly always be safely carried to 500°C., especially while the pyrite is burning. Little or no lead sulphate will be formed while pyrite is present, so this is burnt off rapidly.

Ores containing resinous blende invariably stand a higher temperature than those in which the blende is ferruginous. The sulphating operation requires plenty of air, and a good draught over the ore in the furnace is essential. While the sulphur is being burnt from the

pyrite, the ore will tend to flow somewhat, but as soon as the galena starts to oxidize the particles seem to cling together, and very little dusting occurs.

The extent to which the sulphating has to be carried to prevent the lead from floating varies with different ores. In some cases a 10% sulphatization is sufficient, while in others as much as 60 or 70% is required.

The subsequent flotation of the blende in the roasted ore is a simple matter, provided, of course, the temperature has been kept within the limit mentioned, and the soluble salt content of the ore treated was low. A slightly acidulated solution at a temperature of 130°F. has nearly always been found to give the best results.*

If no oil is used, the solution should be high in soluble salts, and should carry from 1 to 3% of sodium sulphate. The sodium sulphate acts as a mineral-frothing agent, and its use was covered by Patents No. 10640/13 in the Commonwealth of Australia by Mr. Bradford. A large number of tests have been made on a great variety of ores, and the process has been proved to have a wide application. In order to make tests on a working-scale, a small flotation plant was provided by the Broken Hill Proprietary Co. at the Bendigo School of Mines, where the requisite roasting-plant was already available. Working-tests were carried out to demonstrate the practicability of the process on both Broken Hill slimes and Tasmanian complex sulphides, from which latter a zinc-concentrate assaying over 58% lead was obtained.

Owing to the litigation between the rival claimants to the oil-flotation processes, which were then considered necessary for slime-flotation, the Horwood process was not used at the Proprietary mine, but was adopted by the Zinc Corporation, on whose property a plant to treat 70 tons per day of a mixed lead-zinc slime-concentrate was erected. The plant was working for about 12 months, but operations were suspended on the outbreak of war, as there was no sale for the concentrate produced.

The roasting was carried out in an Edwards duplex furnace of 12 panels, and this was found to answer well for the sulphatizing operation. The float was produced in a Minerals Separation machine of the staggered type, using eucalyptus oil as the frothing-agent.†

By the time litigation between the oil-flotation claimants ceased in Australia, Mr. Bradford and I, working together, had obtained encouraging results experimentally in preferential flotation without roasting, indicating the advisability of awaiting further developments before installing any selective process for the treatment of slime.

Before proceeding to describe the other methods of preferential flotation developed at our mine, a short account of the theory of flotation, as held by those engaged on the work, may prove useful to the reader. The old theory that flotation was due to the aversion of the sulphide particles to becoming wetted and that they were always surrounded under normal conditions with a film of air, is the one generally accepted here. Whether this aversion on the part of the sulphides is caused by electric charges, as first advanced by Professor Huntington in his evidence before the Royal Commission on the Potter-Delprat process in 1904, or not, has never been determined, for, in fact, it has always been looked upon as a natural property of sulphides. From a purely scientific point of view, it would undoubtedly be interesting to know why sulphides have this property, but from a practical point of view the fact that they have this property is self-sufficient. For the average man running a flotation plant, the simpler the theory the better. It is no good going to such depths that he cannot grasp the meaning, for then instead of being a help the theory only confuses him.

From the above old theory two main ideas attracted those who were engaged in experimental work on preferential flotation: (1) Since all sulphides have an aversion to becoming wetted, whereas oxidized minerals have not, or have not in the same degree, then a separation of one kind of sulphide from another kind of sulphide might be brought about by changing one of them to an oxidized state. This was done by the Horwood process. (2) Since the sulphide particle floated by aid of the film of air that surrounds it, then by removing this film the particles will become wetted and will not float.

The problem of bringing about this removal of the film was solved by Mr. Bradford in 1912, and again in 1913. His first method was by treating the ore containing galena and blende with a slightly acidulated sodium-chloride solution. This solution, especially at a temperature of 140°F. and above, has a slight chemical action on the galena. This chemical reaction generates H_2S, which diffuses in the air films around the galena particles and gradually removes them. The rate at which the H_2S is generated gradually decreases as the solution becomes less acid, and finally reaches a point at which it is not generated as fast as it goes into solution. When this stage is reached, the galena is wetted by the solution coming into intimate contact with the surface of the particles. Now by agitating the ore in this solution, the blende will float, but the galena will not. The acidity of the brine solution must be low, otherwise the H_2S will be generated faster than it can go into solution, and in that case the galena will not be wetted and will float with the blende.

This is known as the Bradford salt-sulphuric process. It has never been worked on a large scale, because by the time it had been developed sufficiently to be put to commercial use, Mr. Bradford had discovered another way of obtaining the results without the use of the brine solution.

The strength of the brine solution varies with the different ores under treatment, but from 5 to 10% NaCl will be found sufficient in most cases. The acidity must be kept low and should not exceed 0.03% H_2SO_4. A trace is nearly always sufficient. It is not always necessary to keep the solution acid throughout the separation.

*Details of this process appeared in the Transactions of the Australian Institute of Mining Engineers, Vol. 16, for 1912.

†A full description of this plant and its application is to be found in the Proceedings of the Australian Institute of Mining Engineers, No. 12, of 1913.

At the start it should be slightly acid, but this acidity will disappear before the separation has proceeded far, and it is then completed in the neutral solution. The temperature of the solution should be between 140 and 160° F.

Having removed the blende in this way, it may be necessary to concentrate the lead remaining in the residue before sending it to the smelter. This may be done in two ways: (1) By adding a small amount of a soluble copper salt to the brine solution, causing any sulphides remaining in the residue to float when submitted to aeration. (2) By removing the residue from the brine circuit and floating the lead in warm acidulated water.

The use of copper sulphate in assisting the flotation of sulphides was discovered by Mr. Bradford, and patented by him in 1913, Commonwealth Patent No. 8123/13. It was also covered for the same purpose by the Minerals Separation people in 1914, but Bradford's patent is recognized here in Australia. He did not cover its use outside the Commonwealth.

A practically complete separation of the lead and zinc sulphides can be made by the salt-sulphuric acid method giving a lead-concentrate of 65% lead and a zinc-concentrate of 50% zinc.

The following laboratory tests illustrate the capabilities of the process on Broken Hill crude ore:

No. 1

	Weight, %	Zinc, %	Lead, %	Silver, oz.
Original	...	12.4	15.5	11.5
Zinc-concentrate	20.9	50.6	3.5	11.2
Lead-concentrate	18.6	6.4	69.8	39.5
Tailing	57.8	1.0	0.6	1.6

The distribution of metals is as follows:

	Weight, %	Zinc, %	Lead, %	Silver, oz.
In zinc-concentrate	20.9	85.3	4.7	20.3
In lead-concentrate	18.6	9.6	83.8	63.9
In tailing	57.8	4.6	2.2	8.0
		99.5	90.7	92.2

No. 2

	Weight, %	Zinc, %	Lead, %	Silver, oz.
Original	...	15.8	16.0	12.9
Zinc-concentrate	25.0	52.0	2.7	5.6
Lead-concentrate	20.75	9.6	65.2	50.0
Tailing	52.5	1.2	2.7	1.6

The distribution of metals is as follows:

	Weight, %	Zinc, %	Lead, %	Silver, oz.
In zinc-concentrate	25.0	82.3	4.2	10.8
In lead-concentrate	20.75	12.6	84.5	80.8
In tailing	52.5	4.0	8.8	6.5
		98.9	97.5	97.7

The second method of removing the air films from the sulphide particles was discovered by Mr. Bradford in 1913, and patented. This was brought about by either causing a soluble gas to be generated in the ore-pulp under treatment, or by forcing it in under pressure. The gas, by diffusing in the air film surrounding the sulphides, causes the film to be removed, and then, being itself soluble, allows the solution to come into intimate contact with the surfaces, and so wets them. The soluble gas used is SO_2 and this is either generated in the pulp by adding hyposulphite (or any other reagent that will liberate SO_2) and sulphuric acid, or by blowing SO_2 gas produced from roasting operations, or by burning sulphur into the pulp while it is being stirred. In some cases both these methods are used together. If the pulp, after being treated in this manner, is subjected to agitation with air, then those particles that have a greater aversion to being wetted will take the air and float, while those that have not such an aversion to being in this state will remain with the gangue.

This process has been in use on a large scale by the Broken Hill Proprietary Co. and also by the Broken Hill Junction North Co. for some time, and excellent results are being obtained. The process is now being adopted by several other Broken Hill companies, which have purchased the Broken Hill rights from Mr. Bradford. The complex sulphide ores from the Rosebery-Hercules mines, in Tasmania, containing blende, galena, and pyrite, gave a zinc concentrate containing up to 58% zinc, with recoveries from 80 to 85%.

The following laboratory test illustrates the work done by the process on Broken Hill slime:

	Weight, %	Zinc, %	Lead, %	Silver, oz.
Original	...	13.9	7.4	6.8
Lead-concentrate	12.9	8.7	43.4	41.8
Zinc-concentrate	21.4	50.7	4.0	3.4
Tailing	63.2	2.4	1.5	1.1

The distribution of metals is as follows:

	Weight, %	Zinc, %	Lead, %	Silver, %
In lead-concentrate	12.9	8.1	75.6	79.3
In zinc-concentrate	21.4	78.0	11.5	10.7
In tailing	63.2	10.9	12.8	10.2

A description of this process will form the subject of a separate paper.

EXPORTATION OF SILVER. The melting down of the silver dollars in the United States Treasury and the exportation of the bar silver resulting and other silver bullion possess great interest to the average American citizen. Most of this silver bullion is sent to India, whose people have a strong prejudice in favor of metal money, and India is exporting a vast amount of material used in the War by England and France, and, in fact, all the entente allies, including ourselves. To pay for these goods in the money desired by the people of India caused a tremendous drain on the supply of silver of entente allies, and to meet this urgent demand the United States has taken the great amount of silver bullion and silver dollars lying idle in its Treasury and is exporting it to India to be used in paying for war supplies. Something like a hundred million silver dollars have been melted down and exported. What great assistance it was to the allies, including the United States, is shown by the statement of Sir James Meston, financial member of the Viceroy's Council, who is reported as saying: "Probably few people in America realize how vitally important to India and to India's share in the War was the legislation passed in Washington releasing large quantities of silver for use in alleviating the currency situation there. For this action India as well as the British Empire and the allies owe a debt of gratitude to the United States which it is hard to overstate."

Lead Salts in Cyanidation

By THOMAS B. STEVENS

*Most cyanide solutions require the addition of varying quantities of lead salts to correct the effect of soluble sulphides. Lead is also required to form a zinc-lead couple in the zinc-boxes so as to aid precipitation.

Prior to the outbreak of war, acetate of lead, which is the most common soluble lead salt, was almost universally used for these purposes. The only notable exception was at the cyanide plant of the Homestake company in South Dakota, where nitrate of lead was used. With the shortage of European supplies of acetic acid, lead acetate could only be obtained from the United States. The latest London quotation is £145 per ton (31 cents per lb.), compared with a pre-war price of about £30. The price in America is 15c. per pound. The price of lead nitrate does not show such a large advance, the present price being £65 per ton (14 cents per lb.). This is due to many large plants having been erected in England for the manufacture of nitric acid. Lead nitrate has never been a common commercial salt to the same extent as the acetate.

Lead acetate is prepared by dissolving oxide of lead (litharge) in crude acetic acid. The chief source of acetic acid is from the distillation of wood. This was an important German industry. Not only has the War cut Australia off from supplies of this acid, but at the same time the demand for it has increased. Acetone is a derivative of acetic acids, being prepared by the dry distillation of calcium acetate. It is largely used in the manufacture of cordite, a most important munition. Acetone is at present unprocurable in Australia.

The scarcity of lead acetate has caused metallurgists to direct more care to the use of other salts of lead. Litharge is an Australian product, being made at the works of the Broken Hill Associated Smelters at Port Pirie, South Australia. It is an insoluble salt, but it may be dissolved in either caustic alkalies or acids. Caustic alkalies dissolve it to form plumbites ($CaPbO_2$) and an admixture of slaked lime and litharge has been largely used to precipitate soluble sulphides from working cyanide solutions. It is probable that the protective alkali usually present in cyanide solutions is in itself sufficient to cause finely-ground litharge to act as a precipitant of soluble sulphides. At some mines an economy is affected by feeding used cupels from the assay-office into the tube-mills, or other parts of the grinding-plant; but at mills where concentration is practised, the litharge must be thoroughly dissolved before introduction into the plant circuit, as the concentrating tables will separate it out owing to its high specific gravity.

*Abstract from 'Monthly Journal' of Chamber of Mines of Western Australia.

For the formation of the zinc-lead couple in zinc-boxes, solutions of lead in the form of plumbites are useless, as the lead is contained in the positive radical and cannot be replaced by zinc. This may be readily proved in the laboratory by dissolving a little litharge in boiling caustic soda, and then immersing zinc shaving in the solution, when no deposition of spongy lead will take place. At the present time for coating zinc shaving, litharge is usually dissolved in nitric acid just prior to use. This is cheaper than purchasing lead acetate. Lead nitrate in crystalline form is unprocurable except by purchase at a high price from the Cape Explosives Works in South Africa. The reaction for dissolving litharge in nitric acid is easy to perfom and requires no heat, so that the use of a steam-jacketed pan such as is required when metallic lead is dissolved, is avoided. An earthenware jar to hold five gallons is all the apparatus required. To make 10 lb. of nitrate, 7 lb. of litharge ground to as fine a powder as possible, is added gradually to 1603 cc. of 70% (sp. gr. 1.41) nitric acid, which has previously been diluted with 6500 cc. of water. The whole is stirred with a wooden stick for 10 minutes. The weights and measures in this form are those usually most easily available at cyanide plants. The reaction causes the solution to get moderately warm to the hand, and when it is completed any undissolved excess of litharge will readily settle to the bottom. The solution of lead nitrate that will be neutral to litmus can be decanted off readily. It is advisable to work with a slight excess of litharge, as it can be left in the bottom of the jar to form part of the next charge; by this means the full strength of the nitric acid is utilized. It is also important to dilute the acid with water as directed, before the addition of the litharge, otherwise some insoluble basic lead nitrate is likely to be formed. To make 100 lb. of lead nitrate, 67.4 lb. of litharge and 38.1 lb. (100%) of nitric acid are required. The present price of 70% nitric acid in jars at Kalgoorlie is £80 per ton, corresponding with £114 for 100% acid. The price of litharge at the same place is £58. The cost of making a ton of lead nitrate is £82.5, being £39.1 for litharge and £43.4 for nitric acid. Efforts to get the nitrate made at the works where the acid is produced, and to save the high freight on the acid, as done in South Africa, have failed. The small amount of nitrate consumed by our mills does not make it worth while for the acid manufacturer to install the necessary plant. Lead nitrate—$Pb(NO_3)_2$—contains 62.5% of lead, compared with 54.6% in the acetate—$Pb(C_2H_3O_2)_2 \cdot 3H_2O$—and as it is the lead content only which is of use, in round figures 9 lb. of the nitrate is as valuable as 10 lb. of the acetate.

Rotterdam, the Distributing Centre for the C. R. B.

By WALTER LYMAN BROWN

Rotterdam, in Holland, has been, since October 1914, the date of the fall of Antwerp, the only port of entry for Belgium, and so was, of necessity, chosen by Herbert Hoover, as the centre of entry and distribution when he organized the Commission for Relief in Belgium. Hoover (the 'Big Chief'), W. L. Honnold, the present director at New York, Edgar Rickard, and Millard Shaler, who have been with the C. R. B. from the beginning and who helped to start this office, besides two of the assistant-directors here and the writer (the present director), are all mining engineers. Moreover, W. B. Poland, the director in London, and the two early directors in Rotterdam are also engineers; thus the organization has consisted largely of members of our profession.

The Commission supplies practically all the food of Belgium and 'occupied,' or invaded, France. The population thus served consists of 9¼ million, divided roughly into 2 million French and 7¼ million Belgians. Belgium is again divided into the General Government and the Ettappes of the 4th German Army, which occupies East and West Flanders, the populations being relatively about 5½ and 1¾ million. Rotterdam is therefore the connecting link between the outside world and the invaded territories.

Supplies originate principally in the United States, nearly 80% of our purchases coming from there; however, large quantities of maize and wheat are shipped from the Argentine; coffee, rice, peas, beans, soap, and clothing have come until recently from England; later, increased quantities of foodstuffs have been purchased in Holland. But from whatever source, all supplies converge here and are in turn distributed to the various destinations in accordance with the adopted program and the respective needs of the provinces and districts of Belgium and France.

The principal method of shipment is by canal, with which Holland, Belgium, and Northern France are well served; the gateways, going from west to east, are Ghent, Antwerp, and Liège, the principal one being Antwerp. It is the excellent canal system of these countries that has permitted distribution to be carried out, not only at a reasonable cost but at any price, as under the pressure of war, with its huge demands on and wastage of rolling-stock, it would have been utterly impossible to ship the C. R. B. supplies by rail. The canals and locks are of all sizes, big lighters of 2000 tons capacity being used to Antwerp and Ghent, whereas Northern France, Hainaut, and Namur can only be reached with small 38-metre boats of 270 tons.

The shipments into Belgium and Northern France for the first three years were as follows:

Year	Metric tons
1915	951,005
1916	1,281,569
1917	789,098

and a further quantity of 600,000 tons has been dispatched up to June of the current year.

These shipments are confined to a few articles only, and these of the highest calorific value at the price. Our finances had to be hoarded just as carefully as the working-capital of the small mine that we all know. Wheat is the principal foodstuff, and it was early established that it was better to import whole grains to be milled in the country, with the consequent labor for the people and the yield of by-products for cattle-fodder, than to ship flour. Wheat accounts for 62% of the whole, bacon and

GERMAN MAP SHOWING LIMITS OF BLOCKADED AREA ON FEBRUARY 1, 1917

lard 5%, maize 10%, rice, peas, and beans 10%, leaving only 13% for sundries.

Every shipment into and out of Rotterdam has a number affixed to it, and is known to history and the swearing Chief Statistician by that number. This applies equally to the gift of a Dutch cheese, a 10,000-ton cargo of wheat ex the 'New Amsterdam,' or a present of a barrel of candy from the children of Berkeley to the children of Louvain. On June 1, 1918, arrival No. 2206 had been recorded, lighter shipment No. 9033 had gone forward, and rail shipment No. 5711 had been dispatched.

Sixty destinations are served from Rotterdam, the longest haul being 334 kilometres to Charleroi, and the shortest 141 km. to Antwerp. The average is about 145 miles and the total cost of freight and towage averages one Dutch cent or two-fifths of one American cent per metric ton-mile.

The equipment can be divided into incoming (overseas), discharging, and outgoing (canal transport). Our overseas fleet consists of, firstly, Belgian steamers of approximately 125,000 tons carrying capacity. These are supplemented by five small American vessels of the Wagner fleet and one French ship, all the above being on time-charter for practically continuous service. This does not meet half the needs, which are about 325,000 tons in all, and so neutral trip-charters have to be secured to make up the balance. Norwegians have furnished most of this tonnage, and here I would like to add a word of appreciation of the Norwegian sailors who have kept the seas against all odds, and have helped not only the C. R. B. but the whole Allied cause more than any other neutral nation. Lately, however, Swedish vessels have taken our charters in considerable numbers and a few Dutch have periodically been in our service. All these ships sail under special markings and safe-conduct passes, photographs of which are attached. They must follow special routes outside the danger zone as proclaimed by the German government. On the whole, these passes have been fairly well treated by the Germans, though there have been a number of cases of torpedoing during the three and a half years that they have been in operation, and there has been lately one case of confiscation before the Prize Court.

About a year after the beginning of the Commission, four grain-elevators belonging to the city of Antwerp, but lying in Holland, were taken over by us and with these most of the bulk grain (wheat and maize) has been discharged. Working with these elevators, all records of the port of Rotterdam for quick dispatch have been broken, and as Rotterdam is probably the best equipped port, this may constitute a world's record. Herewith I quote a few instances of rapid discharge:

Steamer	Cargo	Material	Discharged in hours
Sagama River	7120	Wheat	17¼
Photinia	7386	"	17
Grangesburg	9641	"	20
Pontoporos	6000	Bacon and lard	76

All cargoes of bulk grain are handled directly by the C. R. B., general cargo being discharged by stevedores on contract at about 30 cents U. S. per ton. Our own grain-elevator discharge, of course, is much cheaper, averaging only about 12c. per ton. Most cargoes are transhipped directly into lighters for forwarding to the Occupied Territories, though a small amount is usually sent by rail to the Liège district, and sometimes considerable quantities are placed in storage awaiting the various Government permits for shipment.

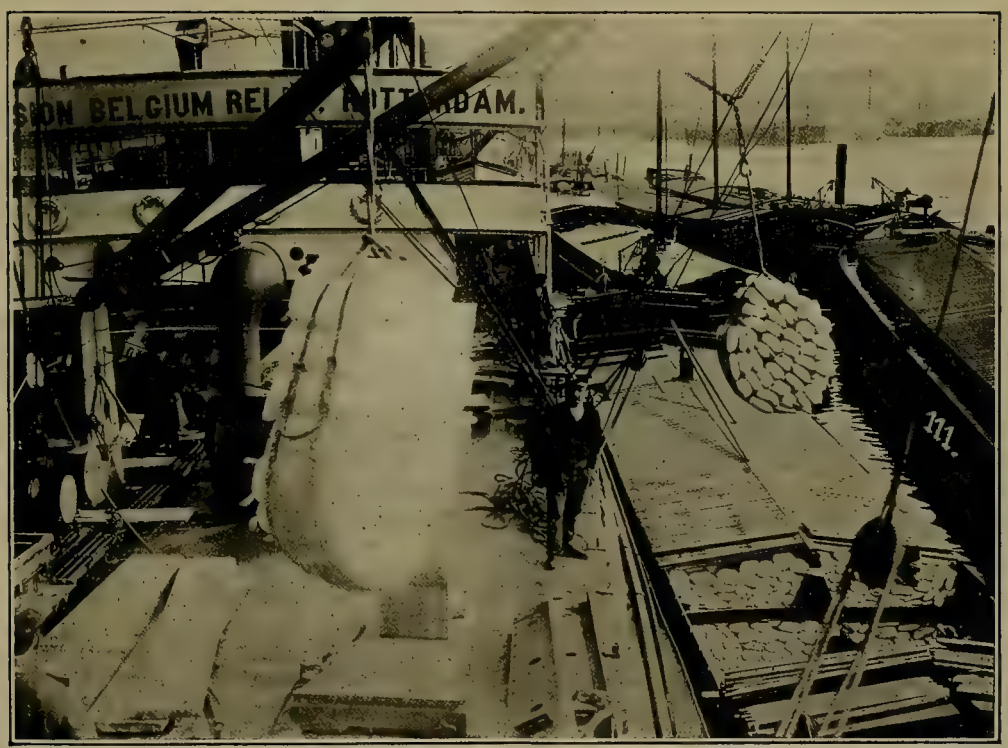
The formalities to be gone through to get a lighter into Belgium are numerous. German passes for the crews have to be secured, and to these are attached photographs showing everyone, from the skipper and his wife to the inevitable dog, and as the Germans latterly have insisted on having all on one picture, the difficulties of the photographer in getting them together can well be imagined. Belgian skippers do not believe in 'race-suicide'; one often sees a family of ten and the crew living in the two or three little rooms that serve as accommodations. For each shipment a special German permit has also to be given authorizing the German frontier-posts to pass the cargo. The Dutch formalities are no less strict. All cargo is discharged from overseas and re-loaded for Belgium under severe customs control, to prevent smuggling, which is a very remunerative trade, owing to the exorbitant prices that all 'free' foodstuffs command, both in Holland and Belgium. The least infraction on the lighterman's part causes trouble and delay, and the complete discharging and re-loading of cargoes at Hansweert, the last Dutch border-station, is often ordered. To one without the experience it is impossible to believe the amount of red tape and delay that can be crowded into a country as small as Holland.

Here, however, I want to state that the Dutch have an extremely difficult problem in the smuggling question, as Germany welcomes it with open arms and huge prices are paid for all contraband. Holland is doing its best to cope with it and is succeeding as well, probably, as any other country could. Also, the Dutch government has always given the C. R. B. every assistance in its power, smoothing away all possible difficulties, and helping us with large concessions, both financially and otherwise.

The ingenuity displayed by lightermen to circumvent the laws is worthy of a better cause, and would go a long way toward winning the War if applied along proper channels. Theft, as well as smuggling, has to be combatted, and a special Control Department has just been organized to attend to this trouble. This department inspects all lighters before, during, and after loading, in close co-operation with the customs officers, checks the sealing of the boats, controls weights, and, in fact, all operations in connection with the cargo; it has special watchmen along the canals, and convoys fleets of lighters to the frontiers to prevent theft en route.

That this control is effective is shown by the fact that the total losses on shipments between Rotterdam and the Belgian and French destinations have averaged only 15 hundredths of 1%, careful weighing and tallying taking place at both ends. Included in this difference is the usual natural loss of weight in shipment, this being especially marked in maize and bacon, thus leaving only a small margin for theft and fraud. This figure is con-

C. R. B. FLOATING ELEVATORS AT WORK



DISCHARGING FLOUR FROM STEAMER TO LIGHTER

siderably better than that accepted as normal by European shippers before the War, and under the present difficult circumstances must be considered remarkable.

As before said, lighters and tugs are used for the internal transport. As in the case of overseas tonnage, the basic lighter fleet consists of about 300 time-chartered Belgian boats to supplement which trip-charters are made as required. Most of this fleet was in Belgium at the time of the German occupation, and over this the German claim jurisdiction. The date from which this jurisdiction should count has been the subject of long negotiation, the Germans first holding to the date of the fall of Antwerp, but we finally secured an extension to December 17, 1915, all boats in Holland before that date to be 'free' and those in Belgium to be 'controlled'. For 'controlled' lighters a 'caution' has to be paid, to cover which we have put up a blanket-bail of 100,000 marks, to ensure that they return to Belgium. 'Free' lighters travel without caution, on a pass, which covers both the inward and outward trips.

The Germans are under guarantee not to interfere with our necessary transportation equipment, but as their needs from military transport increase so our problem grows more difficult. They continually press for the release of our boats and we as continually resist under the guarantees.

Tugs pull the lighters and a fleet of about 45 is kept for this purpose. This is sharply divided into those for internal use, numbering about 25, and those that work only in Holland, from 15 to 20. At first, Belgian tugs were principally used, but later, as certain of these had to be given up to the Germans and as the work increased, it became necessary to charter Dutch tugs and several were also purchased. In order to use Dutch tugs in Belgium, guarantees, to the satisfaction of the Dutch government against requisition by the Germans, had to be secured, as well as special permission to allow them to leave Holland.

From the first, the principle of the C. R. B. distribution has been 'Feed the people! Do it as cheaply as possible, but above all, keep the food moving.' That this policy has not been unsuccessful is shown by the fact that the daily bread-ration has never failed to reach the most remote village in Belgium or France, though it has been touch and go many times. Twice famine was averted only by generous loans of wheat by the Dutch government. At times, the rations have had to be reduced from their already pitifully low basis, owing principally to the sinking of vessels by submarines or mines, and especially to the great delay and loss of ships at the beginning of the sharpened submarine warfare in February 1917; but always the food available has been equally distributed to all, rich and poor alike, to Brussels, Bruges, or St. Mihiel, and often within range of the guns along the front line. Our delegates in France and Flanders have been shelled by French artillery and bombed by British air-men while visiting the villages near the front.

One of the many difficulties to be faced appeared first in the winter of 1916-'17. This was the freezing of the whole canal system of Holland, Belgium, and France. The possibility of this had been foreseen and at a meeting between the German military Eisenbahn Direktion, the Dutch State Railways, and the C. R. B., held at Esschen, on the Dutch-Belgian frontier, it had been agreed that the Germans would supply 300 fifteen-ton trucks daily, that the Dutch government would supply locomotives and free haulage to the frontier, and that the C. R. B. would guarantee to load the above trucks daily, allowing no demurrage to accrue.

The freeze came with little warning and as the lighters had to be dispatched up to the last possible moment, it was necessary to change over-night from a smoothly running system of water transportation to shipment by rail. Bulk wheat from America was the principal cargo to be handled and the Dutch practice was to bag the grain before shipping by rail. All the Rotterdam bagging stations were working for the Dutch government, which was also in difficulties. So the first day a thousand men were started bagging by hand, but by the afternoon it was apparent that this would not meet requirements; to load loose in the cars was the only solution. We were told that it could not be done, and, on asking why, the answer was, "Because it has never been done in Holland." However, on the second day, all the elevators were discharging from lighter or steamer directly into the railway-trucks and on the third day Brussels was being sworn at for not sending along the empties fast enough, as we were waiting for them.

The question was further complicated by the fact that the submarine blockade had just been declared and there were practically no arrivals of steamers from overseas. So the reserve stocks in storage-lighters at the Waalhaven (the big storage basin of Rotterdam) had to be broken out of the ice. This was, in places, a metre thick, so that ice-breakers on powerful tugs were used until several of them were badly damaged, and finally, men with saws and axes had to cut them out and bring them to the loading-points. Also, just at this time, the Germans were withdrawing to the Hindenburg line, and needed rolling stock as badly as we did, though for quite another purpose. However, the food was moved to all destinations, 3213 trucks being loaded with 46,480 tons of wheat and general cargo during the 18 days devoted to this work.

Not the least interesting phase of the C. R. B. work has been the negotiation with the Germans. In January 1917, just before the United States severed diplomatic relations, the German military had been pressing us to stop chartering lighters and tugs, and even to give up 100 lighters already on time-charter, as they had great need of shipping room, also apparently for the retreat to the Hindenburg line. A conference was arranged in Brussels and three of us sat facing what appeared to be the whole staff of a German army corps, from the General down, and all wearing the Iron Cross. There was only one thing to do: sit tight on the guarantees, that our necessary transportation facilities would not be interfered with. We sat and they talked for nearly two hours, but the net result was that we kept our fleet.

Negotiations over safe-conduct passes are, like the poor, always with us, and have finally resulted in arrangements whereby passes can be issued by the Swiss minister at Washington (representing German interests) for all cargoes from North America, the Swiss minister in Rio de Janeiro and the German minister in Buenos Aires for South America, and the German consul at Las Palmas for cargoes bought afloat and calling at that port. During the last few weeks this has been extended to include Bergen, in Norway, also for cargoes bought afloat, and negotiations are still pending to cover other points. Return passes to America or to the first port of call (not including the prohibited zones), good only if traveling in ballast, are all issued by the German legation at The Hague. These safe-conducts are given for all C. R. B. overseas cargoes and provide that, subject to our goods only beng carried, full Commission markings being flown and the vessel remaining outside the danger-zone, no attack or seizure shall be made by German naval forces. On the whole, these passes have worked fairly satisfactorily, though there have been certain "regrettable incidents."

THE 'HOOVER,' SPEEDY AND RELIABLE, AS USED ON AN INSPECTION MADE BY THE FRENCH AND AMERICAN MINISTERS

C. R. B. STEAMER, SHOWING SIDE BANNERS, SIGNAL BALLS, AND PENNANTS

The German blockade brought up another question, that of bunker-coal. For the first two and a half years all vessels had called at English ports for bunkers and inspection, but after February 1, 1917, they could only

do so without a safe-conduct pass and at the risk of being torpedoed on sight. This cut off the coal supply, as Holland has no mines able to yield coal of quality, but relies entirely on imports, which, in these days, are principally noted for their absence. So it was made clear that Germany must make up the deficit, as her action had cut off English supplies. Arrangements were made with Brussels whereby German bunkers would be supplied against Belgian coal from Mons and Charleroi to be transported to Holland by the C. R. B. This, in a few months, proved to be impracticable owing to insufficient Belgian coal being available and to the increased shortage in Holland, so new arrangements were made at The Hague in July 1917, whereby the Commission would be treated by Germany as a separate neutral State and rationed according to its requirements, which were estimated at about 15,000 tons monthly. This arrangement still continues, with, on the whole, fairly good results, though the price paid is from three to four times the pre-war figure.

The submarine blockade has made more trouble for this office. Many ships having been sunk and the sailings of others having been interrupted, imports fell to a low figure. Therefore it was decided to purchase the maximum quantity of Dutch-grown foodstuffs. This was a most complicated matter. All the exports from Holland were regulated by agreements made with England on the one hand and with Germany on the other. These agreements specified exactly what proportion of various articles could be sent 'overseas' and 'overland', that is, to England and France or to Germany. England agreed that all the C. R. B. purchases should count as a part of the so-called E. F. portion, but in each case, British permission to buy had first to be secured. Germany, who controlled the frontier, would only allow Dutch foodstuffs to enter Belgium under special permits, granted for individual shipments only, for she looked with jealous eyes on our purchases as leaving so much less for the 'Vaterland'. Holland was tied by her agreements with both belligerents and by the exigencies of feeding her own people. So every purchase memorandum had to be submitted to three governments for their approval, and just as, after strenuous endeavors, 2000 tons of beef or 10,000 tons of potatoes had been found, and Lille had been promised a little variation in her starvation rations, one side or the other, but usually the German, would step on the deal and a new start would have to be made along a different tack.

A Purchasing Department, with its branches of inspectors and controllers, was organized, which, within a month, was buyng at the rate of from two to two and a half million dollars monthly. During the eight months that it was in full operation about 75,000 tons of Dutch foodstuffs were bought and shipped to Belgium and France, these varying from sauerkraut to sausages and from Edam cheese to eggs, and including fresh meat, fish, butter, jams, and vegetables. This proved to be of great assistance in helping to make up the shortage in regular imports, and almost equally in the moral effect of giving a little variety to people who had been merely existing for three years on the gray bread, rice, peas and beans, bacon, etc., of the usual program. The cost of handling was much greater per ton than for the imported foods, owing to having to collect the small parcels from all parts of the country, and also the purchase-cost per food-unit was higher, but it was well worth the extra expense. It is only to be regretted that Holland's own food shortage has caused this supply to be cut off for the last six months, and that there seems little likelihood of its again becoming available in appreciable quantity.

The cost of carrying out the operations of this office will probably be of interest, and therefore a summary of the first three years is given below:

Statement of Expenditure for the Three Years Ended October 31, 1917

Tonnage shipped to Belgium and Northern France 3,021,672

Expenditure not chargeable against Rotterdam office operating costs

	Florins
Purchase cost	41,396,984.55
Sea-freights	31,306,537.79
Bank interest (credit)	66,453.05
Exchange	4,058.62

Operating Cost

		— Cost per ton —	
Shipping expenses		Florins	Dollars
Beyond freights	4,423,838.37	1.463	0.5852
Transhipping	1,355,318.57	0.448	0.1792
Extra transhipping (including control and inspection)	809,333.25	0.268	0.1072
Clothing and lace department expenses	116,122.70	0.039	0.0156
Storage and warehouse	278,748.56	0.093	0.0372
Bags and tarpaulins	49,496.03	0.017	0.0068
Harbor expenses	34,088.28	0.010	0.0040
Total	7,066,945.76	2.338	0.9352
Office and General Expenses			
Salaries	312,281.90	0.103	0.0412
Traveling expenses	86,458.70	0.029	0.0116
Telegrams, telephones, postage	25,284.57	0.008	0.0032
Stationery and printing	15,485.34	0.005	0.0020
Rent, taxes, and insurance	11,338.31	0.004	0.0016
War-risk and marine insurance	9,054.72	0.003	0.0012
Lighting and heating	7,870.73	0.002	0.0008
House-keeping expenses	9,860.20	0.003	0.0012
Auto expenses	11,168.82	0.004	0.0016
Sundry expenses	40,357.33	0.014	0.0056
Branch-office expenses	24,365.26	0.008	0.0032
Total	553,525.68	0.183	0.0732
Total operating expenses	7,620,471.64	2.521	1.0084
Grand total	80,261,599.50	= $32,104,639.82	

The tons are metric of 1000 kilo., and florins are converted at the pre-war rate of Fl. 2.50 = 1 dollar.

These costs, which cover all operations from the time that a steamer enters Rotterdam till the foodstuffs are delivered to the mills or warehouses of Belgium and France, while already low, include various items that do not strictly belong to operating expenses. The working of the rented elevators is much cheaper than the current rates of the port, but Transhipping Charges have always been debited with the Port Tariff, the savings being credited to London for the Benevolent Fund. The same applies to the extra expenses incurred in rushing the discharge of steamers on demurrage, or for which 'dispatch clauses' have been secured in the charters. Large sums have been saved or earned in this manner, but these are credited to 'Sea-Freights' at London, the costs being charged here.

Clothing and Lace Department expenses are also extras, although they present one of the most interesting phases of our work. The lace is Belgian, made by about 50,000 women, to whom, through a wonderfully fine organization of ladies in Brussels, the C. R. B. supplies the necessary thread and markets their product.

Topography From Moving Objects

By A. J. SALE

It seems unfortunate that, since the present war had to come, it did not come ten or twenty years sooner, when the 'frontier engineer' was in his prime. By the 'frontier engineer' I mean the sort of man that entered the mining camps of the West before the advent of the railroads and had to adjust himself to the most adverse conditions. Many of these men have had to improvise a surveying instrument by nailing two sticks together; to run levels by tying a rock to a carpenter's square; to titrate assays on a spot-plate made from the top of a casserole; to weigh assay buttons with weights made of tissue paper; in short, to adjust themselves to an infinite number of difficult conditions. Should Russia resume the offensive as our ally, her frontier problems will demand the old-time engineer, who will become of considerable military importance, irrespective of age or physical perfection. Examples of this kind of work are the following:

In Fig. 1 is shown an exaggerated instance of the development of a true straight-edge from a rough flat stick. Lay one side of the stick upon a paper and draw a line along its face; rotate around this line until the other side is against the paper, and draw another line along the face; now connect the consecutive points of contact by short straight lines, using a match or similar object for a small ruler. The result will be a perfectly straight line of any desired length; and if the stick be whittled exactly to fit this line, a practically perfect straight-edge will be obtained.

To construct a reasonably accurate engineer's scale requires that one apply a sort of Bertillon system to himself. Most of us have a fairly accurate idea of the length of our normal stride, the span between the tip of our thumb and little finger, and other personal constants; but these are not of sufficient accuracy for the construction of a scale. I find, for example, from several careful measurements, that my two lower canine teeth have sharp points which are exactly 1.17 inches apart. In Fig. 2, I show how I constructed an inch measure by biting into a piece of paper: AB represents the line between the centres of the original tooth-marks, or 1.17 in.; draw AC at random; on the edge of a piece of paper mark two sharp lines about a sixteenth of an inch apart; starting at A, copy off five of these divisions on the line AC toward C; on the edge of another piece of paper measure the length of these five divisions, and transfer it along AC from point 5, which will locate point 10; in a similar manner, locate point 20 from point 10; after this locate every 20 up to 120, which call point C; from the 120 point, measure back 3 of the small divisions for 117, which call point D; draw a straight line between B and D; from the 100 point E, draw a parallel to BC, using improvised straight-edges or direct measurement improvisations as desired; if F is where this parallel intersects AB, then $AF : AB = AE : AD = 100 : 117$; or $AF = 100/117 \times 1.17 = 1$ inch. This inch-measure can be subdivided as desired by completing the subdivisions on AD, and drawing additional parallels to BC. If the full number be used, the final subdivision will be 1/100 of an inch. After completing the inch measure, it can be transferred to as long a straight-edge as desired. I have constructed several rules by this method and find them to be remarkably accurate. Two file-marks on the thumb-nail will preserve a fixed measure for a limited time, but I do not consider this as accurate as the method described.

In Fig. 3 is explained the construction of a true 90° angle from a block of wood having two straight faces somewhere near perpendicular to each other. Lay one face against a straight line and draw a line along the other face; now rotate until the second face is against the original straight line; then draw a line along the first face; the bisection of the angle between the lines as drawn will be a true perpendicular to the original base line.

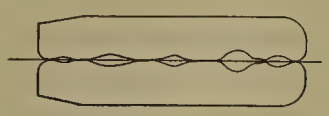


FIG. 1

FIG. 3

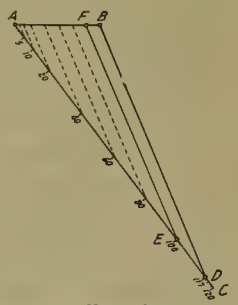

FIG. 2

To bisect an angle without implements, mark two fine lines along the edge of a straight piece of paper at any desired distance apart; transfer this distance to each side of the angle to be bisected, thus developing an isosceles triangle; on the edge of the same straight piece of paper, lay off a distance which is approximately half of the base of the isosceles triangle; transfer this distance to the base from each side; the result will be two points so close together that the intervening distance can be accurately bisected by the eye.

For a 60° angle, perforate a piece of paper or thin board with a pin at one end and with a sharp pencil point at the other. With this implement draw a circle and lay off the radius at some convenient place on the circumference, which will develop an equilateral 60° triangle. Bisecting the 60° angle, we obtain 30°, which

again can be subdivided to 15°, or smaller if desired. When sufficient triangles have been made, it would not prove a difficult task to construct a fairly accurate paper protractor.

Having prepared sufficient working-tools, the engineer is in a position to attempt the mapping of enemy territory. The moving object from which the topography is observed can be any ordinary conveyance, of which by far the best would be an aeroplane. The advantage of being in motion is the decrease in the chances of being hit by the enemy and the more rapid covering of territory by all conveyances except the aeroplane, which necessitates taking observations while in motion, even if it did not have the above advantages. To start this work the engineer will measure off a base line in a fairly safe position behind his own lines. If he has a transit, tape, level, and the other common accessories, this will not be a difficult task, but if he has nothing to work with he can keep the line straight by sighting over a rifle barrel, and use the other improvisations previously described. If transits are available, one man at each end of the base line might prove sufficient, as they can follow both the horizontal and vertical movement of the field observer at one sight, but if it is necessary to rely upon improvised graphic angles, a much larger crew will be required, as the observations must be made on the instant that the signal is given. If the field observers have a good compass and clinometer, two men should prove enough; if, however, they have to depend upon graphic angles, it would probably take at least three.

When everything is ready, the field observers will make a trip around the territory to be mapped, take photographs, or make sketches, and mark important points by numbers. I find that concentration of mind is as essential as good eye-sight for this type of work. Having completed the preliminary preparations, the field observers will start a circuit in front of one end of the field to be covered. They give the signal for No. 1, and at the same time they read the bearing (or mark the graphic angle) to point No. 1; also read the vertical (or mark the graphic) angle to the same point. This reading can conveniently be recorded as *A*, 1 horizontal and *A*, 1 vertical. At the instant of signal No. 1, each of the base-line observers reads the bearing (or marks the graphic angle) to the position occupied by the field observers; they also read the vertical (or mark the graphic) angle to the same position, which readings they record as *A*, 1 horizontal and *A*, 1 vertical. As soon as convenient, point No. 2 is observed in an identical manner, and is recorded as *A*, 2 horizontal and *A*, 2 vertical; and so on throughout the entire series. After making all of the '*A*' observations, the observers move to the other end of the field to be covered, and complete a set of '*B*' observations; after which it may be advisable to make another set of '*C*' observations, or even more, to check the more important enemy positions.

For this kind of work, the principal calculations involve the tangent function. In calculating traverses without tables the sine and cosine series can be developed by making $X = O$ in each successive differentiation. Applying the same principles, we can develop $\text{Tan } X = X + \frac{2}{3 \times 2 \times 1} X^3 + \frac{16}{5 \times 4 \times 3 \times 2 \times 1} X^5 + \text{———}$, which result can be obtained by algebraically dividing $\text{Sin } X = X - \frac{1}{3 \times 2 \times 1} X^3 + \frac{1}{5 \times 4 \times 3 \times 2 \times 1} X^5 - \text{———}$ by $\text{Cos } X = 1 - \frac{1}{2}X^2 + \frac{1}{4 \times 3 \times 2 \times 1} X^4 - \text{———}$.

We can demonstrate that, for an accuracy of one in ten thousand, $\text{Tan } X = X$ up to 1° 15′; the numerical value of X being 0.0002909 times the number of minutes. Between 1° 15′ and 3° 45′ add 0.0001 to the numeric value of X for the exact value of the tangent. Between 3° 45′ and 10° 30′ $\text{Tan } X = X + \frac{1}{3}X^3$; and between 10° 30′ and 14° 30′, $\text{Tan } X = X + \frac{1}{3}X^3 + 0.0001$. Beyond 15° this formula is not of much value. The formula $\text{Tan } X = \frac{\text{Sin } X}{\text{Cos } X}$ will always prove of service.

The next important formulas are $\text{Tan } (U + V) = \frac{\text{Sin } (U + V)}{\text{Cos } (U + V)} = \frac{\text{Sin } U \text{ Cos } V + \text{Cos } U \text{ Sin } V}{\text{Cos } U \text{ Cos } V - \text{Sin } U \text{ Sin } V} = \frac{\text{Tan } U + \text{Tan } V}{1 - \text{Tan } U \text{ Tan } V}$ and $\text{Tan } (U - V) = \frac{\text{Tan } U - \text{Tan } V}{1 + \text{Tan } U \text{ Tan } V}$.

From these formulas we can deduce $\text{Tan}(2U) = \frac{2 \text{ Tan } U}{1 - \text{Tan}^2 U}$; also $\text{Tan } (45° + U) = \frac{1 + \text{Tan } U}{1 - \text{Tan } U} = \frac{\text{Cos } U + \text{Sin } U}{\text{Cos } U - \text{Sin } U} = \sqrt{\frac{1 + \text{Sin } (2U)}{1 - \text{Sin } (2U)}}$, and $\text{Tan } (45° - U) = \frac{1 - \text{Tan } U}{1 + \text{Tan } U} = \frac{\text{Cos } U - \text{Sin } U}{\text{Cos } U + \text{Sin } U} = \sqrt{\frac{1 - \text{Sin } (2U)}{1 + \text{Sin } (2U)}}$. Finally, $\text{Tan } U = \frac{\text{Sin } U}{\text{Cos } U} = \frac{2 \text{ Sin } U \text{ Cos } U}{2 \text{ Cos}^2 U} = \frac{\text{Sin } (2U)}{1 + \text{Cos } (2U)}$, or $\text{Tan } (\frac{U}{2}) = \frac{\text{Sin } U}{1 + \text{Cos } U}$.

The choice of formula to be used will entirely depend upon circumstances; the minimum amount of work in calculation being the guide to selection.

As a working example of the application of the above formulas, assume that, from outside sources, the base-line has been determined to be S. 70° 30′ E., 6000 ft.; with a starting elevation of 2101 and a finishing elevation of 3320 feet.

The first base-line observer shows *A*, 1 horizontal, to be an angle whose altitude is 1.15 times its base. Write $\text{Tan } U = 1.15 = \text{Tan } (45° + V)$. $\text{Tan}^2 U = \frac{1 + \text{Sin } (2V)}{1 - \text{Sin } (2V)} = 1.3225$. From which, $\text{Sin } (2V) = 0.13886 = (2V) - \frac{1}{6}(2V)^3$. And $2V = 0.1393 = \frac{0.1393}{0.0002909} = 479′ = 7° 59′$, which makes $V = 4°$, and $U = 49°$. This makes the bearing N. 60° 30′ E. for *A*, 1 horizontal, which bearing can be read directly if the observer is in possession of a transit.

The second observer shows *A*, 1 horizontal to be greater than 90°, as turned from the base-line, with a supplementary angle whose base is 0.191 times its hypotenuse, from which $\text{Cos } U = 0.191 = \text{Sin } (90° - U)$

$= \text{Sin } V = V - \frac{1}{6}V^3$. From this, $V = 0.19214 = \frac{0.19214}{0.0002909} = 660' = 11°$, and $U = 90° - V = 79°$; making the original angle 101°, or a bearing of N. 30° 30′ E. for *A*, 1 horizontal, which bearing could have been read directly if the observer had had a transit.

Upon plotting these bearings (Fig. 4), scale the distance 11,780 ft. from the first base-line observer, and 9060 ft. from the second base-line observer, to the field observers. For practical purposes it will not be necessary to obtain these distances more accurately than can be obtained by a large-scale map. Since the elevations in a topographical map usually require more accuracy than the horizontal measurements, it will be advisable to enter calculations where true vertical angles are read; but, if graphic angles are taken, it will save time and be proportionally as accurate to obtain the elevations by graphic means.

As I wish to explain the application of the formulas, I will assume that the first base-line observer obtains a reading by clinometer for *A*, 1 vertical of + 16°; and the second observer a reading of + 13° 30′.

For the first calculation: Tan 16° = Tan (45° − 29) $= \sqrt{\frac{1 - \text{Sin } 58°}{1 + \text{Sin } 58°}}$. Sin 58° = Sin (60° − 2) = Sin 60° Cos 2° − Cos 60° Sin 2° = $\frac{1}{2}\sqrt{3}(1 - \frac{1}{2}\text{ Sin}^2 2°) - \frac{1}{2}$ Sin 2°; and Sin 2° = 120 × 0.0002909 = 0.03491, making Sin 58° = 0.866 (1 − 0.00061) − 0.01745 = 0.84802; giving Tan 16° = $\sqrt{\frac{0.15198}{1.84802}} = 0.28677$. Multiplying, 11780 × 0.28677, we find 3377, which makes the elevation of the field observers 2101 + 3377 = 5478 ft. Another way to make this calculation would be Tan 16° = $\frac{\text{Sin } 32°}{1 + \text{Cos } 32°}$; Sin 32° = Sin (30° + 2°) = Sin 30° Cos 2° + Cos 30° Sin 2° = $\frac{1}{2}(1 - \frac{1}{2}\text{Sin}^2 2°) + \frac{1}{2}\sqrt{3}$ Sin 2°; Sin 2° = 0.03491, making Sin 32° = $\frac{1}{2}$(1 − 0.00061) + 0.866 × 0.03491 = 0.52993. Cos 32° = Sin 58° = 0.84802, giving Tan 16° = $\frac{0.52993}{1.84802} = 0.28671$.

As a check against this *A*, 1 position of the field observers, the second base-line observer obtains a clinometer-reading for *A*, 1 vertical of + 13° 30′. Tan 13° 30′ = Tan 810′, or *X* = 810 × 0.0002909 = 0.235629; and Tan *X* = *X* + $\frac{1}{3}X^3$ + 0.0001 = 0.235629 + $\frac{1}{3}$(0.235629)³ + 0.0001 = 0.24009. Multiplying 9060 × 0.24009 we obtain 2175 ft., which makes the elevation of the field observers 3320 + 2175 = 5495 ft., as compared to the former calculation of 5478 ft. If 5486 ft. be called the mean elevation of the field observers it will be as close as can be expected from this kind of work.

Assume that the first base-line observer obtains a bearing of N. 15° W. for *B*, 1 horizontal; and that the second base-line observer obtains a bearing of N. 45° W. to the same position. Plotting these bearings, we find the distance from the base-line observer to the field observers to be 5170 ft., and the distance from the second base-line observer to the field observer to be 9890 ft. Also assume that the first base-line observer obtains a clinometer-reading of + 17° for the value of *B*, 1 vertical.

Since the value of Tan 16° has already been determined, take Tan 17° = Tan (16° + 1) = $\frac{\text{Tan } 16° + \text{Tan } 1°}{1 - \text{Tan } 16° \text{ Tan } 1°}$.

The mean value of Tan 16°, from the former determinations, is 0.28674. Tan 1° = Tan 60′ = 60 × 0.0002909 = 0.01745, making Tan 17° =

$$\frac{0.28674 + 0.01745}{1 - 0.28674 \times 0.01745} = 0.30569.$$

Multiplying 5170 × 0.30569, we find 1580 ft., which makes the *B*, 1 elevation of the field observers 2101 + 1580 = 3681 ft. As a check against this elevation, the

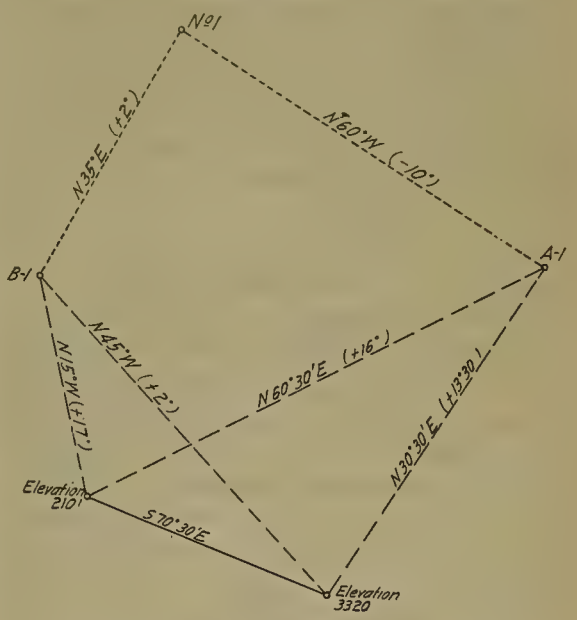

Fig. 4

second base-line observer obtains a clinometer-reading of + 2° for B, 1 vertical. Tan 2° = Tan 120′ = 120 × 0.0002909 = 0.03501.

Multiplying 9890 × 0.03501, we find 346 ft., which makes the *B*, 1 elevation of the field observers 3320 + 346 = 3666 ft., making an average elevation 3673 feet.

Also assume that, either by compass-reading, or from graphic angle, the field observers obtained a bearing of N. 60 W. to point No. 1, as their *A*, 1 horizontal, and in like manner, a bearing of N. 35 E. to point No. 1, as their *B*, 1 horizontal. Plotting these bearings, scale 9060 ft. from *A*, 1 to point No. 1; and 6520 ft. from *B*, 1 to point No. 1. Also assume that the field observers obtain a clinometer-reading of −10° for their value of *A*, 1 vertical. Then Tan 10° = Tan 600′ = 600 × 0.0002909 + $\frac{1}{3}$(600 × 0.0002909)³ = 0.17631. Multiplying 9069 × 0.17631, we find 1597 ft., which indicates an elevation for point No. 1 of 5486 − 1597 = 3889 ft. As a check on this elevation, the field observers obtain a clinometer-reading of + 2° for their value of *B*, 1 vertical. Tan 2° = 0.03501, from the former calculation. Multiplying

6520×0.03501, the result is 228 ft., which indicates the elevation of point No. 1 to be $3673 + 228 = 3901$ ft., which makes 3895 the mean elevation of point 1.

As I do not wish to complicate Fig. 4, I will not show the position of point No. 2, but will assume that it is down a straight hill from point No. 1, and that its position and elevation are determined in a manner identical to that used for point No. 1. Suppose the map that has been constructed shows that point No. 2 is 2000 ft. from point No. 1, and at an elevation of 3455 ft.; then the drop of the hill will be $\frac{440}{2000} = 0.22$ ft. vertical for each one foot horizontal, and we can interpolate contours as in making an ordinary topographical map. Any number of points can be determined, and the whole map completed without introducing any new principles. For important positions, such as enemy batteries, it would be advisable to take three or more complete sets of readings. As an example, suppose, for point No. 1, a $C:D$ and an $E:F$ set were taken in addition to the $A:B$ set already figured. The natural errors in this kind of observation will cause the respective position of point No. 1 to be at the corners of a small triangle. If we take the centre of the triangle as the true position of point No. 1, and the mean of the three elevations as the true elevation, it is probable that we will have an accurate estimation of the true position and elevation of this point.

A practical application of the outlined principles will prove useful. I have taken topography across a gulch by bearings and vertical angles from the side on which I was working, and have obtained quite satisfactory results. The calculations without tables are a practice worth attempting, as it gives an engineer a familiarity with the trigonometric functions such as he can obtain in no other way. After extracting a few cube roots, the extraction of a square root seems a simple problem; and, after working for a while without the use of any reference tables, it seems like 'taking candy' to go back to work with ordinary 'log-tables' and traverse-tables. In time of war, I consider that an engineer should know sufficient chemistry to be able to make a rapid test for the ordinary toxic gases and should know the antidotes for them; he should know sufficient geology to estimate the rock-structure of a hill from its surficial indications; should be enough of a mechanic to armor a car by bending old rails around a motor-truck; and should know sufficient mathematics to be practically independent of tabulated data. Though many of us can never expect to reach even part of these requirements, practice along these lines will prove worth an engineer's time, even if he never enter the military service.

Silver, in a baggage-car of one of the Indian railways, was recently scattered over some distance of the track. The car caught fire, melted the bags of new rupees (1 rupee = 34 cents), and the silver trickled through onto the line. The total amount of metal in transit was 20 lacs of rupees, equal to about $650,000. Natives were sent to recover the precious metal.

Production of Sodium

Sodium sulphate, in the form of salt-cake, is formed when hydrochloric acid is made from common salt by means of sulphuric acid. At least 183,909 tons of salt-cake, valued at $2,987,641, was marketed in the United States in 1917, according to statistics compiled by R. C. Wells, of the U. S. Geological Survey. This quantity indicates the production of at least 104,000 tons of 35% hydrochloric acid if nitre-cake was used, or of 270,000 tons of hydrochloric acid if sulphuric acid was used in its manufacture. Salt-cake is used in making glass, for the best grades of which it must be as nearly free from iron as possible. Material of the quality required is produced either in lead pans, or crude salt-cake is dissolved in water and re-crystallized in the form of Glauber salt, which is separated from the impure solution and converted by drying into glass-maker's salt-cake. The sales of Glauber salt in 1917 amounted to 47,757 tons, valued at $732,403. The sale of a small quantity of crude natural sodium sulphate in 1917 gives promise of the development of a new industry.

Nitre-cake, the residual product in the manufacture of nitric acid from sodium nitrate, differs from salt-cake in containing a large amount of sodium-acid sulphate, or bi-sulphate. The quantity of nitre-cake made in the United States in 1917 was large, owing to the great demand for nitric acid for making explosives. Most of it was probably never marketed. The nitre-cake marketed in 1917 amounted to 387,821 short tons, valued at $780,278. This quantity would require only 316,000 tons of sodium nitrate, whereas the Department of Commerce reports the importation for consumption of 1,725,165 tons of sodium nitrate from Chile in 1917. The difference between these figures may be partly accounted for by the consumption of nitre-cake in making hydrochloric acid and sodium sulphide, which would not, however, require more than 136,000 tons of sodium nitrate, leaving still a large difference to represent either nitre-cake not utilized or sodium nitrate that went into fertilizers or was stored for future use. Many uses have been proposed for nitre-cake, which could probably be obtained in quantity for about $2 per ton.

When nitre-cake is heated with salt, hydrochloric acid is produced and salt-cake remains, but if coal is also present the residue is sodium sulphide instead of sodium sulphate. Sodium sulphide is used in dyeing, in making dyestuffs, in tanning, in cleaning fabrics, in processes of ore flotation, and in precipitation of silver from cyanide solutions. A pure product containing water of crystallization is prepared by re-crystallizing the crude salt, much as Glauber salt is prepared, but for transportation and preservation a more concentrated, nearly water-free salt is used.

The total production of sodium sulphide in 1917 was 49,449 tons, valued at $1,905,263. This includes 36,078 tons of single-strength solution (30 to 32%), valued at $1,073,181, and 13,413 tons of double-strength solution (60 to 62%), valued at $832,082.

HOUGHTON, MICHIGAN

Labor Shortage.—North Lake and Lake Mines.

Labor continues to be the most important problem in the 'Copper Country.' Men are continually leaving the district, most of them to enter the Service, although a good many go to Detroit, where they are attracted by the high wages paid, and where they are unacquainted with local conditions. At no time during the past 15 years, excepting during the strike of 1913, has there been such a limited number of underground men here. There is no complaint about wages, which are the highest ever paid here; and no complaint about living conditions, which are good. The general feeling of unrest is the cause of the present labor situation. The mining companies are doing everything possible to replace the men by power and labor-saving devices, but in spite of this the copper output for the remainder of the year, and for the period of the War, will be abnormally low. Ahmeek is the only mine in this district that has all the men it requires at present.

Of the various Edwards' properties on the south range—the South Lake, Indiana, Algomah, and North Lake—the last-named is the only one in operation. Shortage of labor and the difficulty of keeping men at work at small isolated mines made necessary the shutting-down of the others. At the North Lake, work is confined to two openings, which now look well.

Although the Lake mine did not quite meet expenses during the last fiscal year, its condition is improving, there being a good increase in ore output, with better copper content.

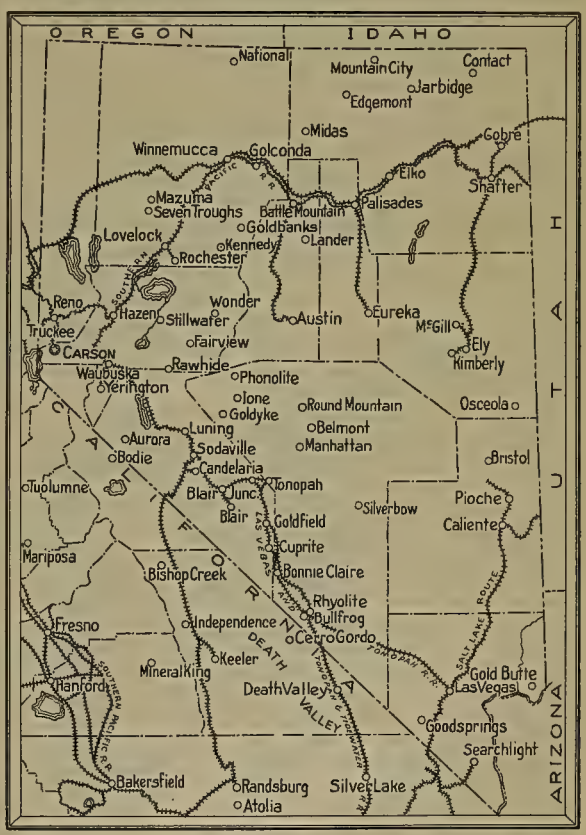
Calumet & Hecla is rapidly driving drifts to be used in the central hoisting scheme. On the Osceola lode the company has 20 electric locomotives employed in tramming. More are to be procured. C. & A. and its subsidiaries are very short of men.

RENO, NEVADA

Gold and Silver.—Divide District.—Goldfield Leases and Tailing Treatment.—Nevada Wonder Mine.—Eureka, Unionville, Pioneer, and Round Mountain Doings.

According to many of the larger operators, gold mining in Nevada is facing extinction if the Government does not aid the industry. Practical results from the American Gold Conference, held here recently, are not expected before four or five months time, and mine-owners generally do not regard with optimism the prospects for legislation that will bring them any concrete benefits. Most of the silver mines of Nevada, including those at Tonopah, are also producers of gold; and would be affected appreciably by any action designed to help gold mining. Silver producers are complaining of certain hardships, some contending that their mines yielded more profit when the metal was 50c. per oz. than at the present price, which is $1.01\frac{1}{2}$. This assertion is not borne out, however, after an examination of production and costs. Further, expansion in silver mining and marked contraction in working gold mines affords ample testimony to the superior condition of silver over gold mining. Silver mines that have greatly curtailed or suspended operations since the United States entered the War have been of recent origin and little developed. It is doubtful if they would have been successful enterprises even in normal times. On the other hand, a number of the producing silver companies are greatly extending development and planning larger production. Others, including the Nevada Wonder, Tonopah Belmont, and Tonopah Mining, and a few in other parts of the State, are developing mines under option to purchase, some as far distant as Central America and British Columbia.

Many gold prospects have been forced to close down, while most of the producers have reduced exploration to a mini-



MAP OF NEVADA.

mum, and there is little or no prospecting for gold in new territory. Inefficiency of available labor, no less than the shortage, has contributed to the difficulties of gold mining. The best miners have gone to the copper and silver districts, where higher wages prevail.

The Divide district, six miles south of Tonopah, is the most active of the new districts in Nevada. The Tonopah Divide, as has been mentioned before in these columns, promises great things. The ore is mainly silver-bearing, with some gold, while the upper levels showed an appreciable quantity of molybdenum. Various processes failed to

recover the latter metal, but gave an extraction of 92% of the precious metals by cyanidation. The ore is to be shipped to the Goldfield Consolidated mill. Electric power is now available and the Divide company is replacing its gasoline hoist by one driven by a motor. The walls of the almost vertical vein are well defined, and it is said that the ore can be handled at low cost. Other companies sinking shafts or developing in this district, none of which has yet exposed pay-ore in quantity, include the Brougher Divide, Tonopah Dividend, Divide Extension, Gold Zone, East Divide, Hasbrouck, Sutherland Divide, and Gold Reef. All have good equipment.

Goldfield is producing nearly $100,000 gross monthly, most of this coming from re-treatment of mill tailing by the Consolidated company. The Lidgerwood radial cableway is delivering 700 tons of this material daily to the mill. More than 60 leases are being worked in Consolidated ground. There are also a number at the Florence and other properties. Some of them are mining rich ore. The Red Hill Florence, Great Bend, C. O. D., and Blue Bull are the only other mines now producing. The Atlanta has exposed some copper-gold ore suitable for flotation, and is developing on the 1850-ft. level. Work is progressing at depth on the Grandma Consolidated, Kewanas, Spearhead, Silver Pick, New Jersey, and will be resumed shortly on the Cracker Jack, Black Butte, and one or two others.

At Wonder, the Nevada Wonder company has reached a depth of 2000 ft. Its mill is treating 150 tons daily, the best ore coming from between the 500 and 700-ft. levels. The Wonder mine has been one of the consistent dividend-payers of Nevada, and the manager, E. E. Carpenter, reports enough ore for many years treatment. The company has acquired the old Monitor Belmont mine, at Belmont, in northern Nye county, and pumps have been installed to unwater the old workings, which were 700 ft. deep. Between 1865 and 1880 the mine produced large quantities of rich silver ore, when costs were over $30 per ton. A flotation plant was erected in recent years to treat the tailing from the old mill, but tests indicate better results from concentration and cyanidation.

Eureka, one of the richest and most prolific of Nevada's bonanza camps, gives promise of a revival under development that is now being conducted on a broad scale for the purpose of re-opening the old mines.

Unionville, in southern Humboldt county, another early-day bonanza, is the scene of efforts to redeem a once famous mine. The old Arizona mine has been purchased from Neil Carmichael by the Sunset Mining & Development Co. It is being re-opened under the direction of F. W. Lockman, who is building a stamp-mill and putting in flotation equipment. Records of the Arizona mine show that following its discovery in 1862 it produced quantities of rich ore and 900 tons of selected ore, hauled by freight-team to Sacramento and shipped in sailing-vessels to Swansea, Wales. This netted the company $480,000. The vein is in blanket form, broken by a series of step-faults, and contains seams from 6 to 24 in. of rich ore. The ore carries silver, with traces of gold. A recent sampling supplied the basis of an estimate of 20,000 tons of 25-oz. ore available. Flotation tests indicate an extraction of 90 to 95%.

At Pioneer, 50 miles south of Goldfield, the Mayflower mine is being worked down to 400 ft. Milling ore of good grade has been exposed in considerable quantity, and the 10-stamp mill is working. The Reorganized Pioneer Mines Co., formerly the Pioneer Consolidated, has resumed development and will sink its 425-ft. shaft to 1000 feet.

In Jefferson canyon, near Round Mountain, the Jefferson Gold & Copper Co. has blocked out a large tonnage of ore, including some of high grade, in working through four tunnels. The flotation plant has not effected satisfactory recovery, and cyanidation will be resumed.

CRIPPLE CREEK, COLORADO

A. I. M. E. Visit.—Cresson, Stratton Estate, Leasing, and Drainage-Tunnel.

The American Institute of Mining Engineers and friends, 220 strong, visited the Cripple Creek district, coming by special train supplied by the Midland Terminal Railroad—A. E. Carlton, president—on September 4. The town was first visited. On the return to Victor a party of 17, headed by Dr. L. D. Ricketts, stopped off at Elkton and visited the Cresson mine, accompanied by Charles Noble, consulting engineer for the company. The main party stopped at Victor, where they were met by Frank Smale, manager, G. M. Taylor, and T. B. Crowe, and assistants, of the Portland company. Among the party were S. J. Jennings, C. W. Goodale, Robert M. Raymond, F. S. Cottrell, H. M. Evanson, S. L. Goodale, H. Foster Bain, George S. Rice, D. A. Lyon, W. R. Ingalls, E. P. Mathewson, Milnor Roberts, and Malcomb Muir.

Luncheon was served in a large tent erected near the Independence mill. Following this the visitors were shown through the plant or taken in autos to the No. 1 Portland shaft and through the mine. There was no formal speech-making. H. Foster Bain, of the U. S. Bureau of Mines, in an interview stated as follows: "I feel confident that something will be done for the gold camps after election. I am equally confident that nothing will be done in the way of allowing premiums on gold, or other steps taken prior to election. Congress has an immense amount of work before it in the form of legislation that must be disposed of before new legislation can be considered." Dr. Ricketts expressed the opinion that the "Cresson mine is today the richest gold mine in the world, and its rich deposits of gold ore will not be exhausted for many years to come." The visitors were taken to the 10th level, where a new and rich orebody is under development. A specimen presented to one of the ladies was fully 75% calaverite.

Net earnings of the Cresson for July amounted to $136,-054. Ore-reserves on August 1 are estimated as worth $3,055,708. Cash in bank is $1,025,133. An interesting feature of the July report is a shipment from the Roosevelt tunnel-level of 315 tons of $20.50 ore. The orebody from which it came is 50 ft. long on the dike.

Ten properties of Stratton Cripple Creek Mining & Development Co.—the American Eagles, Orpha May, Los Angeles, Six Points, and Longfellow, on Bull hill; Deerhorn, on Globe hill; Callie, on Gold hill; Nightingale, on Raven hill; New Boston on Womack hill; and the Keener tunnel dump, on Globe hill, are active under the leasing system. The first is the only one in which the company is directly interested. It is operated under the split-check system; royalties are paid by the others.

The August production from leased properties of the United Gold Mines Co. totaled 1785 tons, averaging $18 per ton.

A surface strike has been made at the New Boston, a Stratton Estate property on Womack hill. At a depth of 30 ft. the ore is rich. A trial shipment will be sent out the latter part of this week by the lessee, Abe Jones, a pioneer prospector.

At the annual meeting of shareholders of the C. O. D. Mining & Development Co. it was decided on a liberal leasing policy for the development of the C. O. D. mine in Poverty gulch.

The Roosevelt tunnel had 506 ft. of work done in the Portland and Cresson drifts during August, despite the labor shortage. The Portland drift toward No. 2 shaft was advanced 220 ft., and the two Cresson drifts 277 ft. The flow from the tunnel has fallen to 3000 gal. per minute.

The Independence mill of the Portland company is treating 1350 tons of $2.25 ore daily, at a cost of $1.11 per ton.

THE MINING SUMMARY

ALASKA

Juneau.—Alaska Gastineau in August treated 96,250 tons of $1.367 ore, with 82% recovery. This compares with 74,830 tons and $1.319 in July.

ARIZONA

Bisbee.—Copper output of the Phelps Dodge properties in August amounted to 17,101,261 lb. The total for 8 months is 149,000,000 pounds.

MILL OF MORENCI BRANCH OF PHELPS DODGE CORPORATION.

Chloride.—The Chloride Queen Mining Co. has just erected a 60-hp. gas engine, compressor, and pumps. There will be sufficient air for four jack-hammers. Development is under way on the 230-ft. level.

The Schuylkill Mining Co., has re-timbered the old Tennessee shaft and completed tracks on the 900-ft. level. Driving on this level toward the Schuylkill workings is under way. The ore in the face of the drift looks well. It is reported that the company has completed arrangements for the erection of a 250-ton mill.

Globe.—Old Dominion pays $1 per share on September 30. This makes $3 for the current year.

Jerome.—Copper production of this district in August was 12,000,000 lb.—7,500,000 lb. from the United Verde and the remainder from the Extension.

The suit of William Kemp et al. versus the Hull Copper Co. and Charles W. Clark, trustee, was brought to a sudden close and settled in the Superior Court of Yavapai county on August 30. A compromise was effected whereby Clark is to return to the treasury of the company 2,500,000 shares for cancellation, and is to have his title quieted to 5,181,173 shares still remaining in his possession. This gives Clark control of the Hull organization. The Hull company owns properties adjacent to both the United Verde and the Extension, and are considered to be valuable. It is stated unofficially that development will soon be arranged by the new board of directors.

Four headings are being worked on the 1080-ft. level of the Verde Combination, three of which are looking well.

The shaft at the Gadsden has been sunk 25 ft. below the 1200-ft. level for a sump, and a station is now being cut at 1200 ft. The ground is very soft and wet and difficult to work.

In diamond-drilling at the Calumet & Jerome in hole No. 4, which is being driven from a point near the winze on the 600-ft. level, the rods broke in two places, and it has been necessary to instal a larger machine to ream out the hole to extract the broken rods. The bore was down 215 ft. when the accident occurred in schist carrying considerable pyrite.

The work of sinking the Dorothy May shaft of the Green Monster has progressed steadily, a depth of 849 ft. having been attained. The formation at the bottom is diorite.

With the exception of finishing the station on the 900-ft. level of the Jerome Verde company's Maintop, everything is ready for shipment from the orebody on that claim. It is probable that by September 15 about 20 tons per day will be hauled by wagon to Clarkdale and shipped by the Santa Fe to the Consolidated Arizona smelter at Humboldt.

The Shea mine will probably be the next shipper in the Verde district. For some time it has been known that high-grade ore could be sorted from that being extracted from the drift running west on the level at the bottom of the 350-ft. incline shaft. The only thing that has delayed such action has been the desire to speed-up development. Inadequate equipment and lack of power has retarded greatly work at this property.

Kingman.—The Leviathan mine is shipping a carload of molybdenum concentrate monthly to its chemical plant at Los Angeles. This concentrate carries 16% MoS_2 and 16% Cu.

Miami.—Inspiration produced 9,000,000 lb. of copper in August. This is about 2,500,000 lb. below normal capacity.

The Miami Copper Co.'s August output of 5,374,000 lb. was a record. It was 600,000 lb. larger than that for July. The total for the eight months is 39,260,000 pounds.

Oatman.—The United Eastern company pays its regular monthly dividend of 5c. per share on September 26. No. 7 level of the mine is opening extremely well.

The Gold Ore has opened $20 ore on its 650-ft. level. After driving 60 ft. the vein widened to 27 ft. This is now to be blocked out. A. C. Werden is in charge.

The Record Lode shaft is down 433 ft., on its way to 500 ft.; $17 ore was opened on the 300-ft. level.

The Mossback and Oatman United continue prospecting.

Patagonia.—Recent tests made on manganese ore from the Mowry mine have been successful, and machinery for a concentrating plant has been ordered. There is said to be a large body of low-grade ore available.

It is reported that the Flux mill is now successfully treating 200 tons of complex ore per day from the Flux mine. The flow-sheet is said to be similar to that of the new mill of the Shattuck-Arizona at Bisbee.

Ray.—The Ray Consolidated pays 75c. per share on September 25.

Tombstone.—Three properties in the Huachuca mountains are now producing scheelite. They are the Huachuca Tungsten Mining & Milling Co., Sunny South, and Cave Man.

Tucson.—Bulletin 91 of the Arizona Bureau of Mines, by M. A. Allen and G. M. Butler, covers the manganese situation. The types of ore, deposits in Arizona, producers, uses, prices, and dealers are given. Manganiferous-silver

ore is found at Tombstone, Patagonia, Bisbee, Superior, Clifton, Morenci, Dos Cabezos, and near Globe. Several deposits of manganese have been worked in the Big Horn mountains, in the northern part of Maricopa county; and one in Yavapai county, in part of the Harcouvan mountains, near the Maricopa county line. Some promising deposits exist 5 miles north-west of Tappan ranch, on the Williams river, in Mohave county; but they are 45 miles from rail. There are 36 producers of manganase in Arizona.

CALIFORNIA

Amador City.—The Central Eureka Mining Co. has issued a circular reviewing the past three months work. Early in May there was not enough ore blocked out to supply 20 stamps for over two weeks. The shaft has since been deepened to 3555 ft. Below 3425 and 3500 ft. it is in greenstone. From the 3500-ft. station a south-west cross-cut at 45 ft., near the greenstone-slate contact, found the hanging-wall vein; 25 ft. farther on another vein was cut, and is now being followed. Above the north drift a raise is being driven to connect the 3400 and 3200-ft. levels. Stopes above this drift supplied most of the good ore during the past two months. A good deal of exploration has been done at other points. In addition to regular development, 30 men have to care for 6300 ft. of 3-compartment shafts. Three years ago, 60 men were employed at $2.50 per shift; while today 30 men receive $4. Carmen get $3.50. As the South Eureka had stopped work, in order to keep down water, the Central had to hoist it by skips in the South company's shaft, under agreement, until the Deane pump on the 2000-ft. level was repaired. The unexpected cost of pump repairs, etc., was $8000. Motor-driven pumps were installed at 2900 and 2700 ft. of the South Eureka, replacing air pumps. This will save the Central $150 per month. Bills for mine timber ($7500), for wire rope ($2500), and for pump crankshaft ($1200) have to be met at an early date. A disputed claim of $6000, made by the South Eureka, was settled by paying $3000, of which $2250 is due on monthly installments of $250. A note for $4000 is due the bank in October. The treasury contains $3559, and as banking accommodation may be difficult to obtain, an assessment of 2½ cents per share is to be levied. This will amount to $37,500.

Grass Valley.—For the disposal of tailing from its cyanide plant the North Star Mines Co. has erected an aerial tram 1225 ft. long. This enables the residue to be dumped above the east side of Wolf creek.

Plymouth.—The California Exploration Co., which is interested in the Plymouth Consolidated, paid a dividend of 12c. per share on August 20. The amount is $27,794.

Sonora.—It is reported that the drainage-tunnel of the Springfield company requires only 120 ft. for completion. Extraction of gold-bearing gravel is expected to commence in November. Some chrome is being developed in this district.

COLORADO

Breckenridge.—Dredging by the five boats in this district continues at full capacity.

The Iron Mask mine shipped rich gold-silver-lead (carbonate) ore last week.

Lessees at the Dunkin sent out 75 tons of 15 oz. silver and 45% lead ore.

The Silver King and other claims have been bonded to Senator S. Fincher.

The Wellington Mines Co. continues to make a regular output of zinc concentrate.

Rico.—The Rico Consolidated Mining Co. and F. B. Townsend have started suit against the Rico-Argentine Mining Co. for $900,000, alleging wrongful extraction of ore. The defendant considers that not more than $10,000 has been mined from the disputed ground, through which it has arranged to continue work pending the suit. The Rico-Argentine also claims apex-rights to the vein. The disputed ground is said to be in a portion of the plaintiff's Alleghany claim, which overlaps an older patented claim of the Argentine.

Silverton.—The new wage-scale for this district is as under, according to the 'Miners' Magazine' for September: Eight hours shall constitute a day's labor in and around the mines, mills, and smelters; $4.50 shall constitute a minimum wage. All classes working in wet places where rubber clothes are required, 50c. per day additional. For sinking and raising, 50c. additional shall be added. Pay-day twice a month. The scale of wages shall be based on $1 per day board.

Miners

Machine-men	$5.25	Mule-drivers	$4.50
Helpers	4.75	Nippers	4.50
Timber-men	5.25	Trammers	4.50
Helpers	4.75	Shovelers	4.50
Engine-men	5.25	Blasters	4.75
Station-tenders	4.50	Firemen	4.75
Blacksmiths	5.25	Hammer-men	4.50
Helpers	4.50		

Tramway Men

Oilers and linemen	5.25	Gripmen	4.75
Brakemen	4.75	Bucket-men	4.75

Mill-Men

Repair-men	5.50	Crusher-men	4.50
All operators	4.75	Roustabouts	4.50
Canvas-plant men	4.50	Flotation men	5.00

Telluride.—Ore and concentrate shipments from this centre in August totaled 102 carloads. The Tomboy dispatched 36, and Smuggler-Union 60, to smelters.

MISSOURI

Duenweg.—Thomas H. Noonan, of Webb City, formerly superintendent of the Wilson mine on the Boston-Duenweg, has secured a lease on 230 acres of land, including the Boston-Duenweg, the King Bill, and Royal, and is sub-leasing the ground to practical miners at a royalty of 15%. Mining was first done in sheet-ground at a depth of 250 ft., but on account of thin ore and low prices, work was unprofitable. The soft ground at 150 ft. is now to be mined. Hand-jigs are being used for cleaning the ore.

Joplin.—Production of the region last week was 9723 tons of blende, 95 tons of calamine, and 1493 tons of lead. These averaged $54, $40, and $100 per ton, respectively. Total value was $677,466, of which Missouri contributed $185,196. For 36 weeks the output is $17,420,875.

No. 3 mine of the A. W. C. company is the only property being worked in the West Joplin sheet-ground area. This ore carries a good deal of lead, which is very profitable to extract at present prices. Only one of its four mills is concentrating ore.

MONTANA

Butte.—Zinc in concentrate produced by Butte & Superior during August was 17,250,000 lb., compared with 11,500,000 lb. in July and June. The silver output was 220,000 ounces.

Anaconda produced 24,900,000 lb. of copper in August, 500,000 lb. less than in July.

East Butte yielded 1,714,358 lb. of copper in August, a decrease of 362,000 lb. when compared with July.

Troy.—The Snowstorm mill concentrated 5000 tons of ore during August. More men are expected after the harvest. No. 7 tunnel is in 900 ft.; the total length to be 2200 feet.

NEVADA

Carson.—High-grade manganese is being opened at the head of Brunswick canyon, near here.

Ely.—Nevada Consolidated pays 75c. per share on September 25.

Goldfield.—The Klondyke-Portland Co. has been formed

with the following officers: Peter Felis, president; M. F. Hill, vice-president; J. B. Witt and Mrs. Helen Rosenthal, directors; and J. F. Henry, secretary-treasurer. The property of 9 claims is in the Klondyke district, north of Goldfield. At different periods within the last 8 years three shafts were sunk, the deepest to 180 ft. Near the 55-ft. shaft, gold-silver-copper ore worth $60,000 was mined. An extension of this shoot is to be sought.

Luning.—The Kirchen Mines Co.'s property here has been sold at sheriff's auction to satisfy a judgment for $2168 in favor of the Luning Mercantile Company.

Manhattan.—The White Caps shaft is down 25 ft. below the 500-ft. level. Two shifts are employed. The mill is treating 110 tons daily.

The Union Amalgamated has had a change of management, W. B. Merton being superintendent. The mine is being sampled by W. Richardson and W. P. McCarthy.

The Thanksgiving Mining Co. is resuming work. Before being closed the mine was opened to a depth of 430 ft. The shaft is to be sunk another 100 feet.

Pioche.—A quarter interest in the Davidson manganese mine here has been sold by H. C. Hall of Las Vegas to the Prince Consolidated M. & S. Co. for $60,500 cash. This company now owns the property.

Tonopah.—The Midway company has cut 4 ft. of good ore 500 ft. south-west of the shaft, on the 600-ft. level. The vein indicates persistence. It was discovered by a raise being driven on another orebody.

The West End and Jim Butler companies have made a settlement in the apex suit. The proceeds of ore mined in the disputed ground—$400,000 held in escrow—is to be released. The West End gets this money; also the remainder of the ore. The August output was valued at $111,893.

NEW MEXICO

Mogollon.—Road improvement between this place and Magdalena is being done by convict labor.

Red Rock.—The Great Eagle fluorspar mine near this place is shipping four carloads weekly. Most of this goes to San Francisco. Chicago gets one car assaying 97.97 CaF_2. By certain work on the 100-ft. level it is estimated that 50,000 tons will be blocked out.

Santa Rita.—Chino Copper Co. pays $1 per share on September 25.

OKLAHOMA

Picher.—Production of the fields last week totaled 5681 tons of blende and 1213 tons of lead, valued at $430,350.

TEXAS

San Antonio.—Manuel F. Palacio of Saltillo, Mexico, representing Governor Espinosa Mireles of the State of Coahuila, has been sent to the United States for the purpose of interesting American capital in the development of extensive iron-ore beds, coalfields, forests, fibre, and other native products. It is stated that he has authority to offer liberal inducements in the way of concessions for foreign investments in these industries. Many of these resources are situated within 10 to 200 miles of the Rio Grande border. Mr. Palacio will visit St. Louis, Pittsburgh, New York, Chicago, Kansas City, Denver, Los Angeles, and other cities. In connection with coal mining, which was being carried on in Coahuila for several years up to the beginning of the revolutionary period, it may be stated that R. H. McCraken, of San Antonio, was the pioneer in that development. In 1878 he was manager of the Cedral silver-lead mines, and found bituminous coal outcropping there. He had some ovens built to make coke, used it successfully to reduce the Cedral ores; so starting the use of Mexican coal and coke. He examined the Santa Rosa valley and found bituminous coal in large quantities. Eminent geologists and coal men disputed his assertions, but Mr. McCracken was right.

UTAH

Bingham.—The Bingham Mines Co. pays 50c. per share on October 1. This is equal to $70,000, making $210,000 for the current year.

Utah Copper Co. pays $2.50 per share on September 25.

Milford.—The Majestic Mines Co. is cutting a station at 400 ft. The shaft is to be sunk to 500 ft. before prospecting starts. A. D. Moffat is manager. Lessees are mining rich copper ore at the O. K. end of the Majestic.

The Old Hickory is sinking a shaft in the open-cut, which produced a large quantity of copper-silver ore. In July, three cars of ore averaged $400 per car.

Park City.—Mines in this district last week shipped 1789

DALY-JUDGE MILL, PARK CITY, UTAH.

tons of ore. The Judge M. & S. Co. sent out 505 tons, with 135 tons of electrolytic zinc; the Ontario 519 tons of ore, the Daly West 138 tons, and Silver King Coalition 395 tons.

On October 5 the Ontario Silver Mining Co. pays 50c. per share, equal to $75,000.

Tintic.—The Liberal Manganese Mining Co. has been organized at Salt Lake City to operate 11 claims in the Erickson district. T. L. McCarthy is president. The ore carries from 25 to 40% Mn. It has to be hauled 28 miles to rail.

The Eagle & Blue Bell company pays 10c. per share on September 20. This amounts to $89,315.

WASHINGTON

Republic.—The Last Chance mine shipped 1500 tons of $12 gold ore to Trail during August. The deepest workings are at 500 ft. The shaft may be sunk later. Thirteen men and a foreman are employed.

CANADA

Quebec

The annual report of the superintendent of mines, Theo. C. Dennis, for this Province, for the year 1917, has just been published. The mineral production, including building materials, was valued at $16,266,480. This is an increase of $3,000,000. The minerals of most interest to Americans are as under:

Mineral	Men employed	Tons	Value
Asbestos	3,154	137,242	$7,198,558
Chromite	268	36,186	498,301
Copper and sulphur	311	122,822	1,205,242
Gold, ounces	21	1,116	22,570
Graphite, pounds	90	1,078,000	99,024
Magnesite	294	58,340	729,025
Mica, pounds	220	1,531,629	281,234
Molybdenite, pounds	289	226,739	238,096

All of these, save copper, showed a large increase in value over that of 1916. Asbestos producers pay the Government a royalty of 2% on the gross value of the mineral extracted. There were 14 producers. Some of the chromite in the above list—assaying from 12 to 30% Cr_2O_3—was sold by

miners to mills, where it was dressed to 45 or 50%. The Mutual Chemical Co.'s chrome mill consists of a 9 by 15-in. jaw-crusher, thirty 950-lb. stamps, crushing through 20-mesh, and seven Wilfley tables. Its daily capacity is 70 tons of 12% ore, concentrated to 50%. Most of the molybdenite assayed 75% MoS_2 and over. A great deal of exploration was done at the Moss mine of the Dominion Molybdenite Co., near Quoyon. From June to October, 12,000 ft. of diamond-drilling was done, with satisfactory results. The Wood flotation machines in the mill gave high-grade concentrate, but a low recovery. The Callow system was eventually installed in the 150-ton mill. The magnesite output includes raw and calcined material, equal to 64,000 tons of crude ore.

Ottawa.—Since July 1914 the Dominion Mint has received gold coin and bullion valued at $1,300,000,000. The refinery was greatly enlarged. The bullion received was 15,992,770 oz., yielding 14,048,803 oz. of fine metal.

CHILE

La Fundicion.—Cerro de Pasco produced 5,786,000 lb. of copper in August, 550,000 lb. more than in July, but 100,000 less than in June.

COSTA RICA

The report of the Abangarez Gold Fields of Costa Rica for the year 1917 has just been issued. The property is in the Guanacaste district. New York people, headed by M. C. Keith, own the mine. The past three years results show the following:

	1917	1916	1915
Ore treated, tons	62,934	50,221	25,262
Gross yield	$636,298	$670,574	$197,619
Average per ton	10.12	13.35	7.82
Total cost per ton	7.26	8.48	8.18
Interest charge per ton	1.08	1.57	3.11
Profit	$178,733	$244,951	$9,244*

*Loss.

Interest on loans, etc., reduced the 1917 profit to $110,-580. Current assets totaled $179,937 and liabilities $205,-978, including unpaid coupons $155,315. The notes payable total $1,143,248.

MEXICO

Mexico City.—According to a telegram of August 31 from the American Consul-General at Mexico City, a decree has been published granting exemption from import duty to all mining and industrial machinery from September 1. Such machinery was formerly dutiable at ₱0.02 per kilogramme, or $0.45 per 100 pounds.

Tamaulipas

Tampico.—A Consular Report states that declared exports of crude oil and petroleum products from the Tampico district to the United States in July 1918 amounted to 3,435,545 bbl. The movement from Tampico was 2,783,300 bbl., from Tuxpan 441,245, and from the new shipping point of Port Lobos 211,000 bbl. Shipments to points other than the United States during the same period were 1,309,290 bbl.—676,916 from Tampico and 632,374 from Tuxpan. Gross exports, therefore, reached a total of 4,744,835 bbl., a record month for the present year.

NICARAGUA

Bluefields.—The Eden Mining Co., a subsidiary of the Tonopah Mining Co. of Nevada, operating in the Pis Pis district, closed its 150-ton mill in March last, owing to a shortage of power. Additions to the water-supply will soon make available from 500 to 700 hp. more, giving a total of 1400 hp. The plant will then be started again. Mine development continues. The property is opened by tunnels. The Culebra vein has 500 ft. of backs, and the Eden vein 250 ft. The mill includes a ball-mill, ball tube-mill, and cyanide plant. Native labor is plentiful but inefficient. There were many difficulties in operating in this region, according to W. H. Blackburn, general superintendent, who recently returned to Nevada.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

Hallet R. Robbins is here from Washington.

Albert Burch is expected back from Washington.

O. E. Monette, of Los Angeles, is here on a short visit.

H. H. Stout, Jr., of Douglas, Arizona, is at the Fairmont hotel.

H. A. Cohen is examining a mine in Plumas county, California.

C. L. Morgan was in San Francisco from Guadalupe de los Reyes, Mexico.

A. F. Keene (formerly Kuehn) has left London and is now established at 42 Broadway, New York.

S. R. Brown, mine superintendent for the Porphyry Dyke Gold Mining Co., has joined the 27th Engineers.

Todd C. Woodworth, formerly in Mexico, has enlisted in the 42nd Canadian Highlanders and is now in France.

Karl Eilers and **H. A. Prosser** are making their semi-annual tour of inspection of the A. S. & R. plants in the West.

Walter Hovey Hill has moved from Homestead, Oregon, to Boise, Idaho, after having spent three months visiting the mines of central Idaho.

K. A. Cunningham has been promoted from superintendent of the Guanajuato Development Co. to general manager at Guanajuato, Mexico.

J. M. Wadsworth, petroleum engineer for the U. S. Bureau of Mines, has been appointed efficiency engineer for the Fuel Administration in California.

P. M. Anderson, consulting engineer to A. Goerz & Co., now the Union Corporation, Ltd., is here from Johannesburg. He sails for South Africa on October 12.

John C. Greenway, general manager for the Calumet & Arizona, has been promoted to Lieutenant-Colonel and has been transferred, at his own request, from the Engineers to the Infantry of the A. E. F.

C. A. Rice is superintendent of the Oronogo Mutual mine near Joplin, Missouri, for the new owner, the Athletic Mining & Smelting Co. **Guy H. Warring**, previously in charge, is joining the Service.

Harrison E. Clement has recently been appointed general manager for the American Mining & Exploration Co., operating the Imlay and Rye Patch mines in the Humboldt district, Nevada, with headquarters at Imlay.

F. W. Bunyan delivered an interesting address on Brazil before the local section of the American Chemical Society on September 14. He has been appointed assistant chemist to the Noble Electric Steel Co. and will proceed shortly to Heroult, in Shasta county, California.

George E. Price died on July 24 at Charlotte, North Carolina, at the age of 60. For the three last years of his life he was engineer in charge of the Rudisill mine; previously he had been in many parts of the world, including Western Australia, West Africa, and Bolivia. His son, Ely R. Price, is sergeant in the American Expeditionary Force in France.

The Consolidated Mining & Smelting Co. of Canada has announced, through J. J. Warren, the managing director, that it will give a scholarship of $500 per annum, commencing next year, to the man standing first, among the families of its employees—the latter being restricted to those engaged at day labor—in his matriculation examination for an applied science course in the University of British Columbia. Further study that this grant will help pay for may be taken at this or any Canadian university.

THE METAL MARKET

METAL PRICES

San Francisco, September 17

Aluminum-dust, large and small lots, cents per lb	65—70
Antimony (wholesale), cents per pound	16
Copper, electrolytic, cents per pound, in carload lots	26.00
Copper, electrolytic, cents per pound, in small quantities	27.35
Lead, pig, cents per pound	8.30—9.30
Platinum, Government price, per ounce	$105
Quicksilver, per flask of 75 lb	$120
Spelter, cents per pound	12
Zinc-dust, cents per pound	16

ORE PRICES

September 17

Antimony, 45% metal, f.o.b. California, per unit	$1.10
Chrome, 38 to 48%, California, per unit	$1.25—$1.50
Fluorspar, 85% CaF_2, f.o.b. shipping point, or San Francisco, per ton	$22—$30
Magnesite, crude, California, per ton (nominal price)	$7.00—8.00
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 45%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 85% MoS_2	$1.00
Pyrite, per unit of sulphur, cents	28—32
Tungsten, 60% WO_3, California, per unit	$20—$25

EASTERN METAL MARKET

(By wire from New York)

September 17.—Copper is unchanged. Lead is scarce and firm. Spelter is quiet but strong.

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government has fixed its maximum at 48.81 pence for metal 925 fine.

Silver exports from San Francisco during August were as follows: to China, $5,826,559; to India, $9,900,151; and to Mexico, $242,166 (coin).

The Federal Reserve Board has decided to regulate more closely the outgo of silver from this country by preventing unnecessary exports. Heavy inroads on the stocks of silver have been made, resulting from the more liberal policy heretofore followed by the Board with respect to exports.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.35c., respectively, until August 15. On August 7 the current rates were again fixed until November 1, prices to be effective on the day of shipment, not the day of sale.

Quotations in cents per pound are as under:

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. This is to be continued until January 1, 1919, the price at point of delivery to be at East St. Louis plus freight. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

Lead ore (80% metal) is firm at $100 per ton at Joplin. Premium ore realizes $104.50.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefor $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds.

Two-thirds of the pig-tin supply of the world will be received by the United States, under a pooling arrangement made at a recent conference at London of representatives of America, Great Britain, France, and Italy. This is announced by War Industries Board. All shipments of pig-tin and tin ores to this country will be consigned to the American Iron and Steel Institute, which will distribute it at regulated prices to the consumers.

ORES (New York)

Antimony: Again there is no news in this market.

Ferro-manganese: There are now five companies in the United States making ferro-manganese in electric furnaces—three on the Pacific Coast, one in Colorado, and one in Alabama. The Anaconda Copper Mining Co. will soon be a new maker on a large scale at Butte. Quotations are firm at $250 per ton, delivered, for 70% alloy, with $3.50 per unit added or subtracted above or below this level.

Molybdenum: More inquiry is appearing, and the market is more interesting, but quotations are nominally unchanged at $1 per pound.

Tungsten: There have been ready sales of high-grade ore as well as low-grade, the former going at $24.50 to $25.50 per unit, and the latter at $20 to $24. Ferro-tungsten is strong, one maker asking $2.50 per pound.

Eastern Metal Market

New York, September 11.

The markets are all quiet so far as buying is concerned, and the major ones are very strong.

The labor situation is the serious factor in copper, both in the output of crude and refined.

Tin is very quiet and continues to fall gradually. The trade is much interested in the possibility of an Inter-Allied Tin Executive Committee to sit in London in control of the world market.

Lead is still very scarce and under voluntary control.

Zinc is not active but is firm and higher. The tone is strong.

Antimony is quiet and steady.

The vast scale of the plans for the offensives in France appears in calls for more steel each week. Barbed wire to the extent of 34,000 tons has just been distributed from our own Government, and France wants 22,000 tons. An indication of the enlargement of the munitions program is found in the placing of 10,000,000 additional shell forgings in the Cleveland district. A re-assurance pervades the steel trade that the pending draft will not interfere with essential industries. Preparations for the meeting in Washington, September 18, next week, are engaging producers in various lines. Preliminary meetings are being held in New York this week, prominent among which is that of the pig-iron makers. Iron-ore interests will meet later. Advancing costs make the cases of those who are pressing for advances stronger than at any other time recently. Smaller producers are outspoken in calling for a separation of their case from that of integrated companies, but they are not ready to have the Government take over all output at differential prices.

COPPER

Undoubtedly the labor situation will control the destinies of the copper market of the future. While this phase of the industry is not critical just now, it is the cause of some anxiety on the part of producers, and the Government as represented by the War Industries Board. Production of both crude and refined metal is not as large as it should be, and this is blamed largely on the labor situation. The draft had deteriorated the kind of labor—perhaps not the number—but those replacing others called up are not as efficient or skilled. When the new draft is made effective, the result may be still worse. As copper is prominently a war industry, the regulation of the labor problem is vital to conserve the output of both refined and crude copper. Already it is estimated that the August output of refined copper was only 175,000,000 lb. This compares with 205,000,000 lb. in July and 215,000,000 to 220,000,000 lb. in the spring months. The statement is made that, because of the labor-shortage, the refiners are operating at only 75% of capacity. The output of crude copper is being found fault with in some quarters. The entire situation is full of possibilities, good and bad. The 26c. price for copper holds until November 1 when a revision is due, and some expect an increased price. For jobbing lots 27.35c. per lb. is the maximum price.

TIN

The most interesting news in this market in a long time is the unofficial and unconfirmed report that an Inter-Allied Executive Tin Committee has been established to sit in London to control the price and distribution of tin to the Allies. It is believed that this is one result of the present London conference to which Mr. Hughes, chairman of the Tin Committee of this country, went some weeks ago. The personnel of this committee, according to report, is to consist of two Englishmen, two Americans, one Chinaman, one Japanese, and one Hollander. Evidently it is the intention to bring under one control all brands of tin and to limit prices and profits. Thus far there has been no co-operation between the Chinese and the Dutch interests on the one hand and the interests of other producers. The market in general is dead. Prices continue to ease, and, while this is so, buyers refrain from showing any interest. There has been no business reported in the week covered by this review, and the sales in the last six weeks have been smaller than ever. The nominal price for spot tin is 83c. New York, while shipment from the Far East could probably be obtained at about 73c. per lb., as against 76.50c. a week ago. The price at the height of the upward movement some weeks ago was 97c. per lb. The London market also is still declining. Yesterday spot Straits was quoted at £343 10s. per ton, against £353 10s. a week ago. Deliveries of tin at all ports in August were large. The total for the month was 5953 tons, of which 3903 tons was received at Pacific ports, with 2050 at Atlantic ports. This total contrasts with 6782 tons in June. Tin in stock and landing August 31 was 715 tons. Imports of tin from January 1 to September 1, 1918, have been 42,414 tons, of which the Straits Settlements are credited with 23,323 tons. In the same eight months in 1917 the imports were 39,130 tons. The average quotation for spot tin in New York for August was nominal at 91.33c. per pound.

LEAD

There is nothing to be said about this market in addition to what has been reported in the past few weeks. The dominant factor is the scarcity of the metal, and there is still no relief in sight. The lead producers' committee, a voluntary organization, is closely controlling all sales and distribution, and not a ton can be sold except by their consent, so serious is the situation. Confidence is general and strong that the matter is being ably handled. The maximum prices laid down by agreement are 7.75c. per lb., St. Louis, or 8.05c., New York, for carload and larger lots, with less than carloads held at 8.55c. per lb., New York, above which dealers cannot advance their price. For less than one ton, 8.80c. is the price. These levels are considered fair. That they may be advanced in the future is possible, but there is no prospect at present.

ZINC

The temporary reaction, noted last week, has come to an end and the market seems to be in for a rise again. The tone is strong, with quotations firm, though largely nominal. Prompt and September prime Western is quoted at 9.25c., St. Louis, or 9.50c., New York, with very little metal being offered. Most producers and dealers, being comfortably filled with orders, are sitting tight, and are not anxious to sell at the present levels, not oven for more forward positions. It is evident that they look for higher levels soon. They base this on the probable purchase this week by the Government of 6000 tons of grades C and D zinc for delivery in the last quarter and on the fact that the weekly Government reports of this industry show little change or increase in stocks of any grade. For October delivery about 9.10 to 9.15c., St. Louis, is asked, and for the last quarter the quotation is 9 to 9.05c. Very few orders for any position are reported as having been booked in the last week.

It is stated that galvanized-sheet makers will ask for a higher fixed price because of the advanced cost of prime Western zinc.

Company Reports

AMALGAMATED ZINC (DE BAVAY'S) LTD.

Property: company buys zinciferous tailing from Broken Hill, New South Wales, mines and concentrates it by flotation.

Operating Officials: David Meredith, general manager; A. J. F. de Bavay, consulting chemist and metallurgist.

Financial Statement: for the half-year ended December 31, 1917, an operating profit of £20,214 ($96,000) was made. A dividend (No. 23) absorbed £25,000 ($120,000). Excess of current assets over liabilities is £149,040 ($710,000), exclusive of tailing paid for and shares in Electrolytic Zinc Co., Minerals Separation and DeBavay's Processes, Barrier Roaster Co., Zinc Investigation Co., and Zinc Producers' Association.

Flotation Operations: the plant worked about 70% of possible time, due to labor troubles. There was dressed 84,265 tons (equal to 800 tons daily) of material yielding 24,387 tons of concentrate assaying 48% zinc, 6.7% lead, and 8.6 oz. silver; also 928 tons containing 52.3% lead, 12.8% zinc, and 49.5 oz. silver.

The Electrolytic Zinc Co.'s first unit of 10 tons of spelter daily was started in January 1917, but enough power is not being supplied by the Tasmanian government. The electrolytic plant is to be enlarged to 100 tons capacity.

BROKEN HILL SOUTH SILVER MINING CO.

Property: lead-silver-zinc mine and works at Broken Hill, New South Wales, Australia.

Operating Official: W. E. Wainwright, manager.

Financial Statement: in half-year ended December 31, 1917, metals sold realized £269,933 ($1,296,000). Operations cost £116,089 ($557,000), leaving a profit of £153,844 ($639,000). Balance at end of June was £283,491 ($1,363,000), and at end of 1917 £317,553 ($1,524,000). The financial position is exceptionally strong.

Dividends: two absorbed £120,000 ($576,000).

Development: progress amounted to 3820 ft., 20 ft. being done on 1370-ft. level. Of ore broken, 95% was by contract. Ore-reserves are estimated as 3,500,000 tons.

Production: ore dressed amounted to 69,390 tons, assaying 14.9% lead, 7.1 oz. silver, and 13.7% zinc. Metal recovery from all processes—gravity concentration, flotation, and selective flotation—was 86.3% lead, 79.8% silver, and 80.5% zinc. Metal content of ore dressed was 10,356 tons lead, 491,561 oz. silver, and 9508 tons of zinc.

Costs: these totaled $7.54 per ton, mining costing $5, development $1.07, and concentrating $1.47 per ton. In the previous half-year costs were $6.65. The increase is mostly due to suspension of operations for 11 weeks through strikes. A new power-house is being erected, new electric hoist was installed at No. 3 shaft, and the Barrier Roaster Co. is erecting three De Sperlet furnaces to roast zinc concentrate for acid manufacture.

IVANHOE GOLD CORPORATION, LTD.

Property: one of the leading mines in Australia, at Kalgoorlie, Western Australia.

Operating Official: John McDermott, general manager.

Financial Statement: receipts in 1917 totaled £398,036 ($1,910,000). After paying for operations, taxes, depreciation, etc., there remained a profit of £106,092 ($509,000). The year started with a balance of £15,578 ($74,900), and ended with £7858 ($38,000). Investments are valued at £158,038 ($758,000).

Dividends: four absorbed £105,000 ($504,000), making £3,670,000 ($17,620,000) since 1899.

Development: to a depth of 3620 ft. vertical there was 3867 ft. of work done, also considerable diamond-drilling. Reserves blocked out amounted to 1,035,874 tons, averaging $8.20 per ton, a slight increase in tonnage, but decrease in value. This estimate is to the 2420-ft. level. Further sinking below 3635 ft. has been stopped pending discovery of pay-ore at and below 2720 ft. In February 1918, drilling west on the 707-ft. level, 9 ft. of $8.16 and 8 ft. of $7.44 ore was found. This is now being opened.

Production: the 100 stamps, grinding-pans, tube-mills, sand, slime, and concentrate plants treated a total of 233,719 tons of ore, yielding 91,403 oz. fine gold. This makes a total of 3,692,869 tons and 2,114,213 oz. since 1898. Extraction in 1917 was 87.29%.

Costs: these totaled $5.48 per ton, including $2.56 for underground work, and $2.20 for treatment.

Book Reviews

Metallurgists and Chemists' Handbook. Second edition. Compiled by Donald M. Liddell. Pp. 656. Ill., index. McGraw-Hill Book Co., New York, 1918. For sale by 'Mining and Scientific Press.' Price, $4.

Two years ago we reviewed favorably the first edition of this pocket-book. The new work has been revised and enlarged by the addition of 53 pages. A new chapter on organic chemistry—the common compounds—covers 7 pages. The section on alloys now includes chromium, ferro-manganese, high-speed steel, insuluminum, nickel and cobalt, non-corrosives, shell steel, and cast projectiles. Some data are given on the principal toxic gases, which the author says are given "because of the growing 'popularity' of the compounds in warfare." The chapters on chemical data; sampling, assaying, and analysis; cyanidation; and fuels and refractories have been added to slightly. The notes on flotation and cyanidation are practically as before. Metallurgists and chemists should find this a handy reference.

A Handbook of Briquetting. By G. Franke, translated by Fred. C. A. N. Lautsberry. Two volumes, each complete in itself. Vol. II, Briquetting of Ores, Metallurgical Products, and Similar Material; 4 plates, 79 ill., index. Pp. 214. Griffin's Metallurgical Series. J. B. Lippincott Co., Philadelphia, 1918. For sale by 'Mining and Scientific Press. Price, $4.50.

This is a brief but authoritative presentation of all the European methods in use today for the briquetting, sintering, and agglomeration of metallurgic products in preparation for further treatment. The special adaptations of the processes described are given in the text, and a valuable summary is provided in tabular form, classified as to method, name of originator of the process, and the principles applied in effecting the consolidation. The experience at various plants is given in terms that admit of working out the economies that may be obtained under different costs of labor and supplies. As indicated before, the treatise does not cover the distinctly American methods, the author apparently not having had access to the details. While this limits the scope, it nevertheless possesses the value of giving elaborate data concerning a great variety of methods not widely known in this country, and will therefore prove suggestive and stimulating to American engineers. It is interesting to note that an American practice of agglomerating fines and flue-dust with hot convertor or reverberatory slag, which originated simultaneously in several plants managed by American engineers about twenty years ago, is credited to a German. The book should make a wide appeal at the present time when conservation is so highly important.

INFORMATION FURNISHED BY MANUFACTURERS

THE FEDERAL SIREN

The Federal siren is an electrically operated sound-signaling device which has been developed to supply the demand for a sound-signaling apparatus in small towns, mining communities, factories, and the like. The electric siren has a distinctive sound that cannot be confused with any other kind; its peculiar tone graduating up and down the scale makes it effective and especially adapted to mine, mill, and smelter operations. It cannot be confused with engine, locomotive, and steam-whistles; it is penetrating and is different and unmistakable. Government cantonments, aviation fields, and shipbuilding yards are equipped with Federal sirens, as are also numerous mines and factories throughout the country. The Federal siren is operated by an electric motor contained in the siren itself, and is sturdily built to withstand all conditions of climate and weather. The throw of a switch, which can be in any convenient place to suit the purpose, is all that is necessary. The operation is instantaneous, starting with a low growl and gradually increasing to a shrill pitch and a wierd cry that cannot possibly be confused with any other whistle or signaling device. The Federal siren is manufactured by the Federal Sign System, Lake and Des Plaines streets, Chicago.

COMMERCIAL PARAGRAPHS

The National Carbon Co., Cleveland, Ohio, will build a new plant at Clarksburg, West Virginia, for the production of carbon.

The Electric Steel & Forge Co., East 61st street, Cleveland, Ohio, is considering the construction of a new plant at Newburgh Heights to cost about $200,000.

The Lakewood Engineering Co., manufacturer of construction plant and industrial haulage, announces the opening of new offices at Chicago in the Lumber Exchange building.

The Chas. T. Topping Machinery Co., of Pittsburgh, Pennsylvania, has merged its interests with the Pittsburgh office of the Lakewood Engineering Co., Cleveland, Ohio, manufacturer of construction plant and industrial haulage.

The Consolidated Refining Works, 201 Mulberry street, Newark, New Jersey, has filed notice of organization to produce and deal in metals. Samuel Johnson, 133 Elm street, heads the company.

The Globe Manganese Copper Co., of New York, has been incorporated with capital of $500,000 to operate manganese and copper properties. John Kasser, Edward C. Curnen, and Alexander L. Lindsay, New York, are the incorporators.

The Wheeling Pulverizing Co., Wheeling, West Virginia, recently organized with a capital of $25,000, is planning for the operation of a local mineral pulverizing works. S. J. Windsor and O. W. Leonhart, Wheeling, head the company.

The International Feldspar Co., Middletown, Connecticut, has disposed of its holdings at Maromas, near Middletown, to the New England Potash Co., Hartford, Connecticut. The new owner is planning for the erection of a 10-unit plant for the production of feldspar by-products.

A new blast-furnace with capacity of about 600 tons will be constructed by the **Phillips Sheet & Tin Plate Co.**, Weirton, West Virginia. It is also planned to erect new by-product coke-ovens; the battery will comprise about 45 ovens.

Armour & Co., Chicago, Illinois, are planning for the construction of a large plant near Columbia, Tennessee, for the production of phosphate. The mining plant, to be operated in the name of the **Armour Fertilizer Works**, is estimated to cost over $100,000.

The Crittenden Mining Co., of Marion, Kentucky, recently incorporated with a capital of $100,000, is planning extensive operations on fluorspar properties. Machinery for the initial works is now being purchased. E. G. Stribbling will be manager of the company.

The Lafollette Coal & Iron Co., Lafollette, Tennessee, has acquired a large iron-ore property near Sugar Valley, Georgia, and plans to install machinery and equipment to develop the land. The tract comprises about 1000 acres and immediate development will be undertaken.

New electrical machinery, mining screens, and auxiliary apparatus, coal-cutting machinery and other equipment will be installed by the **Black Raven Coal Co.**, Willard, Kentucky. The company is planning for a production of about 1000 tons of coal daily. W. H. Norris is general manager.

The Empire Metals Corporation, Gloucester City, New Jersey, has been incorporated with a capital of $500,000 to operate a metal-recovery works. Elmer J. Shinn, Gloucester City, Herbert L. Maris, Philadelphia, Pennsylvania, and William J. B. Roop, Kirklyn, Pennsylvania, are the incorporators.

Preliminary plans have been prepared by the **T. H. Symington Co.**, Rochester, New York, for a new ammunition works to be located at Chicago, Illinois. The plant will include a number of buildings and represent an aggregate cost of over $5,000,000. A. B. Austin, Cutter building, Rochester, is engineer.

The Standard Sulphur Corporation, Detroit, Michigan, will soon commence the operation of a new plant near Orla, Texas. The company has property consisting of over 4000 acres of sulphur lands in this vicinity and the new works will have an output of from 100 to 125 tons of refined sulphur per day. Alfred F. Pudrith, of Detroit, is president of the company.

The Union Smelting & Refining Co., Newark, New Jersey, has commenced operations at its new plant at Avenue L and St. Charles street. A large department has been provided for 12 furnaces for smelting and refining. The structure includes hydraulic-press department, mixing-room, and solder works. The new plant will produce babbitt metal, solder, and the like. The smelting and refining works will be used, in part, for the recovery of tin. The plant, when complete with machinery and equipment to be installed, will represent an investment of about $500,000.

How to judge a ball-mill--

First learn the price of the mill, the price of the lining, the weight of the mill and the weight of the lining.

Next how long the lining will last, and—most important—how many pounds of balls are consumed per ton of ore ground.

Then with all the weights, calculate the freight charges added to the first cost and compute the cost per ton output.

Comparison will show that, for equal tonnage

The Hardinge Conical Mill

will cost you less installed in your plant and the cost per ton for milling will be appreciably under that for any other means for reduction.

The Proof Is Shown by Repeat Orders

NOTES 401

KILLING THE WAR MINERALS BILL 402
Henderson bill as a Senate substitute for the House bill may be agreed to in conference; would fail to promote general development of minerals needed; is useful to the rich, but valueless to the man of small means; hence is undemocratic; active production stimulated by requests from Washington under expectation of protection in the market; results represent a waste of effort; if more minerals not needed War Industries Board has sufficient authority. M. & S. P., September 28, 1918.

GERMAN CHEMISTRY IS NOT GERMAN 403
The Germans have always acquired the knowledge of more highly developed nations as a source of power to conquer them; they learned the arts from Rome for that purpose; they learned their science from Italy, France, and England, and never discovered a single fundamental law of physics or chemistry; the new spirit of science will be taught by the Allies. M. & S. P., September 28, 1918.

FLOTATION AT BROKEN HILL 404
Development of flotation processes at Broken Hill by Messrs. Delprat, Horwood, Bradford, and Henderson; the Delprat process ante-dated Minerals Separation patents; survival of CO_2 in flotation; principles and methods of selective flotation developed at Broken Hill. M. & S. P., September 28, 1918.

DISCUSSION

WESTERN MINING AND RELIGION
By F. C. Brown 405
Respect for religion inherent in the miner; conditions in Western mining camps destructive of the religious life; home life promotes religious development; the evil of Sunday work; "Where your treasure is there will your heart be also"; the War opening our eyes to the need of higher things. M. & S. P., September 28, 1918.

ARTICLES

THE BRADFORD PROCESS AT BROKEN HILL
By Edwin T. Henderson 407
Bradford process has treated 3000 tons of slime per week since 1916; outline of the plant at the Broken Hill Proprietary mine; regulation of the acidity, density, and temperature; description of the agitators; application of SO_2 in the agitators; the separating-box; method of treatment and selective flotation of the zinc and lead minerals; method of mill-control; assay of feed, concentrate, and tailing. M. & S. P., September 28, 1918.

GOLD FOR INDUSTRIAL USE 410
Order of the Treasury Department regulating the sale of gold for use in the arts. M. & S. P., September 28, 1918.

Let Us Help You Serve Effectively

Service is vitally necessary in business today that we may pull together to accomplish our common aim.

The General Electric Company has located industrial power experts at all large cities in this country to serve industry's electrical requirements. For instance, experienced textile mill electrical engineers will be found in all textile centers. Among other industries so served are the iron and steel, coal and metal mining, cement, clay and glass, lumber and woodworking, grain and sugar, canning, packing and refrigeration, shoes and rubber, paper and wood pulp, tobacco and cigars, chemicals and gas, and the construction and shipbuilding.

These experts are prepared to cooperate with industrial engineering firms to show the best way to drive a machine or a factory to get maximum production of highest quality at minimum power cost.

Back of these experts is the experience gained in supplying much of the electric power equipment now used in American industry and a corps of scientists with research facilities for pioneer work.

Call on us to help perfect your service to American business.

GENERAL ELECTRIC COMPANY

General Office, Schnecetady, N Y. . Sales offices in all large cities.

43-43

BY an oversight the article on 'Decanting' by Mr. H. Tillisch, published elsewhere in this issue, has not been credited as it should have been to 'The Journal of Industrial and Engineering Chemistry'. The suggestion is a useful one for operators in a laboratory, offering a simple means for hastening the settling of fine precipitates. The utilization of the same principle for settling pulp gives pertinence to the discussion.

CRITICISM is being made in Congress on the wasteful use of paper in the offices of the Federal Government at a time when publishers are being severely disciplined in this regard. The criticism is justified; we receive duplicates of Government bulletins and circulars; but other agencies for publicity are even more culpable; the postman brings us Crop Reports, Coal Mining Fabulities, and other matter that does not interest us in the least. Some of it continues to come after we have requested a discontinuance. At the present time the growth of publicity for all sorts of pseudo-war activities is immense, consuming recklessly a great deal of paper. We get all the scribbling-paper we need from such sources, using the back of the sheets, instead of consigning them to the waste-paper basket.

NEVADA is a great mining region, as we all know, but it is more than that, it is an intensely patriotic State; therefore it has become so angered by the tone of the Hearst press that the State Council of Defense has passed resolutions calling upon all news-dealers to abstain from selling "the Hearst publications" under threat of being "deemed guilty of disloyalty." Other counties and municipalities in Nevada, Oregon, and California have taken similar steps, and we rejoice to hear of them. It is high time for all good citizens to realize what a bubonic plague of journalism W. R. Hearst has brought upon the many communities in which he publishes his papers. These include ten newspapers, not to mention the defunct 'Deutsches Journal', which was discontinued on April 21 of this year; also seven magazines. According to the 'American Newspaper Annual and Directory' his newspapers have a total average daily circulation of 2,572,885, and his magazines a total average circulation per issue of 2,281,627. His influence for evil is potent and pestilential, so much so as to raise the question whether, in a democracy, it is not desirable to prevent any one man from controlling more than one paper, because the influence exerted by a man of poor character, by mere multiplication of the agencies for disseminating misinformation, is so great as to be contrary to the public good. Meanwhile, it is well that self-respecting communities should protest against the distribution of publications that poison the public mind and pervert the right thinking of the young, particularly in days like these when the Nation has committed itself to a great cause and a noble enterprise.

MR. GOMPERS seems to be leading organized labor more definitely than ever into constructive ways. Thus he shows how completely Germany miscalculated in her belief that labor would threaten our political stability and force acceptance of an inconclusive treaty of peace. This is so indicative of industrial peace, both internal and international, that we may overlook the doctrines that he preached only a few years ago. Likewise the French forgot and forgave M. Aristide Briand for hasty words spoken before he too had become one of the master-builders of a strong social structure. The more radical, who had not learned the value of social evolution as opposed to the wild dream of disintegrating society first and then trying to make it over according to schemes evolved from the finite wisdom of self-appointed reformers, dubbed M. Briand a conservative; likewise there are some who would apply that criticism to Mr. Gompers. As a matter of fact, authority and responsibility have taught both these leaders the value of centuries of social progress; they have discovered that there has not been lack of wisdom in the past, and that the laws under which we live and prosper may not be lightly cast aside. Law is the outcome of custom developed through the determination of men to live together co-operatively instead of retaining the prehensile tail that each may cling to his individual and personal tree. The British Labor Party gave all believers in our civilization a severe jolt when it adopted a platform that meant the discard of things as they are and the substitution of a new and untried system of ultra-collectivism. Mr. Gompers, however, visits England, and the Inter-Allied Labor and Socialistic Conference, a convention of workers in Great Britain and the United States, under his inspiration accepts the

principles of the French socialists in place of the extreme radicalism of the 'Platform of the Four Pillars.' The social doctrines proposed in the new resolutions admit of rational discussion because they rise to the level of principles that conceivably may be capable of international application. This is not to say that we accept them as they stand, but we recognize that they include material that may enter into a social foundation. That is what the world is seeking. For example, it is proposed that the treaty of peace should contain new definitions of civic rights, among which are these: The labor of a human being is not a commodity nor an article of commerce; involuntary servitude is not permissible prior to conviction for a crime; child labor shall taint the product as contrabrand; the basic work-day shall be limited to eight hours. The common factor in all these is the element of wholesome personal service as the expression of the individual will in a creative effort, to be rated above the concrete commercial result of labor. There is something to be said for that. It is the cornerstone of a philosophy that, incidentally, was involved in the doctrine preached in Palestine nineteen centuries ago, but was not always interpreted rightly. The principle and the practice need to be harmonized with skill and wisdom. We may anticipate the growth of right thinking and clear seeing when social principles so essentially constructive are substituted for those that mean the subversion of all the individual habits and predilections that have come down to us by instinct and inheritance.

ON September 19, Mr. J. R. Geary gave an interesting talk on Japan before the Engineers Club of San Francisco. The speaker had lived in Japan as representative of the General Electric Company for 15 years, and was well qualified therefore to give first-hand information. He did it in an agreeable and convincing manner. Mr. Geary took pains to disabuse his hearers of the insinuations against Japan circulated by German propagandists and by a certain group of disreputable papers in the United States. He laid stress on the fact that the trade relations of this country with Japan were such as to promote a friendly exchange and that the political aims of the two countries were concordant. His own experience in joint business with the Japanese had been most satisfactory, whether as the representative of a minority or a majority interest in corporate undertakings. The Japanese, he said, were astounded at the spirit shown by the United States in the War, by the idealism of motive and the effectiveness of action exhibited by our people; they admired these manifestations of the national morale and were heartily in sympathy with us. Much as they might, and did, admire the German military performance they reprobated the manner in which the Germans waged warfare, having themselves ideas on 'playing the game' a good deal like ours. Japan relatively is a small country lacking in the raw materials of manufacture but inhabited by a clever, energetic, and ambitious people; no need exists for friction or misunderstanding with our people, provided the German propagandist is prevented from misrepresenting the facts. We share Mr. Geary's belief that the Pacific Ocean will be true to its name and serve to promote friendly dealings between the United States and Japan, if only pro-German mendacity be silenced.

Chrome

On September 23 the War Industries Board issued a statement saying that "a new survey of the chromite situation meeting this week gives every indication that the tonnage of domestic chromite produced during the balance of this year can be sold at the average price prevailing this summer; if unable to find a ready market for ore wire this office giving tonnage and guaranteed analysis and price." Moreover, we understand that the plan adopted by the War Industries Board is to ensure a production for the first eight or nine months of 1919 at the same rate as during the corresponding period of 1918. There is nothing in the outlook to justify putting new capital into the business; in short, those that have proceeded to mine chromite under Government guarantee will be protected; that is all. We defer further comment, but we will say this: it is evident that the representatives of the Government have been placed in an awkward position by the greed of those in the ferro-alloy industry and that the making of money by them has been allowed to check the effort to stimulate the production of a mineral needed for the successful waging of the War. It is quite evident that a real War Minerals administrator is urgently required.

Killing the War Minerals Bill

Reports from Washington indicate that the House may agree to the so-called War Minerals Bill in the emasculated form in which it has issued with the inprimatur of the Senate. The man in the country is superciliously informed these days by the man at Washington that he knows nothing of the real needs of the Government, and the implication is that unless the superlative wisdom of the great Washington hive be conceded there is likelihood of being stung for our disagreement. We are not prepared to say that the Henderson substitute for the essentially sound and democratic Bill that was passed by the House will fail to supply the Government with all the manganese, chrome, tungsten, sulphur, and other minerals that it needs. Quite likely, to judge by the excellent way things are being done at the front and on the seas by the competent part of our national organization, to wit, the Army and Navy, the supply of these minerals, even in the haphazard fashion of committee administration, may prove sufficient to keep us from absolute embarrassment. There was a time when the country was alarmed by the reports from Washington; when every man was urged, as a patriotic duty, to get out and dig manganese, to scour the serpentine hills for chrome, to go into the gulches and wash gravel with a special eye to

recovering platinum. The people responded: they felt that they were doing a service equivalent to buying Liberty Bonds or making donations to the Red Cross when they flung their money into prospecting for these minerals at the behest of Uncle Sam. They expected, of course, that it meant so much to him that he would protect them against the wastage of their time and money. To put five thousand dollars into a manganese mine because the Nation needed the manganese and then have the Nation decline to accept his product at a price that will permit him to mine and ship it, is precisely like the urging of people to raise potatoes and beans, and then to leave them unprovided with either transportation or market after they have made their patriotic answer with work performed. It is not the sacrifice that hurts so much as the utter indifference to the fruit of the service. A man would have felt that he was really helping, like a good soldier, to whip Germany, if Uncle San had hauled off his potatoes to feed the Army, though he might have left only a due-bill in his hands, to be paid at the whim of some future Congress; but to be told to raise potatoes and then see them rot in the soil stirs bitter thought. When you waste a man's service you do worse than rob him. The same sort of thing has happened in the mineral industry. There was a veritable panic at Washington to release ships, and therefore to hurry the development of our own mineral deposits so as to relieve us from dependence upon foreign resources. The response was prompt and generous. It was the most speculative kind of mining that the people were asked to undertake; some achieved a modest financial return; most have lost money; and the promised bill to guarantee their market, in which they found encouragement to go on, has now been smashed. They had reason to expect that the bill would be amended, but not that it would be thrown overboard and a radically different one introduced that favors only the rich, and, in its operation, keeps the poor man from obtaining an outlet for his ore. To inspire a man to produce anything, potatoes, chrome, beans, or manganese, and then leave him without means to market it, is economic waste. The money had better been given to the Red Cross, where it would have done some good; the man's service had better been commandeered for building ships, so that he really would have helped to send soldiers across the seas to strengthen the battle-line. Under the Henderson bill a man must first interest a bureau or administrative committee, or whatever official the President may choose to subrogate for his official person in contracting for the output of a mine, or in arranging to take it over to be operated on some basis for compensation by the Government. The Bill was printed in full in our issue of September 14. Some of the Senators, realizing that it might be difficult and expensive for the ordinary prospector away off in the Sierra Nevada to go to Washington and wait around the hotel lobbies until he could obtain audience with those appointed to administer the Act, suggested that a bureau be established somewhere west of the Mississippi for the greater convenience of the miners. Even so, it interposes a bureau between the citizen and the Government that he wants to serve. There is nothing that the plain democrat hates worse than bureaucracy, because it is not democratic. The House bill was essentially a people's bill, for the good of the people and the Government that they create; the Henderson bill is for those that can get the ear of bureaucrats. If the House wishes to demonstrate that it is a truly representative body, it will reject this mere pretense of a war-minerals bill sent to it from the Senate. We may as well have no bill at all; it were better to leave the whole business in the hands of the War Industries Board. If we really need a great increase in the output of the minerals mentioned in the bill, then we require a measure that will enable the host of willing prospectors to produce and ship their ores; if we do not, then the passage of this bill, which admits of exclusive contracts at agreed prices without affording a competitive market, is to be condemned for the abuses that are possible under its terms. If we do not need to stimulate the industry, then it is evident that the powers vested in the War Industries Board are sufficient for providing the mineral products needed by the Government.

German Chemistry is Not German

Many years ago an American youth wrote to Dr. H. A. Green, then eminent as a lecturer on geology in the University of London, asking advice regarding a technical course, either in England or in Germany. The reply was significant: "Stay in America; you can get as good an education there as anywhere in the world, unless it be in France; above all, don't be misled by the boasts of the Germans; they give a finished course but not a developing one." The prime defect in the German character is revealed by Dr. Green's criticism: they do not originate. From the earliest times the Teutons have been ready to adopt the science of the nations whom they strove to conquer. During the centuries when the barbarians were pressing upon the cultured nations of the South, they were accustomed to send their sons to be educated at Rome, and the Romans, believing that the spread of civilization would promote the peace of the world, welcomed and coached them. The invasions that followed show that ideas of culture and development never penetrated their minds; that their use of Roman culture was merely to give them conquering power. Quickly the medieval and modern Germans learned the secrets of Nature from the Italian physicists, from the French and English chemists, but instead of seeking new understanding by which man might control the forces of the universe, they proceeded to develop intensively the commercial application of science for control of the world. Their students thronged the schools of France until they thought they had mastered the fundamentals. Pure science has never been their beacon; it was only the glitter of gold and the attraction of world dominion that led them on. Among them is no counterpart to a Dalton, a Faraday, a Gay-Lussac. We have mentioned before the striking fact that no German has discovered a single fundamental law of

science. On another page we reproduce a notable article by Mr Townes R. Leigh, reviewing the development of the natural sciences, and showing how completely Germany has borrowed her chemistry from the progressive nations now allied for defence against her as their common enemy, convinced that the safety of civilization necessitates the destruction of this inveterate Teutonic marauder. The work of four years has shown that even while distracted by the scramble of preparation for war, the French, the English, and the Americans have been able to advance the practical application of chemistry almost as far as the Germans had done in decades of quiet research. We and our Allies have declared independence of the German universities, and henceforth will teach the arts as well as the sciences in a spirit far different from that of the materialists of the North. The whole trend and purpose of civilization is toward a spiritual uplift, and the gross uses of science, in the hands of the Germans, lacked that quality utterly. It is under the impulse of lofty idealism that great forward strides are possible. A nation or a race can rise no higher than its philosophy. The Germans have evolved only philosophies of negation and of finite limitations, in which the genius of human sympathy and development finds no nourishment. Mr. H. G. Wells said recently, "Germany has never been superior to any one of her antagonists; she has merely been more heavily organized for the exploitation of technical science, and with a vastly greater number of workers therein." The hope of civilization lies in the group of people now banded together to save mankind from the barbarian that has menaced human progress since the first horde levied tribute upon Rome 2300 years ago.

Flotation at Broken Hill

In our last issue we published an article on the development of the flotation process at Broken Hill, Australia, and in this issue we give our readers another, by the same author, on the Bradford process as developed and used at the Broken Hill Proprietary mine. Both these articles come from the pen of Mr. Edwin T. Henderson, metallurgist to the Broken Hill Proprietary Company. We owe the initiative in the publication of this valuable technical information to Mr. G. D. Delprat, the general manager of the company, who persuaded Mr. Henderson to do the writing, being himself too fully occupied to undertake the task. However, we are in a position to say that the articles are authoritative in the fullest sense, because Mr Delprat revised them, and he accepts full responsibility for them. He himself finds only one fault with the articles, and that is the modest place that the author claims for himself in the development of the metallurgical practice, which owes its success, so says Mr. Delprat, principally to Messrs E. J. Horwood, Leslie Bradford, and E. T. Henderson, which trio we shall make into a quartette by adding the name of Guillaume Daniel Delprat, the inventor of the process that bears his name and the general manager for the mining company that adopted the flotation methods devised by those whose names we have just mentioned. In truth, we have had far too little information concerning the technique of flotation at Broken Hill, the locality with which is associated the incubation of the process in its early stage of development. Moreover, to the metallurgists working at Broken Hill, notably at the Proprietary, which is the parent mine of the district, we must credit many of the improvements, particularly those applying to the differential treatment of the sulphides of zinc and lead in complex silver lead ores. It will be noted that the successful use of flotation, by the Delprat process, ante dated the Minerals Separation 'discovery' by two years. It is remarkable that the use of carbon di-oxide gas, as the agent of levitation, generated by the reaction between sulphuric acid and the carbonates in the ore, should have survived the competition of later methods, in which air creates the bubbles required for floating the sulphide particles. Whether air assists the other gas in the Delprat process is not stated. Mr. Henderson testifies emphatically that no oil is used, and quotes a decisive experiment to prove it. The fact that the Delprat process was not effective on slime led to the researches of Messrs. Bradford and Horwood, both of whom were successful in devising new methods, particularly of the selective kind, facilitating the separation of the galena from the blende, and thereby producing a marketable zinc concentrate as well as a cleaner lead concentrate. The roasting of the galena to a sulphate, thereby rendering it unfloatable, so that the associated blende or pyrite can be floated separately, is the chief feature of the Horwood process, which has proved effective on the ores not only of Broken Hill but of Tasmania also. The use of sodium sulphate as a frothing-agent was invented by Mr. Bradford for the flotation of the blende in the roasted complex ore. Indeed, Mr. Bradford devised so many successive improvements that one had hardly been put to the test on a working scale before he came forward with another. It will be noted that, according to Mr. Henderson, this research was guided by the hypothesis that the non-wetting of the sulphides is due to the protection of a film of air, and that one kind of sulphide could be selectively floated in the presence of another if a salt were introduced capable of removing the film of air on one sulphide without affecting the air on the others. A solution of common salt is one of Mr. Bradford's frothing-agents; he adds a little acid, and thus fails to reproduce the sea-water experiment. Another of his differential methods is to displace the air on the surface of the sulphide particles by means of sulphur di-oxide gas, generated from sodium hyposulphite added to the pulp, thereby checking the tendency to flotation, and producing a cleaner concentrate. In his second article Mr. Henderson gives a detailed description of the Bradford process and furnishes hints that should prove of the utmost value to American metallurgists. In their behalf we thank him, the staff of the Broken Hill Proprietary Company, and Mr. Delprat, for their courtesy and fraternal spirit in enabling us to publish this information.

Western Mining and Religion

The Editor:

Sir—Mining communities and camps in different parts of the world have different characteristics, and what has often struck me in connection with our Western camps is the apparent indifference to religion, if one judges from outward signs—I make this proviso, because I have often noticed that deep down in many a rugged and time-worn miner's heart there is a true respect for religion.

Some years ago, a few of us started Sunday-evening meetings in a Western mining camp, and these meetings were remarkably well-attended. The singing of the old hymns was the strong feature of the meetings, the audience being called upon to choose their favorite hymns. Many a time I have seen an old prospector tremblingly ask for a certain number, and have watched the tears course silently down his cheeks as the old memories were brought back by hearing the familiar tune—what a strange thing is memory, and how it links the present with the past. I am afraid the saying one often hears out here, that when a man from the East crosses the Rockies he leaves his religion behind him, is often only too true; so many come, lured on by the vision of getting wealth, and, like the fable of the dog and the reflection of the bone in the clear water, drop the substance and grasp at the shadow.

The general conditions at our Western mining camps do not encourage religious activities. As a rule a large proportion of the workers do not have their homes at the mine, and are there with the one object of making a stake, and in their blind pursuit of the fleeting dollar, God's laws, which are the only foundation of true prosperity, are often brushed aside. This is not only the case here, but in other countries, as is illustrated by the following incident: A man who had started mining as a trucker had risen to the position of underground superintendent at a large mine in Australia, and, of course, was very keen to hold his job. On a visit to the mine, I was discussing with him some features in connection with contract work, and he made a suggestion that to me seemed very unfair to the men, and my calling his attention to it elicited the following remark, "I am working for the Company and looking after their interests, and when I engaged with them it meant giving all my time and ability to their service." I said this seemed all right, but that a man had a soul, whereupon he remarked "Well, I am willing to throw that in." I have since watched this man, and although financially successful, I do not think that, if the correct meaning of 'success'—a prosperous termination of something attempted—be applied to his life, it would fit. Christ's injunction "Render unto Caesar the things that are Caesar's, and unto God the things that are God's" is one we should all ponder over, as a man will serve his employer better if he gives heed to it.

Not to have his home at a mine is a handicap to a miner, and has a tendency to put religion in the background, but a far more serious factor in stifling religion in our Western mining camps is the almost universal disregard of the Sabbath as a day of rest and spiritual refreshment. It seems so strange to me that Sunday work, which has been abandoned in most other countries under Anglo-Saxon rule, is still clung to here. God knew what he was about when he instituted the Sabbath, and when I see men going on and coming off shift on Sunday, it always reminds me of children who think they know more than their fathers. In discussing this problem with miners, their usual argument is that they prefer work to lying around on Sunday, especially as their board has to be paid just the same that day; and the superintendent's attitude is that as the men prefer to work on Sunday, he sees no reason why they should not. This, of course, is weak, as in most other things he does not allow them their own choice. The 'Safety First' is now a familiar sign at most mines, showing some regard for a man's limbs, but he is left to look after his own soul, and not given much of an opportunity to do this.

I once took the job of superintendent of the sunday-school at a certain one-man camp, and arranged to have Sunday afternoon off. One Sunday, just before getting ready to go down to the school, I strolled over to the mill, where some experts were busy experimenting with a small flotation plant. I stood for some time watching their eargerness to make the thing go, and finally, looking at my watch, told them I had to be off to my sunday-school, jokingly remarking as I left them, "from the sublime to the ridiculous," but I have since often wondered which was the ridiculous.

Some years ago I was being installed by the directors of a company as manager of their mine, and I asked them plainly if they wanted the men to work on Sunday. The question seemed a little embarrassing, and as they hesitated to answer, I asked them what they did back in Iowa, where they lived. Of course, they said they went to church et cetera on Sunday. The upshot of the discussion was that the question of Sunday work was left to me. At first the men did not like laying off on Sunday although the company paid them their board for that day, but after the first three or four Sundays a

science. On another page we reproduce a notable article by Mr. Townes R. Leigh, reviewing the development of the natural sciences, and showing how completely Germany has borrowed her chemistry from the progressive nations now allied for defence against her as their common enemy, convinced that the safety of civilization necessitates the destruction of this inveterate Teutonic marauder. The work of four years has shown that even while distracted by the scramble of preparation for war, the French, the English, and the Americans have been able to advance the practical application of chemistry almost as far as the Germans had done in decades of quiet research. Not to have his home at a mine is a handicap to a miner, and has a tendency to put religion in the background, but a far more serious factor in stifling religion in our Western mining camps is the almost universal disregard of the Sabbath as a day of rest and spiritual refreshment. It seems so strange to me that Sunday work, which has been abandoned in most other countries under Anglo-Saxon rule, is still clung to here. God knew what he was about when he instituted the Sabbath, and when I see men going on and coming off shift on Sunday, it always reminds me of children who think they know more than their fathers. In discussing this problem with miners, their usual argument is that they prefer work to lying around on Sunday, especially as their board has to be paid just the same that day; and the superintendent's attitude is that as the men prefer to work on Sunday, he sees no reason why they should not. This, of course, is weak, as in most other things he does not allow them their own choice. The 'Safety First' is now a familiar sign at most mines, showing some regard for a man's limbs, but he is left to look after his own soul, and not given much of an opportunity to do this.

I once took the job of superintendent of the sunday-school at a certain one-man camp, and arranged to have Sunday afternoon off. One Sunday, just before getting ready to go down to the school, I strolled over to the mill, where some experts were busy experimenting with a small flotation plant. I stood for some time watching their eargerness to make the thing go, and finally, looking at my watch, told them I had to be off to my sunday-school, jokingly remarking as I left them, "from the sublime to the ridiculous," but I have since often wondered which was the ridiculous.

Some years ago I was being installed by the directors of a company as manager of their mine, and I asked them plainly if they wanted the men to work on Sunday. The question seemed a little embarrassing, and as they hesitated to answer, I asked them what they did back in Iowa, where they lived. Of course, they said they went to church et cetera on Sunday. The upshot of the discussion was that the question of Sunday work was left to me. At first the men did not like laying off on Sunday although the company paid them their board for that day, but after the first three or four Sundays a

change was noticeable, and they began to look forward to the day off and to plan ahead how to spend it. I found that it was, after all, a matter of habit—they had been so long accustomed to work on Sunday that they actually did not know how to spend it in any other way. If a condition like this is not a reproach to our system, I would like to know what is.

I was recently at a mine back in the hills, and we heard over the telephone that a church service was to be held the next Sunday at a small town about four miles distant. Two of us decided to attend, and drove down in a two-ton auto-truck, certainly a formidable vehicle to go to church in. We found about 18 ladies present and one man, and afterward found that the man had driven in with the preacher. We were a bit late, as our chariot was not as swift as we expected, and I noticed how the poor preacher perked right up when he noticed two real men in his audience.

If we go back 100 years or so, we find religion was indeed a man's job, and this was especially the case in this country. Now men have so many important things to do on Sunday, that everything in connection with church and religion falls to the woman's share. I think men should at least find time to take some interest in sunday-school work, as this is now about the only means our children have of becoming acquainted with those vital things our forefathers sacrificed so much for. If a father can find no time on Sunday for religious activity he can hardly expect his boys to do so.

It always seems to me that mining, especially prospecting, should develop faith, and that this should ultimately reach out and find God, but it so often has just the opposite result, because the gold and silver, instead of being made a means to an end, are made the end themselves. Many years ago I was in charge of a small assay-office far back in the mountains, and one rainy afternoon a prospector knocked at the door, and upon my admitting him, asked if I could run a sample. I told him I would do this and that he could wait while I put it through, and asked him to be seated. I noticed that he seemed nervous, and after a while he explained why he was so anxious about the sample. He said he had been five years driving a tunnel to cut his vein, working alone all the time, and that he had just cut it, five feet wide, and if the sample ran well he was a 'made' man. I put the sample through the bucking process, then into the crucible, and the resulting lead button into the cupel, explaining each step to the prospector as I went along, little dreaming what an ordeal I was to put him to. As I put the lead button into the cupel I told him that the lead would be absorbed, and that if the ore contained silver or gold it would remain as a small bead on the cupel. He stood in front of the red-hot muffle, peering in as though looking for a lost soul, and some time before the 'blick' came, my experienced eye told me the sample was very low-grade. I was busy at some other work when I suddenly heard an anguished cry, "Why, it is all gone," and the prospector sank to a seat, trembling and sobbing as though his heart would break. Of course, one will say he was a weak man, but still he had grit enough to work five years alone, impelled by his vision of fortune—how true are Christ's words "Where your treasure is, there will your heart be also."

"Surely there is a vein for the silver, and a place for gold where they find it," and if those engaged in digging the precious metals and bringing them to the light, could only realize that the losing of a sense of need and appreciation of God is not progress, notwithstanding what is said by some of our popular writers who are "ever learning and never able to come to the knowledge of the truth," but the most unfortunate condition a human being can come to, there would be time and opportunity provided for the development and nourishment of the spiritual side, and if one has even the smallest faith in God's promises, he would know that the industry, instead of suffering, would be more prosperous.

This terrible world's conflict should be a lesson to all of us. It is of no use merely saying "Germany started it," as the trouble is we are all in it, and each country is losing the prime of its young manhood. Is it possible that we have all been drifting away, and have broken down the hedge that God made about us for our protection, and that now He has allowed the sword to come into the land to open our eyes and to bring us back from the paths we were blindly following, and which lead to nowhere?

Our President, in his official proclamations, recognizes and lays stress upon the religious side of civic life, and I think we who are engaged in the so-called material occupation of digging for the precious metals, will do well to give heed to what he says.

F. C. Brown.

Quartzburg, Idaho, August 9.

[The prospector has been misled by the incorrect quotation of Job's words so often that it seems necessary to state that the Bible says "fine"—or refine—not "find". Job must have been in a cynical mood when he said that; he might as well have stated that there is gold in the mint. Mr. Brown, however, is quoting the prospector, not the Bible. We feel sure that what he says will appeal to many of his old friends in the hills and to those that go down the mine in skips.—Editor.]

Henry R. Merton & Co. In answer to a question in the House of Commons it was stated: The Metallgesellschaft formerly held a large number of shares in Henry R. Merton & Co., Ltd., but does not now hold any shares; the Australian branch of the company has been closed. The present directors of the company are S. Baer, H. Gardner, W. Gardner, O. Lang, E. R. Merton, and M. Wilson. German subjects have an indirect financial interest in the company through the holding of 11,857 shares by a Swiss company which is believed to be under German control. The company is not now doing any work for the Government. Under the provisions of the Non-Ferrous Metal Industry Act the company will not be able to trade in non-ferrous metals without a license, and in this case the Board of Trade has refused to grant a license.

The Bradford Process at Broken Hill

By EDWIN T. HENDERSON

Since September 2, 1916, the Bradford process has been in operation on the Broken Hill Proprietary mine, Broken Hill, treating approximately 3000 tons of slime weekly.

The greater part of this slime is obtained from old slime-dams, the remainder being made up with current slime from the ore-dressing mills.

The dump material is loaded into trucks holding 1750 lb. each, and hauled to the plant by horses. Each train consists of four trucks, one horse being able to haul this quantity comfortably. Two horses are kept going constantly.

As the trains arrive at the plant they are tipped into a hopper placed below the ground-level. As each truck is tipped a boy throws a shovelful of nitre-cake weighing about 8 lb. into the hopper as an emulsifying agent, and this passes on with the slime. Recent tests indicate that the mineral salts in solution in the plant-water are themselves sufficient for emulsification. No oil is used for flotation purposes in this plant.

This hopper has a six-inch opening running the full length of the bottom, and delivers the slime as tipped onto a 24-in. belt-conveyor traveling at 260 ft. per minute. This conveyor carries and elevates the slime to a mixer 8 ft. diam. and 6 ft. deep, having an arm (6 ft. diam.) revolving at 42 revolutions per minute in the bottom. Solution is added here, and the slime is mixed to a flowing pulp.

The discharge from this mixer is taken from one side, 18 in. from the bottom. The pulp flows in a box-launder to a tube-mill loaded with flints and making 7 r.p.m. The purpose is to break up any small lumps of slime that have escaped the first mixer.

A screen, 32 in. diam. by 2½ ft. long, made of punched trommel-plate having ⅛-in. holes, is bolted to the discharge end of the tube-mill. This screen is fitted inside with an Archimedean screw, which revolves with the screen and works any wood-pulp or rubbish that will not pass the holes to the discharge, where it falls down a chute and is removed from time to time.

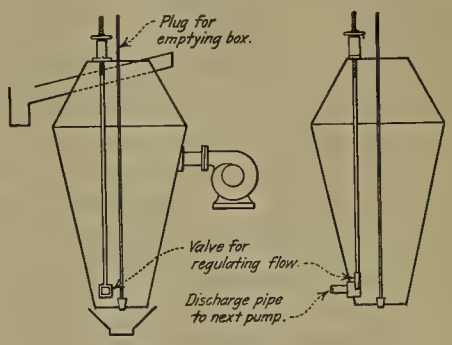
The pulp that passes through the screen flows in a launder to a storage-vat, 30 ft. diam. by 5 ft. deep. This vat is fitted with revolving arms, 26 ft. diam., made of channel-iron, with scrapers attached similar to a Dorr thickener, only set to throw toward the periphery. These arms make 3 r.p.m. and keep the slime in suspension.

The current slime from the mill, after being dewatered in a Dorr thickener, is discharged to this storage-vat. The pulp in this vat contains 50% solid.

The vat is discharged by means of a 6-in. pipe bolted to the side close to the bottom. A gate-valve placed close to the vat regulates the flow. This pipe takes the pulp to an elevator that delivers to a small mixer at the head of the plant. This mixer is 5 by 5 by 5 ft. and has an arm 4 ft. 6 in. diam. revolving in the bottom at 29 r.p.m. Clear solution from storage-vats is added here in sufficient quantity to break the pulp down to 25% solid by weight.

Sufficient acid is added to acidify the pulp, and sodium hyposulphite to the extent of 1.5 to 2 lb. per ton. The latter is made up to a 30% solution on the ground-level and pumped to a 400-gal. tank placed alongside this mixer. The flow is regulated by means of a tap, which is adjusted to deliver one pint in 40 seconds. The flow through the plant ranges from 20 to 25 tons of solids per hour.

From this mixer the pulp passes through two short



SKETCH OF SEPARATION-BOX

lengths of 6-in. pipe to a similar mixer placed on the same level alongside. The object of the mixer is to give the necessary time for the SO_2 liberated from the hyposulphite to wet the zinc sulphide.

The acidity, density, and temperature of the pulp are tested in this mixer repeatedly. The best work is obtained when the acidity is between 0.025 and 0.03, the temperature between 85 and 90° F., and the density between 23 and 26% solid by weight.

The density is obtained by filling a bottle made of tin and calibrated to hold 1000 cc. H_2O at 90° F. The density of the circuit-liquor runs at 1.05 sp. gr., and a table is fixed alongside the balance showing the percentage of solid corresponding to any weight of charge.

The discharge from this second mixer is through a 4-in. cast-iron pipe bolted to the side of the mixer, and about 6 in. above the bottom. A slide-valve is placed over the mouth of this pipe in the mixer, and this is adjusted by means of a screw, to give any desired flow. The pipe delivers to the suction of the first agitator of the lead section.

These agitators are of a special design. They are in

the form of a centrifugal pump and act in the same way, but give a much better agitation. The runner consists of a circular disc on the sides of which two rings of pegs project a distance of 1½ in. from the face; the runner is 17¾ in. diam. Lining plates are placed inside the casing of the agitator. The side plates have two rings of pegs similar to those on the runner. One of these rings fits between the two rings on the runner, and the other between the smaller ring and the centre. The suction-pipe is coupled to both sides of the casing, so that the pull on either side of the runner is balanced. A half-inch pipe is tapped into the suction on both sides of the casing, and these are joined up on top to an inch pipe, which is in turn coupled to a 3-in. main running along the top of the plant. This main is connected to sulphur-burners, to be described later. Through these pipes the agitators draw their supply of air and sulphur di-oxide.

The runner in the agitator revolves at 1080 r.p.m. The gas and pulp entering at the centre have to run the gauntlet through the revolving and stationary pegs on the runner and side plates, and the air is thoroughly broken up. Clear solution at a suitable pressure is delivered through half-inch pipes near each gland to prevent the grit coming into contact with the gland, and thus reduce the wear on spindles.

The agitator delivers through a 4-in. pipe into a separation-box (see sketch attached) where the lead sulphide floats and forms a froth 3 ft. deep, overflowing on top so as to pass to the main lead-concentrate launder.

From one side near the bottom of each separation-box a 4-in. cast-iron pipe leads to the suction of the next agitator of the series. A slide-valve fitted inside each box, and operated by an iron rod passing to the top of the box, controls the flow from one box to the next. The control of the flow of pulp through the agitator also regulates the amount of gas drawn in and incidentally the power consumed. The smaller the flow the greater the supply of gas and the smaller the power required, and the reverse.

There are nine of these agitators in the series, each drawing dilute SO_2 from the burners and delivering the agitated pulp to a separation-box where the lead floats off. Most of the lead is removed in the first four boxes, and after this the lead on each succeeding box becomes shallower, until at the ninth practically nothing remains, and it is allowed to overflow slightly. This overflow is returned to the head of the system.

It is found that the lead is cleaner if a small amount of acid is added to boxes No. 6 and 7; the solution has become neutral by this time, and the addition should be just sufficient to make it slightly acid. Steam is also added to the last four agitators to raise the temperature in No. 9 box to 90° F.

The agitators are driven in pairs by means of a belt from the main shaft, which in turn is belt-driven from a 250-hp. engine.

The discharge from No. 9 separation-box is through a 4-in. cast-iron pipe, fitted with a valve to control the flow. This pipe delivers the pulp to two 30 ft. Dorr thickeners, 10 ft. deep, which settle the zinc middling and give clear solution at a temperature of about 90° F. flowing to the solution-tanks at the head of the lead section.

The lead concentrate overflowing from these separation-boxes passes in a common launder to a storage-vat placed on the ground-level. This vat is 20 ft. diam. by 5 ft. deep, and is fitted with stirring-arms making 14 r.p.m., so as to keep the solid in suspension. The pulp in this vat contains 40% solid by weight, subsequently thickened in a storage-vat, 14 ft. diam. by 18 ft. deep, to 70% solid, whence it is pumped by means of a three-throw plunger-pump to filter-presses of the Dehne type; each press has 50 leaves, and the cakes are 3 in. thick.

The press holds 9 tons of lead concentrate. Two of them are required to press and dry the concentrate produced. The drying is done by blowing compressed air at 80 lb. pressure through the cakes for 30 minutes. The moisture is in this way lowered to 10%. The cakes, when dropped from the press, fall onto bars placed over a conveyor; this delivers its load to a second conveyor, which carries it to the bins.

The arms on the Dorr thickeners treating zinc middling make one revolution in 1½ minutes. The discharge from these, containing 60% solid by weight, is delivered to an elevator that lifts to an overhead launder running to two vats, 20 ft. diam. and 7 ft. deep, which act as storage-vats for the zinc section. These vats are fitted with revolving arms making 14 r.p.m., to keep the solid in suspension. Steam is blown into the pulp in these vats, and the temperature is thus raised to 125° F.

An elevator is placed between these two vats and they discharge to it, through 4-in. cast-iron pipes fitted with a valve to regulate the flow. These pipes are bolted to the sides of the vats and are about 2 ft. long. This elevator raises the pulp to a launder delivering to a small mixer 5 by 5 by 5 ft. at the head of the zinc section. This mixer has an arm 4 ft. 6 in. long revolving at the rate of 29 r.p.m. Here solution from the zinc section solution-tanks is added to break down the pulp to about 20% solid, and acid equal to 30 lb. per ton, to acidify the pulp to approximately 0.3%. The temperature of the pulp is about 125° F.

The discharge is through a 4-in. cast-iron pipe, fitted with a slide-valve in the mixer similar to the lead section. This discharge-pipe connects to the suction of the first agitator, which has a half-inch pipe tapped into the suction, and carried to the top of the separation-box. A plug-valve is attached to the end; the agitator draws air through this pipe, and is controlled by setting the valve. In order to make this adjustment easy, the plug in this valve is not tapered and the hole consists of a slot $\frac{1}{16}$-in. wide and half an inch long.

The agitators of this section consist of ordinary centrifugal pumps, the runners having three arms set at 60° and revolving at 960 revolutions per minute.

The separation-boxes are similar to those of the lead section, and the valves for controlling the flow are the same. There are six of these boxes. The agitators are driven in pairs by means of a belt off the main shaft; this shaft is driven by a 100-hp. motor.

The zinc floats rapidly. The head in the separation-boxes ranges from 36 in. deep in the first four to 18 in. in the fifth, and the sixth is kept overflowing slightly. This overflow is sent to the zinc-middling Dorr thickeners for re-treatment.

The acidity of the pulp as it discharges from No. 6 pan is kept at about 0.08%, as the tailing is cleaner with this acidity than with a lower one. The discharge from No. 6 pan is through a 5-in. cast-iron pipe to two 25-ft. Dorr thickeners 10 ft. deep; the arms on these make one revolution in two minutes. The overflow from these thickeners passes in a launder to the zinc-section solution-tanks, where it is kept up to temperature by having steam blown into it. The tailing-discharge, from the bottom, delivers to an elevator that raises it to a small box to which two lines of 4-in. piping are fixed. These pipes carry the pulp to the tailing-dams. Only one is used at a time, the other being kept ready in case of a choke. High-pressure water is connected to these pipes so that in case of their becoming blocked they can be readily cleared again.

The zinc concentrate overflowing from these separation-boxes pass to a common launder delivering to a small elevator. This raises it to a height sufficient for it to flow down a launder to the zinc re-treatment plant, where it is delivered into a small mixer at the head, similar to those previously described. Here it is diluted down to an 8% pulp and re-floated in three separation-boxes.

Everything in this plant is similar to that on the first zinc section, except that the agitators are direct-coupled to motors. The first two have a 30-hp. motor placed between them, and the third is coupled to a 15-hp. motor. Very little acid is required in this section, there being hardly any acid-consuming material present. The acidity of the pulp is kept at 0.1% approximately.

The discharge from the third box passes to a 25-ft. Dorr thickener 10 ft. deep; the arms on this make one revolution in two minutes. The overflow from this passes to a storage-tank from which it is pumped to the small mixer at the head of the separation-boxes. Steam is blown into the solution-tank in quantity sufficient to keep the temperature at 125° F. The discharge from the bottom of the thickener passes to the elevator taking the drainage from the first zinc-float section, and this delivers it to the zinc-middling thickeners for re-treatment.

The final zinc concentrate from the three re-treatment boxes flows in a launder to a vat on the ground-level. This vat, 20 ft. diam. and 5 ft. deep, is fitted with arms revolving at 14 r.p.m., to keep the solids in suspension. When this vat becomes full it is pumped out to the zinc-storage dams.

The floor under each section of the plant is concreted and faced with cement, and is in the form of a large spoon-drain. That under the lead section falls to an elevator, which takes any leakage with any material discharged from the bottom plugs of the separation-boxes, and returns them to the first mixer, from which it passes with fresh dump-slime through the tube-mill to the feed-storage vat.

The floors under the first zinc-float section and the re-treatment section both fall to a common elevator. Any leakage or discharge from the bottom plugs of these boxes passes to this elevator, together with the discharge from the re-treatment Dorr thickener, and are returned to the two 30-ft. diam. zinc-middlings Dorr thickeners. By this means any slime accumulating on the floor can be readily cleaned up by washing with a jet of water.

The sulphur-burners are of simple construction. They consist of two cast-iron pipes, 20 in. diam. and 10 ft. long, laid on the ground. The two ends are closed by means of pieces of boiler-plate secured by bolts. Through one end of each a hole 1¼ in. diam. is bored, slightly above the centre of the pipe; this hole is to admit air. The other end of each burner is coupled to a 3-in. cast-iron pipe into which the burner-gas delivers. This connection is made as near the top of the end plate as possible.

A 4-in. cast-iron pipe is coupled on to the top of each burner near the end that the air enters. This pipe supplies the means of charging the sulphur, and is kept closed by means of a piece of plate and insertion-joint held in place by two bolts. The 3-in. pipe passes to a receiver made of cast-iron. This is 3 ft. diam. and 8 ft. high; it condenses most of the sulphur that may be volatilized accidentally.

From the top of this receiver a 3-in. wrought-iron pipe is carried up to the top of the plant, and then along the entire length of the lead section. Into this pipe the 1-in. pipe leading to each agitator is connected. The smaller pipes, one inch and half-inch, are fitted together with unions so that they can be readily taken apart and cleaned in case they become blocked. The sulphur burnt amounts to 1 to 1.3 lb. per ton of slime treated.

The supply of acid for the plant is run from the acid plant to the main tank through a 1-in. lead pipe; this tank is placed at the highest point of the plant, and the acid can be drawn from it to the three smaller tanks placed close alongside the small mixers at the head of each section. All these tanks are fitted with overflows leading to a large tank on the ground-level. By opening a valve in the bottom of any of the elevated tanks the acid can be run to this tank; the arrangement is convenient, and repairs can be readily effected at any time.

The principal points that require careful watching are as follows:

(1) That the temperature of the pulp at the head of the lead section does not rise above 90° F. If it does, the line has a tendency to float and seems to crowd out the lead.

(2) That the pulp on the lead section does not rise above 27% solid by weight. Higher pulps result in low-grade lead concentrate and incomplete recovery; this, of course, means low-grade zinc.

(3) That too much hyposulphite is not used. If more than 3 lb. per ton is added, it causes the zinc to be slow in floating in the zinc section and makes a high tailing.

(4) That the acidity of the pulp on the lead section

does not rise much above 0.03%, as this has the same effect as too much temperature. If the solution becomes neutral, the lead concentrate falls in grade owing to gangue passing over with it. In practice no trouble is experienced in maintaining any of these conditions.

(5) That the SO_2 pipes do not become choked. The SO_2 keeps the lead clean, and a choked pipe generally shows itself in the color of the lead flowing from the separation-box. Choked pipes also increase the power required to drive the agitators. The chief cause of this trouble is volatilized sulphur, due to excessive heat in the burners. This can be checked by having a few holes in the 3-in. SO_2 main, which, if the temperature of the burner starts to rise unduly, can be opened; air will then be drawn in through these and less through the burner, thereby checking the combustion.

The assay of the material being treated is as follows:

Zinc	16.5%
Lead	12.8%
Silver	15.5 oz.
Oxidized lead	4.7%

Sizing-tests on the feed give:

Plus 150	8.0%
Plus 200	5.5%
Minus 200	86.5%

The lead concentrate contains:

Zinc	8.0%
Lead	63.0%
Silver	84.0 oz.

The zinc concentrate contains:

Zinc	50.0%
Lead	4.0%
Silver	13.0 oz.

The tailing contains:

Zinc	2.0%
Lead (total)	8.0%
Silver	4.2 oz.
Oxidized lead	7.0%

The agitators in this plant run for five weeks, when they require new lining-plates and new runners. Between 14,000 and 15,000 tons of slime passes through the agitators in this time. From three to four agitators are changed weekly. The elevators have to be overhauled every week, and the slide-valves over the discharge-pipes of the separation-pans have to be seen to weekly. The slides are made so that they can be turned upside-down, and when one end is worn it is turned top-to-bottom and then runs for another period. These constitute the main repairs.

Small-scale tests indicate that the oxidized lead now passing out with the tailing can be readily re-sulphidized and recovered together with the silver, reducing the assay of the residue to about 1% lead and 1 oz. silver per ton. A plant is now being designed to do this.

Gold For Industrial Use

Following the order on September 6 permitting a resumption of restricted deliveries of gold from the Mints for manufacturers use, a further notice was issued on September 9, and we reproduce the announcement as made by Verne M. Bovie, superintendent of the U. S. Assay Office at New York:

"The trade is hereby notified that I have this morning received the following order from the Director of the Mint:

" 'Pursuant to an Act entitled 'An Act to authorize the receipt of U. S. gold coin in exchange for gold bars', approved May 26, 1882, as amended by an Act approved March 3, 1891, and by an Act approved March 3, 1901, it is hereby ordered that from and after this date, and until further notice, the several Superintendents of coinage Mints and of the U. S. Assay Office at New York shall not pay nor deliver gold bars in exchange for U. S. gold coin or gold certificates pursuant to said Act, unless the applicant therefor shall obtain and exhibit to the Superintendents concerned the following documents of authority:

" '1. In case of bars intended for industrial use within the United States (including the Canal Zone and all Territories and waters, continental or insular, subject to the jurisdiction of the United States), an industry priority certificate issued by the War Industries Board, or a similar authority from said Board, for the use intended to be made of such bars.

" '2. In case of bars intended for exportation, license for exportation issued by the Federal Reserve Board.

" '3. In any other case a special order of the Secretary of the Treasury approving the transaction.

" 'When any gold bars are delivered to any applicant pursuant to the foregoing, the date of delivery, the value of the bars, and such other data as may be necessary to indentify the transaction shall be entered, or endorsed, by the Superintendents concerned, upon the document of authority in such manner as may essentially prevent the use of such document in the future as authority for a repetition of the delivery of gold bars of the value then delivered. The Director of the Mint is authorized to issue such further instructions as may be necessary to carry into effect the foregoing order.'

"In accordance with said order, no further payments of gold bars in exchange for gold coin or gold certificates will be made except in the manner indicated in said order."

The Director of the Mint has virtually suspended deliveries of gold bars for industrial purposes until further regulations controlling industrial uses of gold shall be framed. The gold drawn from the Treasury for alleged application in the arts during the fiscal year ended June 30 this year, amounted to $55,000,000, which was $12,000,000 in excess of withdrawals for like purposes in the preceding year. For comparison it is interesting to note that the annual report of the Director of the Mint for 1917 records that new gold was issued to manufacturers in 1916 to the value of $41,120,149, in 1915, $29,599,507, in 1914, $37,412,758, in 1913, $37,501,831, in 1912, $35,870,552, and in 1911, $33,103,054. These figures do not include the old gold, in the form of jewelry, plate, and scrap, in the returns from private refineries. This has been running at the rate of from seven to nine millions of dollars' worth per annum. The sudden increase in the demand for new gold was regarded as not being wholly warranted by legitimate need in the arts.

THE ILMEN MOUNTAINS, IN THE URAL REGION

The Physical Geography of the Ural Mountains

By H. W. TURNER

The present and prospective operations of the Allies, seeking to aid the Russian people to establish a stable government, lend especial interest at this time to the geography of Russia.

The Russian dominions are peculiarly unfortunate in their relation to foreign commerce in that the numerous gulfs and bays of the coast are all ice-bound in winter except at Kola on the Arctic and in the Black Sea. However, numerous large rivers aid internal communication. Of these the Don and the Dniester drain into the Black Sea and thus afford a means of cheap transportation from Little Russia to warm-water ports connected with the ocean; but the most important river of old Russia, the Volga, ends its long career in a dead sea, the Caspian. Petrograd is situated at the eastern tip of the gulf of Finland, which is frozen in winter. So is the entrance to Vladivostok, on the Pacific. The Dvina, Ob, Yenesei, and Lena, all large rivers that drain north into the Arctic, and the Amur, draining easterly into the Pacific, at Nikolaievsk, are ice-bound in winter. It is small wonder then that the Russian government for centuries has looked with longing eyes at Constantinople, and later at Port Arthur.

On the sketch map (Fig. 1) is shown the general position of the Ural range, which forms the dividing line between old Russia on the west and Siberia on the east. The Allies are already established at two points, namely,

(1) Murmansk on the Arctic Ocean, where there is an open port in winter, which has recently been connected with Petrograd by a railroad, and

(2) Archangel, the seat of the new Tschaikovsky government and the present home of the American embassy. Archangel is on the White Sea and is not an open port in winter but is connected at Vologda with the main Perm-Petrograd railway.

The Ural mountains are doubtless regarded by many as a high and definite range separating Russia from Siberia. As a matter of fact they consist rather of a series of nearly parallel ridges rarely exceeding 5000 ft. above sea-level. These ridges form a broken chain extending geologically from the island of Nova Zembla in the Arctic to near the Aral sea, a distance of over 1800 miles. At the south end the range may be said to fork, the direct southern continuation to the Aral sea being known as the Mugadzhar mountains, whereas another branch extends westward along the north side of the Ural river, west of Orenburg.

While now a broken chain, the geological evidence indicates that at one time the Ural mountains were much higher and were formed of a series of nearly continuous ridges. The rocks comprising the chain are chiefly of the Devonian and Permo-Carboniferous ages. Along the central axis the Devonian rocks have been sheared and compressed into schist, with which are associated large

areas of intrusive igenous rocks, serpentine (peridotite), gabbro, diorite, and granitic rocks. There are also areas of greenstone representing former surficial volcanic extrusions now metamorphosed. The serpentine is known to be the source of much of the platinum for which the range is famous. In the Devonian schist and associated metamorphic and intrusive rocks are likewise found many important copper and iron deposits, while the Permo-Carboniferous series on the flanks of the range likewise contain numerous small deposits of hematite ores that have been mined and smelted since the time of Peter the Great. In traversing the central Ural region by wagon-roads, the traveler is surprised at the great number of these little smelting-works, each with a reservoir of water, near which is always a town or village, the home of the iron-workers and miners. Except in the larger towns, the prominent structure in these places is usually the Greek church.

The iron mines themselves are often mere surface cuts, although sometimes of large dimensions, and if future military operations reach to this region these old cuts may easily serve as ready-made trenches. Some of them, as in the north-western portion of the Kasli district of the Kyshtim estate, extend in broken lines for miles.

The copper deposits are less developed, but some of them have been mined and smelted for over a hundred years. One of the more important copper properties is that at Kyshtim, belonging to a British company, but now taken over by the Bolshevists and operated by them. This was a comparatively easy matter, since most of the foreign technical staff had been replaced by Russians educated at Freiberg, Germany, before the control of Russia passed to the Bolshevists. Some of the smaller copper deposits on the estate and many of the iron deposits were worked by the Russians in the previous century, but the treatment of the pyritic copper ores awaited the application of modern smelting methods introduced by the present British owners. Since the taking over of the property by British capital, more than 44,000 tons of copper metal has been produced, most of which was refined on the estate in the first copper-refinery established in the Ural.

The present writer is familiar only with the central Ural region (Fig. 1), and the following descriptions apply more particularly to this area. The main Moscow-Vladivostok or Trans-Siberian railway crosses the Ural range at Miass and Zlatoust; from Cheliabinsk, a little to the east, a branch line runs north along the axis of the Ural through Kyshtim to Ekaterinburg. This is the most considerable town in the Ural region and was reported to have 70,000 inhabitants before the War. It was near this place that the former Czar is said to have been executed. From Ekaterinburg one branch of the railway runs westward through Perm, Viatka, and Vologda to Petrograd; another branch goes south-easterly through Tumen to Omsk, where it joins the Trans-Siberian main line.

The prosperity of the Ural region is based largely on the mining and gem industries. The great central market for gems is Ekaterinburg, the gems being mostly of the

FIG. 3. BASHKIRS IN CAMP

semi-precious kind, such as aquamarine, topaz, zircon, corundum (sometimes fine enough for sapphires), phenacite, alexandrite, and amethyst, all of which come from from the surrounding mountains. Ekaterinburg is also the home of the Société Ouralienne des Amis des Sciences Naturelles. This society has creditable collections and publishes the results of scientific investigations made by its members. Near its museum is the Imperial establishment for polishing the many ornamental stones of the Ural, used for interior decoration of chapels and art buildings.

The Ilmen mountains, one of the separate ridges of the Ural range near Miass, is particularly noted for large crystals of aquamarine, topaz, zircon, amethyst, and amazon-stones, the last a green variety of orthoclase feldspar. These crystals occur mostly in pegmatitic veins in gneissic rocks.

The general topography of the hilly portions of the Ural is more or less similar throughout (as illustrated by Fig. 2), which is a view in the vicinity of Soymonovsk in the southern part of the Kyshtim estate. The hills in the distance have an elevation of about 2500 ft. Between the ridges there are meadows, often wet and traveled with difficulty by wagons during the summer season, except where roads have been built.

Along the axis of the Urals and more particularly on the flat eastern slope, which merges into the great Siberian plains, there are numerous lakes, some on rather flat land, as Lake Uvildi on the Kyshtim estate, and others surrounded by hills. Most of these are well supplied with edible fish.

Taken as a whole the Urals are well wooded, in the central portion chiefly with small pines, trees over two feet in diameter at the base being unusual. Nevertheless these trees are suitable for the saw-mill and are almost universally used by the peasants in constructing their cabins. They are also used for larger structures in many places.

The climate is not dissimilar from that of northern Alberta, the winters lasting from October to May, being quite cold, with a minimum temperature of about 40° F. below zero and uncomfortably warm sultry spells in the summer with temperature in the 'eighties. The precipitation is moderate, the snow being seldom over three feet deep in the winter, while showers are frequent in summer.

The chief inhabitants of the Ural are typical Russians, but on the flanks and neighboring plains are many Bashkirs (Fig. 3). These people belong to an ancient Tartar-Finnish race and number several hundred thousand. Originally independent, they submitted to Russian rule in 1556. They lead a nomadic life, are largely employed in raising stock, and are Mohammedan in religion. Like the Kirghiz of Siberia, they are not subject to military duty, except as volunteers.

MANGANESE imports into the United States for the first half of 1918 totaled 244,823 tons, a decrease of 61,967 tons when compared with 1917. Brazil supplies most of this. Final figures of shipments from that country during the last three years are as follows: 1917, 532,855; 1916, 503,130; and 1915, 288,671 metric tons. In the last two years all went to the United States. The Brazilian output in 1913 was only 120,000 tons.

The Fluorspar Industry

Statistics of the fluorspar industry in 1917, prepared under the direction of Ernest F. Burchard, of the U. S. Geological Survey, show a great increase in the domestic output of this valuable fluxing mineral, when compared with former years. Shipments of spar from the mines in 1917 were 218,828 short tons, valued at $2,287,722, an average price of $10.45 per ton, compared with 155,735 tons, valued at $922,654, or $5.92 per ton, in 1916. This represents an increase in tonnage of 40.5% and in value of nearly 148%. The quantity of crude fluorspar mined in the United States in 1917 reached a total of 280,825 tons, compared with 175,165 tons in 1916, an increase of more than 60%. Stocks of marketable spar on hand at the end of 1917 amounted to 21,655 tons, compared with 3666 tons at the end of 1916, but a considerable part of this stock was under contract, awaiting cars, boats, or weather favorable for shipment.

The demand for fluorspar may be said to be governed mainly by the open-hearth steel industry, so that supplies that are within reach of steel-making centres are certain to be drawn-on heavily during war times. Mines in all producing States except Arizona reported an exceptionally heavy demand during 1917, and the high prices stimulated prospecting and led to the opening of many hitherto unworked deposits in Illinois, Kentucky, and Colorado.

The apparently moderate average price received for fluorspar at the mines during 1917 was largely due to the making of sales on yearly contracts, but spar not so purchased was subject to much higher prices. In January and February 1917 gravel-spar for prompt shipment brought $21.50 per ton at the mines, and a year later $38 to $40 was reported as the ruling price. The latter figures were unduly inflated because cold weather and railroad congestion retarded both mining and transportation. Prices decreased from these high levels later in 1918, so that in June and July, $28 to $30 at the mines was quoted for gravel spar carrying 85% calcium fluoride (CaF_2).

Gravel-spar constitutes the bulk of the shipment. In 1917 the output of this product amounted to 183,144 tons, valued at an average of $9.61 per ton, compared with 133,651 tons, valued at $5.34 per ton, in 1916. Lump-spar and ground-spar also increased.

Imports of fluorspar in 1917 increased slightly in quantity but greatly in value, 13,616 tons, valued at $8.42 per ton, having been imported in 1917, compared with 12,323 tons, valued at $4.38 per ton, in 1916.

Estimates of production for 1918 total 218,000 tons. If sufficient labor, machinery, and other supplies were available the output would be larger.

Simple Method for Determining Sulphur Di-Oxide

By G. W. JONES, J. H. CAPPS, and S. H. KATZ

INTRODUCTION. *The engineers of the U. S. Bureau of Mines have had need for a method for determining the amount of sulphur di-oxide in the air of sulphide-mineral mines, especially in the event of fires. The requirements were an apparatus of strong, cheap, and readily replaceable parts, easily portable, and workable by the average engineer. With these ideas in mind the method herein described was developed. No especial originality is claimed for it. Similar processes have been used by others for a long time. It is believed, however, that this adaptation can be used to advantage in the particular field for which is was planned. During the experiments a record was made of observations of the effect on the senses produced by various concentrations of sulphur di-oxide gas.

The work described herein forms part of an uncompleted study of sulphur di-oxide to be published by the Bureau of Mines.

APPARATUS. The main apparatus, shown in Fig. 1, consisted of two 2½-litre aspirating-bottles with tubulars joined by a rubber tube, clamped with a pinch-cock. One bottle was completely filled with acidified water to be described later. This bottle was closed with a two-holed rubber stopper. Through one hole was run a 100-cc. separatory funnel with a stem of 1-mm. bore. The top of the funnel was closed by a one-holed rubber-stopper glass capillary-tube, rubber tube, and pinch-cock. Through the other hole of the rubber stopper extended one arm of a three-way cock. This arm was bent into U form, for the purpose of directing the incoming stream of gas against the rubber stopper so as to break it up and prevent contact of gas and water as much as possible. The other bottle was closed with a one-hole rubber stopper holding a guard-tube. This was filled with soda-lime with one inch of cotton wool on top for a filter. The guard-tube was closed by a one-hole rubber-stopper glass tube and rubber tube with pinch-cock.

This apparatus, together with its accessories, was carried, in the receptacle shown in Fig. 2, designed for portability and accessibility. The accessories consisted of five bottles of reagents, to be described hereafter, a 50-cc. graduated cylinder with divisions 0.2 cc. apart, two long glass tubes, and a rubber-bulb hand-pump with rubber tubing attached. The tubes and pump were for use in securing samples. An extra guard-tube containing soda-lime was provided for use in some special instances. The outfit and case complete measured 10½ by 20½ by 23 in. and weighed 35 pounds.

SOLUTIONS. The liquid used to aspirate the sample into the bottle is the purest drinking-water, readily available at the place where analyses are to be made. Since such waters vary in alkalinity and in other properties that might affect the results, 10 cc. of the sulphuric acid is added to the 2600 cc. of water needed.

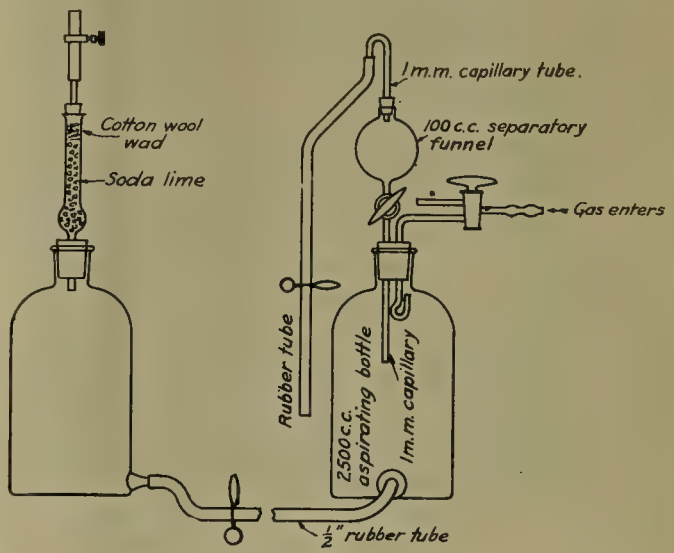

FIG. 1. SULPHUR DI-OXIDE APPARATUS

The 10 cc. of starch-solution is added to serve as indicator; 250 cc. of starch-solution was provided. This was made by mixing 50 grammes of starch to a paste with cold distilled water, diluting to 500 cc. with distilled water, boiling a few minutes, stirring meanwhile, then diluting to one litre with 500 cc. of distilled water containing 2 gm. of potassium iodide, and adding a few drops of chloroform as preservative. 250 cc. of thio-sulphate solution was provided. The strength was roughly 1/40 normal.

A bottle containing 250 cc. of chemically pure sulphuric acid, of 1.84 sp. gr., was provided; also one litre of distilled water.

One litre of iodine-solution was provided. This was approximately 5/100 normal, accurately standardized with arsenic tri-oxide. One cubic centimetre was roughly equivalent to 0.02% SO_2 when used in the apparatus.

PRELIMINARY OPERATIONS. Before taking a sample a few cubic centimetres of the iodine-solution are poured into the separatory funnel and shaken to wet the walls.

*Published by permission of the Director of the U. S. Bureau of Mines.

All the water in the aspirating-bottles is then titrated to the first distinct blue color. Trial during the preliminary work with this method showed that one to two drops of the solution sufficed to change the liquid from colorless to blue when the point of change had been reached. The point where the change occurs should be closely observed, and this amount for the actual color-change should not be exceeded. In case the end-point is over-run a few drops of the thio-sulphate solution may be added till colorless and the titration with iodine repeated till the exact end-point is found.

When the aspirating solution is titrated to the point of color-change the excess iodine is wasted onto the ground by allowing it to drain from the separatory funnel through the capillary tube for half a minute.

Taking the Samples. Two conditions may confront the operator in securing his samples. In the one case the operator is standing in the atmosphere that is to be analyzed. Here the method of sampling is obvious. In the other case the sample is to be taken from behind a wall or brattice.

In case the sample must be taken from behind a brattice, an opening is first to be provided. The rubber tube attached to the intake-end of the hand-pump is attached to a glass tube and the glass tube pushed through the opening. The end of the tube should extend at least a foot beyond the inside wall. The excess opening in the brattice should then be stopped with moist earth or a handkerchief. The rubber tube on the discharge end of the hand-pump is slipped over the tube and the cock turned so as to pump into the outside air. The pump should be worked about three minutes till the gas from behind the brattice fills all the tubes. Then the cock is turned so as to connect with the interior of the bottle.

The sample-bottle is held about three feet above the other to allow rapid transference of the water. On trial about 45 seconds was required for this. The bottom of the bottle should be held level and as much water allowed to flow out in this position as will. Calibration showed 2500 cc. + 10 cc. to the volume of gas sucked into the bottle under these conditions.

Determination of Sulphur Di-oxide. When the sample is secured 50 cc. of iodine solution, measured in the graduated cylinder, is poured into the separatory funnel and the rubber stopper replaced in the funnel. When handling the iodine solution in an atmosphere containing sulphur di-oxide it must be borne in mind that the atmosphere acts upon the reagent. Hence it should be protected as much as possible and handled rapidly when exposed. The free end of the small rubber tube connecting with the separatory funnel is taken between the teeth of the operator, the pinch-cock let down till the tube runs through the circle, pressure is blown upon the iodine solution as desired, and the tube pinched tight with the teeth. The titration is now made, during which the pressure on the iodine solution is increased or decreased as needed. During the titration the bottle is shaken vigorously so as to rinse all parts of the walls with the solution in the bottom. When the end-point is established half the displacing liquid is allowed to run back into the titrating-bottle. When the surrounding atmosphere contains sulphur di-oxide, this should be done rather slowly, the bottles being on the same level and the guard-tube securely in place, and its clamp opened. The water in the titrating-bottle is then again titrated to the end-point, after which the rubber stopper holding the separatory funnel is transferred to the other bottle and the other half of the water solution titrated to the exact end-point. This completes the titration. The residual iodine solution is run into the graduate, allowed to drain half a minute and the volume read. The difference between this and the original volume is the volume used in titrating.

In case the determination must be made in an atmosphere where breathing apparatus is necessary the pressure on the iodine solution in the separatory funnel may be made by means of the hand-pump and retained by means of the pinch-cock. In this case the extra guard-tube of soda-lime should be inserted between the funnel and the pump.

When less than 5 cc. of iodine solution is needed to make a titration it has been found best to repeat the experiment with a more dilute iodine solution. The funnel is rinsed with distilled water and drained; 5 cc. of iodine solution is measured into the graduate and distilled waste added to the 50 cc. mark. The solution is thoroughly mixed, poured into the separatory funnel, and the experiment repeated. Trial showed that a distinct end-point could be established in a dark room by the light of a flash-light with five drops or less of this dilute solution.

Calculation. The iodine solution should be standardized to read cubic centimetres of sulphur di-oxide at 760 mm. and 0° C. Changes in barometric pressure and temperature would affect the determinations, and for that reason must be taken into account in making the calculations. Standard conditions of 760 mm. barometric pressure and 0° C. temperature should be the basis for comparison of all analyses. Fig. 3 is a graph of factors to be used to reduce observed percentages to those at the standard conditions. An example will show how these are to be used: 11 cc. of iodine solution was used to titrate the SO_2 in a sample, the barometer stood at 720 mm. and the temperature was 15° C.; 1 cc. of the iodine solution was equivalent to 0.4327 cc. of sulphur di-oxide gas at standard conditions. What was the percentage of sulphur di-oxide in the gas when reduced to standard conditions?

$0.4327 \times 11 = 4.76$ cc. SO_2 at standard conditions.

$\frac{4.76}{(2500 = \text{vol. in analyzing-bottle})} \times 100 = 0.1904$ apparent percentages of SO_2.

1.055 is factor for 720 mm. from graph,

1.055 is factor for 15° C. from graph,

$0.1904 \times 1.055 \times 1.055 = 0.21\%$ SO_2 at standard conditions.

In doing the work, recording data, and making calculations it is best to carry through three significant figures. Then cut those beyond the nearest second significant figure when the calculation is completed. When the pro-

portion of sulphur di-oxide is below 1%, no accuracy beyond the two figures can be claimed for the method.

It is obvious that the calculation can be shortened when one set of apparatus and solutions is used continuously for analyses, by means of factors common to all calculations.

Tests of the method throughout its entire range were made by analyzing synthetic mixtures of air and sulphur di-oxide of known composition. The errors of measurement in forming the synthetic mixtures were as large or larger than those from the iodine determination. The results indicate not the absolute accuracy of the method but rather the fact that it may be depended upon to indicate sulphur di-oxide in air from a minimum of a few parts per million to 1% or more.

The method is fully as accurate as the most precise gastrometric methods within the range of laboratory apparatus; furthermore, it has a range extending down to a lower limit of about ten parts per million parts of gas. Though the range extends from this low figure of sulphur di-oxide to many thousand parts per million, it may be considered accurate only to two significant figures except in the higher ranges.

EFFECTS ON THE SENSES. During the experiments in the room containing sulphur di-oxide it was necessary to wear breathing-apparatus of the type used for mine-rescue purposes, in all but the lower concentrations. The apparatus had a mouth-piece for breathing and soft rubber-edged goggles, which readily conform to and fit the face, for protecting the eyes. The rubber parts of the goggles were wet and carefully adjusted to secure accurate fitting. The utmost care was necessary to have perfect adjustment especially in the higher concentrations of sulphur di-oxide. If such care was not taken the gas penetrated to the eyes, producing pain and blindness.

The observations made during the tests are arranged in order of increasing concentration of sulphur di-oxide in the following table:

Effects of sulphur di-oxide in various concentrations on the senses

Concentration by iodine method, %	Test No.	Observations
0.0037	26	No mask worn. Slight smarting in nose. Slight depression in breathing.
0.0037	25	No mask worn. Smarts in nose, slightly depressing to breathe.
0.0056	24	No mask worn. Smarting of nose, slightly difficult to breathe.
0.0074	23	No mask worn. Smarting of nose, shortness of breath, no discomfort to eyes.
0.011	22	No mask worn. Smarting of nose, shortness of breath, produced discomfort of eyes and flow of tears.
0.013	21	No mask worn. Smarting of eyes and nose. Makes shortness of breath. Could remain in room only with difficulty.
0.013	32	Taken without mask, but difficult. Had to close eyes most of time. Affected throat and lungs.
0.017	20	No mask worn. Smarts in nose and makes the eyes water. Could not remain in room.
0.024	19	Without mask could stay in room only short time. Produced choking and shortness of breath.
0.034	18	Without the mask the gas badly affected the eyes, nose, and lungs. Mask was worn to secure sample.
0.037	31	Without mask the gas bites passages in head and throat, breathing is very difficult, eyes smart a bit. Could endure it half a minute.
0.037	1	Smarted in eyes, etc. Mask was necessary to secure samples for analysis.
0.041	17	Mask was necessary.
0.052	16	Impossible to enter room without mask.
0.093	15	Impossible to enter room without mask.
0.10	29	.....
0.13	14	.....
0.13	11	Hurts small cut on finger.

FIG. 2. RECEPTACLE FOR PORTABLE SULPHUR DI-OXIDE APPARATUS

Concentration by iodine method, %	Test No.	Observations
0.15	28	
0.17	13	
0.19	10	Gas penetrated rubber goggles, smarted in eyes.
0.21	9	
0.25	12	
0.25	4	Gas penetrated goggles, blinding on eyes, had difficulty in securing samples.
0.26	3	With mask well adjusted, work could be done without difficulty.
0.30	8	
0.33	27	
0.36	2	
0.37	7	
0.50	6	Mask required good adjustment to keep out fumes.
0.87	5	

By referring to this table an estimate of the proportion of sulphur di-oxide in air may be made by an observer without analysis, and estimates even may be made for concentrations lower than those investigated. The lowest concentration of gas tested by analysis was about 40 parts per million. At this concentration the air had a biting effect on the mucus membrane of the nose. Undoubtedly at one-tenth of this concentration, or four parts per million, sulphur di-oxide would have a distinct odor.

Although experiments were not made with other gases that may be determined by means of iodimetry, the apparatus may be used to determine such gases as hydrogen sulphide, chlorine, oxides of nitrogen, and some others. In the case of chlorine and nitrogen oxides, iodine would be liberated in the water solution, which should contain some potassium iodide. The starch-iodine blue solution would then be titrated to colorless by means of a standard sodium thio-sulphate solution.

SUMMARY. A method and apparatus for determination of sulphur di-oxide by means of the iodine titration has been developed for the use of engineers working in the field. The apparatus is strong, cheap, easily replaceable, and assembled into a case designed for portability. The method is not accurate beyond two significant figures, but has a range from about ten parts per million by volume to 1% or more. Also, with the aid of the table giving the effect upon the senses of varying concentrations of SO_2, it is possible to estimate the small proportions of sulphur di-oxide without analysis.

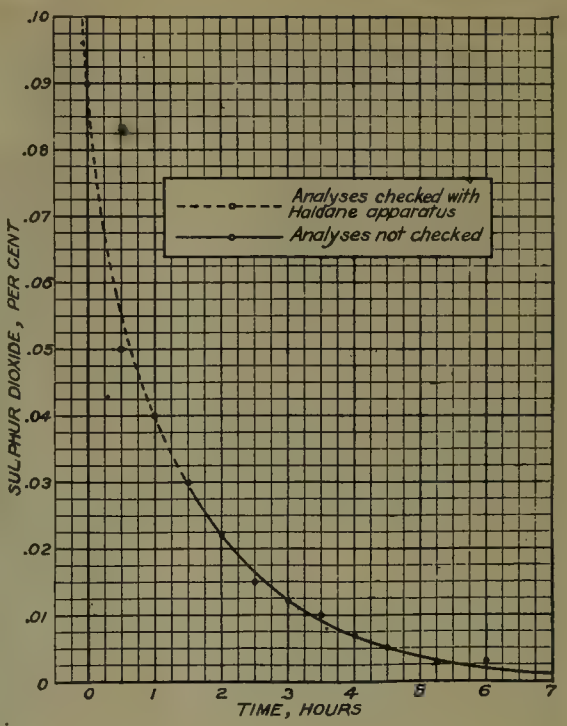

FIG. 4

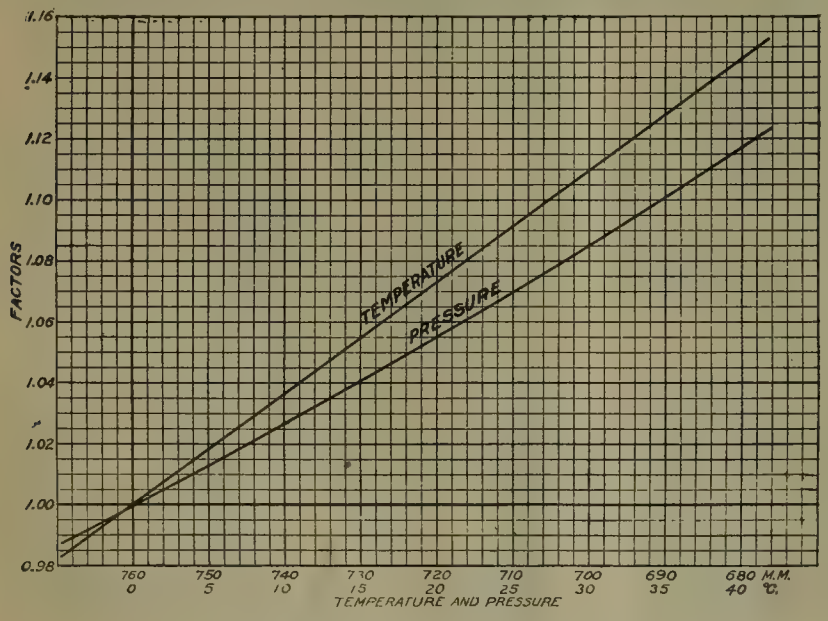

FIG. 3. GRAPH OF FACTORS USED IN SULPHUR DI-OXIDE CALCULATIONS

THE RELATION OF SULPHUR in the poling of copper, as brought out by the Stanislaus Skowronski, in Bull. A. I. M. E., is that of a direct agent in over-poling, the Cu_2O left in the copper acting only as a neutralizing agent for the sulphur. The sulphur automatically controls the amount of oxygen present in the refined copper. It is impossible to over-pole copper by over-reduction if the copper does not contain sulphur. The author concludes that, since no reliable data are at hand as to the actual effect of hydrogen and CO on over-poling, the above fact should be taken to indicate that in addition to the effect of sulphur there is probably an additional effect from H, or CO, or both.

Notes on the Cyanidation of Silver Ore at El Oro, Mexico

By F. A. MALINS

One day recently when passing the shaft of the Carmen de Virgenes mine (near the Dos Estrellas) in Michoacán, Mexico, I noticed a pile of ore that had a distinct canary-yellow color.

On investigation it appeared that the yellow color was due to sulphur. Much of the ore inside the pile showed argentite (silver sulphide), and this mineral, having been wetted by rain, had slowly decomposed; this, in conjunction with the air contained between the particles of mineral, had caused the decomposition of the argentite, with the formation of sulphuric acid and the precipitation of metallic silver, according to the following equation:

$$2Ag_2S + 3H_2O + 7O = 2H_2SO_4 + 4Ag + H_2O + O$$

The numerous crystals of argentite throughout the mass were all somewhat decomposed, some being lightly coated with a black sooty material, which appeared to be black amorphous metallic silver. Apparently the dilute sulphuric acid was, as might have been expected, slowly attacking this silver (the solution being cold), but, in the presence of other minerals in the gangue, it was also to some extent being itself decomposed, with separation of sulphur. If such acid were diluted sufficiently by the rain-water a large loss of silver might be caused by the solution of the silver sulphate.

It would appear therefore to be a good idea in a rainy country to keep ore carrying argentite under cover.

From the above chemical reactions another inference may be made:

If such argentite had been subjected while in the vein to a circulation or (slow but constant) passage of water carrying sufficient air through it, a portion of such silver sulphide would have been dissolved as silver sulphate and carried away with such water to its outlet, and so have been lost; or else while in solution, meeting other waters carrying the necessary salts, such as sodium chloride, it would have been precipitated as silver chloride at such point of meeting. But, evidently, the enclosing quartz was too impermeable to have permitted this, and the argentite has remained unchanged.

It appears certain that the silver in the oxidized ore of our Dos Estrellas mine is not (as believed by many) in the form of a silver sulphide, but rather in the amorphous metallic form partly annealed, and in the condition usually prevailing in most oxidized ores.

The silver after decomposition of the silver sulphide in the tube-mills would be in the black amorphous form. The silver in the oxidized ores, which show no free gold or silver, is in the amorphous form also, but, in addition, it is partly annealed, though not sufficiently to have a metallic lustre or to be visible to the naked eye.

The silver sulphide when present in the Dos Estrellas ore is so finely disseminated, and so much pyrrhotite and also ferroso-ferric sulphates (caused by decomposition of pyrrhotite) are present, that it is hard to detect the presence of such silver sulphide. It is, however, found occasionally in crystals of sufficient size to permit of identification.

The principal reasons for believing that these ores are generally oxidized are:

(*a*) If the silver were in the form of silver sulphide (in a small or reasonable amount) it would (as actually occurs with ores carrying argentite in the Dos Estrellas and in other parts of the district) be at once decomposed in the tube-mills owing to the intense agitation and aeration, aided by the considerable amount of heat produced, and also by the 'greta' (crude litharge) and lime fed to the mills, as well as by any zinc in solution, and this would cause all or the greater part of such silver (which, it should be remembered, would be in such case the black amorphous form freshly precipitated and consequently in the most soluble condition) to be dissolved by the free cyanide in such tube-mills. But this does not happen to a noteworthy extent. Not over 50% of the silver goes into solution in the tube-mills.

(*b*) The hydrocyanic acid in the cyanide, not being as strong an acid as the sulphuric, the solution of the amorphous partly annealed silver would be a question of time (as well as of fine grinding). And time has certainly proved to be necessary for good extraction.

Other reasons why long time is necessary are that not only is the hydrocyanic acid of the cyanide a weak acid as compared with other acids, but the solution of cyanide ordinarily used in the mill is very weak anyhow. In the Dos Estrellas mill we use a strength of only 0.06% KCN. Also the larger part of such silver is probably not in the true amorphous form, but has (as stated more fully later) been more or less annealed while lying for ages in the vein, thus making its solution by cyanide a matter of much greater difficulty, and one requiring a considerable amount of time.

This applies to the gold, but in less degree. The particles of gold are apparently finer than those of the silver, and go into solution more readily in the tube-mills. I am speaking here of partly annealed gold. The mill-ore at Dos Estrellas carries no free gold (annealed gold) visible to the naked eye.

But in addition to the silver sulphides and the free (though very fine and partly annealed) gold in the ore we have to deal with the gold and silver set free in the tube-mills, by joint chemical and mechanical action, from pyrrhotite, and also with the gold alloyed with silver, of which there is much in all the oxidized ore, forming the larger part of the metal to be extracted.

Now the pyrrhotite (which is the principal valuable sulphide mineral at Dos Estrellas) carries both, but in varying proportions. Such pyrrhotite as is decomposed by joint chemical and mechanical action in the tube-mills (in the same manner as silver sulphide is decomposed) gives up its gold and silver in the black amorphous form, to be dissolved promptly in the tube-mills. That part of the pyrrhotite which escapes decomposition in the tube-mills issues from them in a finely-divided state, and may perhaps give up a portion of its value during its four days' treatment by direct percolation of its particles by the cyanide.

At Cripple Creek, Colorado, some years ago (in 1894) I obtained some pieces of coarsely-crushed pyrite from a Battle Mountain ore that carried pyrite, but in it also were found pseudomorphs of gold in the cubic form, filling cavities originally occupied by pyrite. The ore carrying this pyrite had been treated with strong cyanide solution for 24 days in percolation vats at the Brodie mill.

On examining these crystals under a strong glass the polished sides seemed to show slight markings, which under the microscope proved to be an infinitesimal number of minute holes, blackish in color, apparently caused by the cyanide following in and dissolving out the gold. There were more of these markings in some places than others. These facts seemed to show that:

1. If time enough is given, cyanide will extract gold from pyrite (and probably also from pyrrhotite, as it is softer and usually richer) by direct percolation of each crystal.

2. The gold is not chemically united with the pyrite (or probably pyrrhotite also) as a sulphide of iron and gold, as has been believed by many people, but is contained in it as a mixture, the particles of gold lying side by side with the particles of pyrite.

(3) Such gold was not mixed evenly in the crystals, but there was more in some parts than in others.

There still remains the gold and silver alloy contained in the oxidized ores; the precious metals arrive in a more or less annealed form, as well as alloyed together, this annealing having occurred while in the vein. They are not soluble in cyanide as readily as the black amorphous metals freshly obtained from chemical deposition while in the tube-mills. The reverse obtains in the amalgamating-pan. Here the fact that the gold (or the gold and silver alloyed) is partly annealed, plus the further annealing caused in the pan owing to rubbing action, causes the metals to be easily assimilated by mercury.

These alloyed metals, as might be expected, are the most difficult to dissolve, because of their more annealed and consequently more solid and more compact form. If time enough could be given, it is probable that all or almost all could be dissolved, provided the crushing were fine enough; but this is impossible in practice.

It might be supposed that the continuous beating of such particles of metal against the sides of the tube-mill would anneal them and put them into leaf form, so that they would be soluble in cyanide in the presence of the air that is beaten into the solution, aided by the heat generated. But this does not happen notably, because, as mentioned before, not more than 50% of the total silver goes into solution in the tube-mills.

In my laboratory tests, made with a view to studying the form in which precious metals exist in the tailing, I have so far never been able to detect any precious metals in the tailing from the mill-ore of this mine except just pure gold and silver alloyed, with occasional particles of low-grade pyrrhotite. That they do exist in the tailing as an alloy is indicated too by the fact that whether the tailing be high or low it carries about the same proportion of gold to silver; and the fact that this gold is apparently refractory, and goes into solution at only the same rate as the silver, is due to the fact that they are intimately alloyed, and for that reason the gold cannot dissolve any faster than the silver; and silver is generally considered to require more time for its solution than gold.

It might be possible to reduce the loss in such tailing by strengthening the cyanide solution, or by giving a longer time for agitation, or both. Experiments show that by crushing all to pass a 200-mesh sieve a much larger recovery can be made, especially of the gold; but it is not economical to do so.

GOLD PRODUCTION of Western Australia, and labor employed, is as follows:

Year	Gold output	Men employed
1903	£8,335,579	17,329
1914	5,157,760	11,722
1915	5,078,155	10,598
1916	4,382,497	9,563
1917	4,066,860	8,529

The year 1903 was the period of greatest production, the decline setting in thereafter. The cost of producing gold at the Great Boulder mine in June was $9.75 per ounce, on 10,300 oz. extracted; at the Horse Shoe, $17.25; at the Sons of Gwalia, $18; Bullfinch, $19.25; and Ivanhoe, $16.50 per ounce.

ANTIMONY SULPHIDE is used largely as a constituent in military and sporting arms primers. It has been shown by A. S. Cushman that (1) the purity of liquated 'needle antimony' should be determined from its sulphur content, (2) purifying 'needle antimony' by tartaric acid is unjustifiable if not actually dangerous, (3) 'needle' Sb_2S_3, approximately 80% Sb_2O_3, is as efficient for the manufacture of primers as approximately 100% stibnite, (4) lead and iron sulphides work satisfactorily as substitutes for Sb_2S_3 in non-fulminate primers, (5) hence the presence of lead and iron sulphides in Sb_2S_3 is not harmful, (6) in case of a deficiency in the foreign supply of Sb_2S_3 the domestic supplies would serve, (7) primers made with PbS and FeS showed a higher velocity for normal pressure than Sb_2S_3.

Germany's Stolen Chemistry

By TOWNES R. LEIGH

*When we recall that Samson slew a thousand Philistines with the jawbone of an ass we intuitively wonder how many he would have slain if armed with the jawbone of a German propagandist, according to whom all things were made by Germans and without whom was not anything made that was made. To use a medical term, the modern Teuton seems to be suffering from what is known as paranoia, or the disease of an exaggerated ego. Yet, as much as the German has boasted, he has borrowed more; as much as he has talked, he has taken more. In times of peace he has seized upon the inventions and discoveries of is neighbors for exploitation, shouting as he did so, "They are mine." When chemicals and drugs have been mentioned he has waxed especially boisterous, puffed up his breast and roared, "They are mine." Indeed, they are not his any more than are the Belgians whom he has deported to till his fields and serve his forges. The first chemical works were established by Chaptal, near Montpelier, France. It is time to prick the inflated bubble of Germany's chemical reputation. I have before me a leading text-book of general chemistry, one taught in the foremost universities. Glancing down its index, my eye rests upon the word 'Law', followed by a list containing 21 fundamental laws by which the science of chemistry is governed. There I see the names of Avogadro, Boyle, Charles, Dalton, Dulong and Petit, Faraday, Gay-Lussac, Henry, Le Chatelier, Mendelejeff, down to van't Hoff—but nowhere do I see the name of a German. Italy, England, France, Russia, and Holland flash forth in the glory of their sons wherever the principles of chemistry go; but Germany did not discover one of these secrets of general chemistry. Liebig and Wöhler, who in the nineteenth century made important contributions to the branch of synthetic chemistry, received their training from the French. Germany talks fast and furiously about modern chemical industry and commerce with the hope that her clamor will cause the world to forget her debts; but, by the aid of Buckley's 'History of Natural Sciences', we see that of the 30 chief men of science of the seventeenth century only three were of German blood, and of the 27 of the eighteenth century again only three were German. During the nineteenth century the science of chemistry made greater progress than it had made in all its past history. The majority of the most important contributions to chemistry during the past century were not made by Germans. Not a component of the air he breathes was discovered by a German. Oxygen is credited to Priestley, an Englishman, who late in life settled in Pennsylvania; nitrogen, first recognized by Rutherford, a professor in Edinburgh University; carbon di-oxide, isolated by Black, a Scottish chemist and physicist; helium, krypton, xenon, and neon, discovered and first studied by British subjects—Lockyer, Ramsay, Crookes, and Rayleigh. Not an element in water was discovered by any German. Hydrogen was discovered by Cavendish, the noted English chemist, and oxygen, its other component, by Priestley, as we have already stated. Not an element in the salt with which we savor our food was discovered by any German. Its chlorine is a gift of that productive investigator, Scheele, a Sweede; its sodium, from the versatile Davy of London. The indictment which has been brought against German chemists concerning the elements in air, water, and salt may be extended to cover the elements found in 75,000 other substances, including nearly all of the synthetic compounds used in the world's trade.

There is probably no field in which synthetic chemistry has played so important a rôle as in the coal-tar dye industry. In 1739 Dr. Clayton, dean of Kildare, first distilled coal and obtained coke, tar, and gas. Less than 50 years later the Earl of Dundonald, a Scottish nobleman, obtained a patent for the extraction of coal-tar in commercial quantities. In 1792 William Murdock of England first used coal-gas as illuminant. Naphthalene, used chiefly in the manufacture of indigo, was discovered in 1820 by Garden; benzol, the parent substance of the most important dyes, was discovered in illuminating-gas in 1815 by Faraday; anthracene, largely used in the synthesis of Turkey-red, was first procured by Dumas of France; toluene, used both for making dyes and the powerful explosive T. N. T., was first obtained by Mansfield; and picric acid, also employed in the manufacture of dyes and explosives, was first prepared by Peter Woulfe, a London chemist.

In connection with these achievements, the importance of the miner's safety-lamp, invented in 1815 by Humphrey Davy, must not be overlooked, for by the use of that simple and ingenious device the danger and hazard of mining coal were largely removed. The great honor of producing the first coal-tar color belongs to W. H. Perkin, an English chemist, who, during the Easter vacation of 1856, tried some experiments. He planned to produce synthetically no less a substance than the valuable alkaloid, quinine. The attempt was a failure in so far as obtaining quinine was concerned, but he noticed that a colored product had been formed. The most interesting feature of his work was the quick perception he had of some possible value of the new substance. The dye was finally purified and given the name

*Abstract: Manufacturers Record.

mauve, by which it became familiar. For 50 years it was used in printing the English penny-postage stamp, by which means England maintained a unique memorial to her celebrated chemist, perpetuated even in the remotest part of the world, wherever her mail service may have penetrated. Not long after his first great discovery, Perkin perfected a method of manufacturing alizarin, with the result that the extraction of that dye from madder has been practically abandoned and the enormous acreage formerly devoted to the cultivation of that plant has been given over to cereals and other crops. After the synthesis of mauveine by Perkins, the synthetic-dye industry grew by leaps and bounds. Frequently methods for the preparation of the same dye were discovered independently by different chemists, and a common dye was sold under different names. For example, Verquin, a French chemist, manufactured fuchsine, and this same dye became known as magenta and rosaniline. In 1863 an Englishman by the name of Lightfoot produced aniline black, and in 1873 the first sulphur-dye was discovered by Croissant and Brittoniere of France. In connection with the development of dyestuffs, it should be recorded that to a French chemist is due the modern method of the preparation of the excellent bright-yellow dye for animal fibres. Another quality which this dye possesses is that it may be used for the detection of hemp, flax, and cotton in woolen goods, inasmuch as it does not color vegetable fibres.

Germany has exploited, but did not discover, coal-tar dyes. In 1913 she exported about 12 times as much synthetic color as was manufactured in the United States. Since the outbreak of the war American chemists and manufacturers have made far greater progress in the production of dyes than was ever made in Germany in the same length of time. It may be that America is destined to control the dye industry. At the present time a large percentage of the known coal-tar colors is being made in America, and already there is an investment of $200,000,000 for the production of colors and intermediates. American dyes have established their prestige in foreign markets, and in this respect the future is auspicious. The total domestic production of aniline dyes in 1915 was valued at $2,470,000. Our exports for the fiscal year 1917 of aniline and natural dyes were $11,710,887, an amount greater than the value of all the synthetic organic chemicals, including coal-tar dyes, imported annually into the United States before the War. Our total export of dyestuffs for the last calendar year amounted to upward of $15,000,000.

According to Leo H. Baekeland, the chewing-gum industry of the United States exceeded by several millions of dollars the value of all synthetic chemicals, dyestuffs included, imported every year into the United States. One single chain of five and ten-cent stores in 1913 exceeded by $11,000,000 the whole of the German synthetic dye industry throughout the world. In the same year the entire German color industry paid $11,000,000 in dividends, while one American company with a single standardized product—the Ford motor-car—did a greater annual business than all the German coal-tar dye plants together, with their 1200 different products, and earned four times their combined dividends while paying three times their wages.

As far as the mineral chemical industries are concerned, America, even before the War, could stand comparison with Germany or any other country. When it came to the production of acids and heavy chemicals, we were decidedly ahead of Germany. Especially was this true of our important electro-chemical industries.

The manufacture of synthetic dyes is only one of the many ideas that Germany borrowed from her more resourceful neighbors. The very chemicals which she uses to prosecute her war were not first produced by the subjects of the Kaiser. Howard, an English chemist, first made the fulminate of mercury; Schoenbein of Basel, Switzerland, guncotton in 1845; Sobrero of Turin, Italy, nitro-glycerine in 1846; Alfred Nobel of Sweden, dynamite in 1856 and blasting-gelatine in 1878; Veille of France, military smokeless powder in 1886; Alfred Abel of England, cordite; Egg, likewise an Englishman, devised the percussion cap; Picford, his compatriot, the safety-fuse, in 1831; and it was Venvenuto Cellini, an Italian, who introduced the blending process in gunpowder. Chlorine gas and a dozen other chemicals of modern warfare were not first 'Made in Germany'; and finally, we have it on the authority of Charles E. Munroe, a specialist on explosives, that out of 62 names of experts on explosives two stand supreme—that of Abel of England and of Bertholet of France.

Though Germans say much about the fixation of nitrogen, what credit do they deserve for its development? As long ago as 1784 the English chemist, Cavendish, observed that when electric sparks were passed through the air the oxides of nitrogen were formed, and by absorbing these oxides in water or in alkalies, nitric acid or nitrates could be produced. However, his discovery lay dormant until the demand for nitrates increased to such a degree that it became evident that the natural deposits of these substances were in danger of being exhausted before many years. In 1898, Sir William Crookes, president of the British Association, delivered the solemn warning that the years of plenty were passing and before long the greatly increased intensive cultivation would use up all the known sources of combined nitrogen and there would be no Egypt from whose granaries supplies could be obtained. Commercial chemistry was rapidly increasing its demands for nitrogen compounds in the manufacturing of dyes, explosives, ice, soda, and cyanides, the last being used in the extraction of gold from its ores and in the plating of metals, yet the source of supply of native nitrates showed no such elasticity. The Englishman's warning caused chemists and manufacturers to turn their attention to that important field. The first to solve successfully the problem of the combination of atmospheric nitrogen on a commercial scale were two Norwegians, Birkeland and Eyde. Other methods for the fixation of nitrogen commercially have since been developed. Our Government is

now spending millions of dollars in the construction of nitrate plants which are destined to place us in the forefront among the nations of the world in this particular field.

Few of the valuable chemical processes were developed by German brains. The Lablanc method of making soda-ash directly from salt was devised by a Frenchman in behalf of his country and named in his honor. The Solvay method, now more generally used, was perfected by a Belgian and bears his name. Soda-ash is employed in the manufacture of glass, soap, and many chemical reagents, and the enormous quantity of 2,250,000 tons is produced annually. The soda-process for making paper from wood-pulp was patented by Watt and Burgess of America. The sulphite process for the production of fats by steam at high temperature, largely used in the manufacture of soap, were the work of another American, R. A. Tilghman. The cyanide process of obtaining gold and silver was conceived by McArthur and Forest. The process of obtaining cheap aluminum was devised by C. M. Hall, also an American, while Cowles of Cleveland produced aluminum bronze. The process of making carborundum and graphite in commercial quantities was the work of E. G. Acheson. The French and the Americans were the first to manufacture ice by the use of liquid ammonia. The process of the softening of water was worked out by Clark of Aberdeen, Scotland. The filtration of water for public use was first carried out by James Simpson of the Chelsea waterworks, London, England. The de-colorizing power of vegetal charcoal was first noticed by Lowitz of St. Petersburg, and that of animal charcoal, the basis of the modern refinery, by Figuier of Montpelier, France. The process of hardening fats by the use of hydrogen we owe chiefly to an English firm, Messrs. Crossfield & Son. By their process whale-oil is now converted by large amounts into solid material suitable for the manufacturing of soap. The important contact-process, which is largely used in the manufacture of sulphuric acid, has been developed upon the observation made as far back as 1831 by P. Phillips, a vinegar merchant of Bristol, that the oxidation of sulphur di-oxide is greatly accelerated by the presence of platinum. The Englishman, John Mercer, taught us to mercerize cotton; the Frenchman, Chardonet, the process of making artificial silk. This method, however, by which most of the imitation or artificial silk is made at the present time is the viscose process, invented by the English chemists, Crass and Bevan, in which wood-pulp is used. H. Mege of France gave us oleomargarine; malted and condensed milks are distinctively American-born and developed products. Hyatt of America gave to the world celluloid.

To M. Verneuil of Paris we are indebted for the artificial ruby, the real ruby of science, which is as much the ruby of Ceylon and Burmah as is the water formed by burning hydrogen the water of the rain—identical in property and composition. In a small factory in the Rue Lafayette is to be found the commercial production of rubies on so cheap a scale as to decree the doom of the ruby mine, a doom as certain as that decreed by the synthetic dye to the indigo industry of India. To Henri Moissan of the Sorbonne, who produced tiny artificial diamonds, belongs the honor of the art and practice of electro-metallurgy, for, while other men have done things before and after his work, he made 300 contributions of new substances in the electro-metallurgical field. In the ever-widening circle of factories that surround Niagara Falls are to be found the greatest high-temperature industries in the world.

Very different from the dye, explosives, and other synthetic products just described is the remarkable substance produced by the American chemist, L. W. Baekeland, and which has quickly acquired a great industrial value. This substance, called Baekelite, is synthesized from phenol and formaldehyde; it is infusible, insoluble, an excellent substitute for amber, the best of insulators for electricity, and, though more durable than celluloid, it is not inflammable and is less expensive.

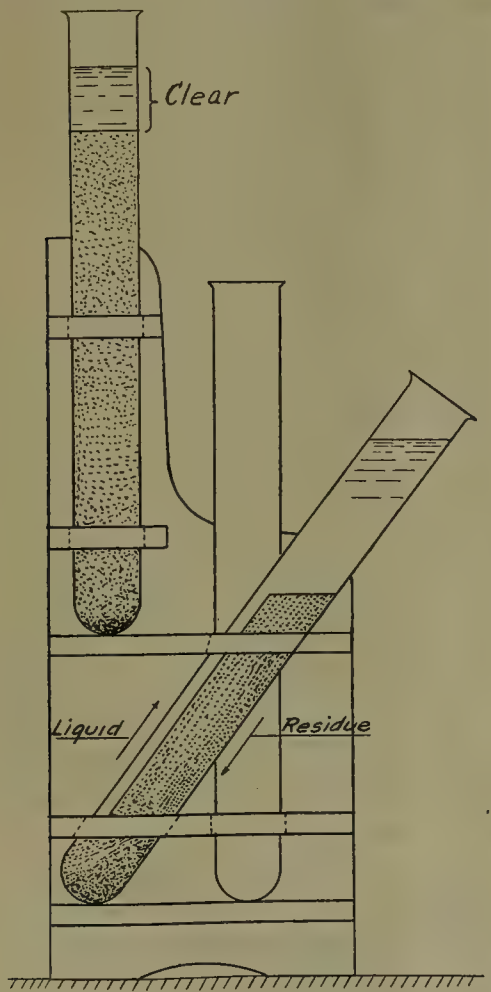
LEAD ROOFING was found by J. S. S. Brame, as stated in the 'Journal of the Society of Chemical Industry', to be corroded only where in contact with oak beams, and not at all where in contact with pine roofing. The composition of the corroded part was identical with that of common white lead. It has been previously recognized that in constructing sulphuric-acid chambers, lead and oak should not come into contact, perhaps on account of the acetic acid in the green oak. In a second case, lead roofing in contact with a coke-breeze concrete corroded fairly rapidly. The corrosion-product was red in color and contained a higher oxide than PbO. The action is probably due to the presence of hydrated lime in the cement. It has been suggested by others that calcium plumbite or plumbate might be the initial product formed. It was pointed out that the action was well known to plumbers and to cable companies, though never fully explained. It might be due to the presence of small amounts of free alkali. Metallic lead should never be used in contact with lime, mortar, or cement. The corrosion-product, is, however, generally white in color and contains no higher oxide of lead.

THE New Zealand Quicksilver Mines Co.'s property, formerly known as the Whangarei Cinnabar Co., is situated in the Whangarei district, 90 miles north of Auckland. At the outcrop the ore-shoot measured 30 ft. along the strike in the lowest workings. As far as proved it is 150 ft. in length, and still persists. The average width is 3½ ft. with a dip of 35°. The average from 310 tons treated is 2% mercury. The ore is calcined in a small Novak shaft-furnace. The total output is 11,000 lb. Owing to war conditions and the scarcity of labor the property is only being worked in a small way. The company holds an area of 450 acres, and cinnabar can be found in various places over a length of over half a mile beyond existing workings. Negotiations are under way to secure additional capital to develop fully the property.

Decanting

By H. TILLISCH

The decanting of liquids from residues is generally a tedious operation. The time required for the separation can be much abbreviated without mechanical means, if the tube simply be held in an inclined position, at an angle of 45°. The liquid will then form a channel in the upper part of the tube, while the residue will go along the under part to the bottom. In this way the two



RAPID SETTLING BY INCLINED TEST-TUBE

currents, upward and downward, will be separated from each other. The decantation can thus be finished in one-third the time required by the usual method with vertical tubes. It is common practice to use narrow inclined tubes for obtaining a rapid decanting in liquids or for separating dust from air. The same principle can, as shown, be of use in the laboratory. The common tube holders ought to be slightly modified for easy decanting in inclined tubes. The modification is suggested in the diagram.

[The method described by Mr. Tillisch is not new, but perhaps is not widely known. Better results are obtained when the tube is inclined at an angle of 60°. The principle is that the solid in suspension has but a short distance to fall before coming to rest, and its settling is not affected by eddies or cross-currents. As soon as it has reached the inclined tube-wall it slides downward. The rising current is induced by this motion, but, its velocity being due to displacement, it lacks the power to pick up the substance that displaced the water. Therefore the sediment accumulates at the bottom of the tube. This principle has long been applied in the inclined-baffle settling tank used in the metallurgical and chemical industries. Descriptions of the apparatus may be found in Richards' 'Ore Dressing' and other treatises on concentration.—EDITOR.]

AMMONIA has been oxidized to HNO_3 in quantity at the plant of the Gas Light & Coke Co. at Beckton, England. Experiments with several types of platinum catalysts led to the utilization of four layers of platinum gauze pressed tightly together and fitted into an aluminum frame with asbestos gaskets. There is first inserted under the gauze a platinum coil carrying a small current that heats it to redness and brings about the reaction with the assistance of a little auxiliary NH_3 to enrich the mixture. Once under way the reaction sustains the required heat in the gauze. Air is provided in the ratio of about 10 volumes to 1 of NH_3 by a Keith-Blackman blower at 6 inches of water-pressure. The NH_3 gas, after passing through a Bryan-Donkin reducing-valve, passes through the regulating-valve and a specially constructed Thorpe's meter, thence into the air-pipe and to the converters. The rate of flow of the mixture is carefully adjusted to keep the gauze hot, but with sufficient velocity to let any NH_3 pass through unconverted. The normal percentage of efficiency is better than 90.—'Gas World.'

POTASH production for the first six months of 1918, according to the U. S. Geological Survey, shows a total output of 20,000 to 25,000 short tons of pure potash (K_2O), indicating that the output for the entire year may reach 50,000 to 60,000 tons. As only 32,573 tons was produced in 1917, production is evidently increasing rapidly. The domestic production now equals 20 to 25% of the normal domestic consumption before the War, which is estimated to have been about 240.000 tons. The statistics for the first half of the year are not complete, as returns have not yet been received from a few large producers, and it is possible that the production in 1918 may exceed 60,000 tons, for reports made to the Survey indicate that a number of new enterprises may be put into operation during the second half of the year.

GOLD PRODUCTION of the Rand for the first half of 1918 compares as follows with the same period of 1917:

	Half-year, 1918	Half-year, 1917
Ounces	4,256,334	4,418,298
Value	£18,079,762	£18,767,732

Californian Mining in 1918

*In almost every year since the days of the forty-niners, California has led all others in the production of gold, and its total output to the end of 1917—$1,672,681,941—is far greater than that of any other State; yet, according to C. G. Yale, of the U. S. Geological Survey, the output of gold in the State is decreasing from month to month. This decrease is due not so much to the exhaustion of the placers, orebodies, or veins, as to war conditions, including the loss of miners, for many who formerly worked in gold mines are now prospecting or mining metals and minerals that are immediately needed to make munitions of war. Gold mining seems to be the only mineral industry that is losing ground in California, for the value of the total mineral output of the State is now greater than ever before.

During the first six months of 1918 the U. S. Mint at San Francisco, and the local smelters and refiners, to which most of the newly mined gold in California is sent, received from mines in the State $1,174,500 less gold than during the first six months of 1917. Moreover, the decrease in the output for the last half of the year is likely to be still greater, for many mines are closing down or are curtailing operations.

The output of the deep or quartz mines, in 1917, dropped 14 to 20%, and was still further reduced during the first half of 1918. The output of the placers, especially of the dredges, was increased about 6% in 1917, but will decrease in 1918. The dredges now produce more than 90% of the placer gold of California. The deep or quartz mines, which formerly produced 62 to 64% of the total gold, are now producing about 55%, and at the end of 1918 will be producing still less. Skilled labor in the mines not only costs more but is harder to get and keep, as many of the best men have gone into shipbuilding or other industries, where higher wages are paid. Thousands of the younger men have gone into the Army or Navy. All the operators complain that they are compelled to employ old men and boys, who are much less efficient than the men who have left. The output of ore is therefore materially reduced. Copper mining has been so prosperous that gold miners of the better class have been attracted to that industry, not only in California but in Nevada, Arizona, and other States.

In the Grass Valley district, Nevada county, the most productive deep-mine gold district in California, the cost of mining and milling ore is said to be $1.15 per ton more in 1918 than it was in 1917. The average value of the ores mined in that district is the highest in the State, yet the average value per ton of the ores from fourteen of the mines was only $7.84 in 1917 as compared with $9.10 in 1916. The profit at the mines in the Mother Lode counties, which supply 46% of the total milling ore, is very small, for the ores are generally of low grade. In 1917 the mines in these counties produced 1,236,903 tons of ore, which yielded an average of $4.19 per ton. Although an immense quantity of ore was milled, the increased costs and the narrow margin of profit have compelled several mines to close and others to curtail operations. If the operators of such mines can manage for a time to make their receipts balance their expenses they will be satisfied, for the cost of re-opening a large mine may be absolutely prohibitive. The manager of one of the larger Mother Lode mines, which produces an average of $700,000 per year in gold, has calculated his costs per ounce in gold, instead of per ton of ore, and he finds that the gold from his mine cost him $12 per ounce in 1915, $14 in 1916, $16 in 1917, and about $20 in 1918.

In Amador county the South Eureka Co. has permanently discontinued work on the South Eureka and the Oneida mines, both of which have been worked for many years. The Argonaut shaft is being sunk to a depth of 5000 ft. In Butte county the Pacific Gold Dredging Co. has worked out its ground in the Oroville district, although it is still working in other districts. In Calaveras county work at a number of placer mines, including those of the Stockton Ridge Co., has temporarily been discontinued. In Marin county the Chetco copper mine has become a producer after 40 years of idleness. In Mariposa county new equipment has been placed on the Mount Gaines group and changes have been made in milling to reduce costs. In Nevada county the old McGuire hydraulic mines at Lowell Hill, near Dutch Flat, are under new ownership, and a concrete dam to retain the tailing is to be built on Bear river. In Shasta county a new dredge has been set to work on Clear creek 3 miles below Redding. The American Dredge Co. has bought 1000 acres of the Menzer ranch, near Redding, at the mouth of Middle creek, where dredging was once profitable. In Sierra county the Brandy City Hydraulic Mines Co. is building a concrete débris dam at Bullards Bar, on North Yuba river. After an idleness of about 30 years the hydraulic mines at St. Louis and Howland Flat resumed work by building a big débris dam on Slate creek near American House. The placers at Poverty Hill and near Port Wine will be reached by a tunnel. In Siskiyou county the work at placers on Orleans bar and in other places was reduced this year, owing to scarcity of water. The Hazel gold mines, near Hornbrook, were re-opened and newly equipped after having been shut-down four years. In Trinity county the Trinity Star Dredging Co., at Lewiston, suspended work on its boat owing to shortage of labor and other adversities. The largest gold dredge in the northern part

*U. S. Geological Survey Bulletin.

of the State, owned by the Pacific Gold Dredging Co. at Carrville, on Coffee creek, ceased work entirely about the end of June. The Trinity Gold Mining Co., which owns the Headlight mine at Trinity Center, has found work unprofitable and has dismantled its 40-stamp mill and 200-ton cyanide plant. The Estabrook Dredge Co. has abandoned its smaller dredge at Trinity Center but will build a new one. In Tuolumne county the Eagle-Shawmut mine, owned by the Belmont Co. of Nevada, has put in ball-mills in addition to its 70 stamps, and has also added a flotation plant.

Most of the silver output of California is derived from copper and lead ores, although the gold bullion from deep and placer mines also yields silver. In the first six months of 1918 the output of silver was about 32,000 oz. less than in the corresponding period of 1917. Renewed activity, however, in the old silver camps of Darwin, Keeler, Calico, and other places in the southern part of the State is apparent since the rise in the price of silver.

During the first half of 1918 copper, lead, and zinc mining in California have been much more active. In 1917, as compared with 1916, there was a decrease of about 14% in the output of copper and of 2.9% in zinc, but an increase of 7.6% in lead. The only one of these metals that appears to show an increase during the first six months of 1918 is zinc. One of the largest copper mines, which had 700 men underground last year, has lately been employing less than 200. High cost of transportation has closed the Afterthought copper mine, in Shasta county and the Gray Eagle mine, in Siskiyou county. In the Blue Ledge region, in Siskiyou county, considerable copper has been mined, but restriction on transportation has hampered work. The Mountain Copper Co. has doubled the capacity of its flotation plant at Minnesota. The Bully Hill mine, in Shasta county, is concentrating by flotation. The Engels mine, in Plumas county, has enlarged its flotation plant, and the Walker mine, in the same county, is now operated by the Anaconda Copper Co., of Montana, which is shipping flotation concentrates to Tacoma. Copper mining is active in the region adjacent to Smartville, Yuba county, and Spenceville, Nevada county. Shasta county has taken the lead in the production of zinc in California, and, all minerals considered, it continues to be the most productive county in the State. A large quantity of zinc is also being produced in Inyo county.

Platinum has been actively sought and saved in California this year, principally at the gold dredges, where it has been recovered in larger quantities by improved appliances.

Metal Mines of Oregon in 1918

Receipts from Oregon at the Mint, smelters, and refineries at San Francisco show a decrease of $122,000 in gold and 13,000 oz. of silver for the first six months of 1918 as compared with the corresponding period of 1917, according to Charles G. Yale, U. S. Geological Survey. By no means all the gold and silver mined in Oregon is sent to San Francisco, but the proportion that is sent indicates the condition of the mining industry of the State. Oregon, like the other Western States, has been forced to reduce its output of gold by the present high cost of supplies, the scarcity of skilled labor, high freights, lack of investors in gold-mining enterprises, etc.

The statistics for 1917 showed a material reduction in the output of the metal mines in Oregon as compared with that of 1916. The quantity of ore taken from the deep mines was materially reduced, and the production of gold decreased more than 25%. The production of silver also decreased, and more than 30% less copper was produced than in 1916. There are now only between 70 and 80 producing mines in Oregon, most of them placer mines. Baker and Grant counties are the leading producers in the State and they have gained their position by dredging, yet even the dredges, hydraulic mines, and drift and surface-placer mines are making a reduced output, but the greatest deficit is in the production from the deep or quartz mines.

In the Gold Hill region the shortage of skilled miners and millmen has prevented resumption of work at the Millionaire, Nellie Wright, and some smaller mines in the district. The lessees of the Sylvanite mine bought the 10-stamp mill of the Gray Eagle and transferred it to the Sylvanite. The McKinley copper mines, consisting of twelve claims 12 miles east of Gold Beach, have been sold to the Takilma Smelting Co. The Chiles Mining Co., operating the Emery gold mine, 12 miles east of Harbor, was forced to close this year owing to the difficulty in procuring supplies, principally gasoline. The once productive Ben Harrison mine, in Baker county, which was under option, was returned to the original owners after the holders of the option had spent considerable money in investigating it. The Mountain Lion mine, 12 miles south-west of Grants Pass, has been sold, and the new owners will put in Lane mills. Improvements and larger reduction-works are being installed at the Almeda copper mines, on Rogue river 27 miles below Grants Pass. The Gold Bar mine, on Rogue river below Grants Pass, operated three hydraulic giants and a steam-shovel this year. The average value of the ore mined in Oregon and the quantity of ore treated is less than in former years. In the south-western counties of Oregon, which form a continuation of the Californian gold belt—Coos, Curry, Douglas, Jackson, Josephine, and Lane—a reduced output from both placers and deep mines is apparent, and some of the mines have been closed. The metal-producing counties in north-eastern Oregon are Baker, Crook, Giant, Malheur, and Wheeler, and, of the gold output of these counties, Baker has contributed about 94%. The output of gold from placers in these counties in 1917 was 14% less than in 1916, and that from lode mines was 25% less. Baker county shows the largest decrease in output, but Grant county, owing to the work of a new dredging enterprise, shows a material increase in the production of gold. The outstanding feature of metal mining in Oregon is the reduction in the number of productive mines, which was 29% less in 1917 than in 1916.

PLATTEVILLE, WISCONSIN

Zinc, Lead, and Pyrite Markets During August.

Prospects for a satisfactory month were not too brilliant at the beginning of August, but as time passed much improvement was shown over the July returns, and the past month was one of the best this year. Prices for zinc ore at the beginning were unsatisfactory, but they got better about mid-month, and considering all sales made the average was fair. Standard grades of concentrate, assaying under 60% zinc, ranged from $50 to $55 per ton, the latter figure being reached in the last week. Second-grades were classed at 52%, below which buyers established a lower basis of calculation. The low-grade products diverted to refiners were in better demand; and 30% ore, the basis, was bid in at $22.50, at which price a fair quantity of the reserve in the field was sold.

The most interesting news during the month came from a prominent producer, who stated that buyers of low-grade zinc ore, connected with the two acid plants being built in the field, had tried to obtain the output of his mines under contract arrangements, and that a new basis of settlement was proposed; that not only would payment be made for the zinc content of the ore at prevailing rates, but payment would also be made for the sulphur content of the ore. In other words, that which heretofore had been penalized would now afford a premium. Miners who have been selling low-grade zinc ore seemed delighted over the chance to dispose of ores on such a basis.

Labor conditions improved little. Skilled men were in good demand, and large producers claimed that their desires for this class of miner had been satisfied. Wages were increased at several points, and many farmers returned to the mines as soon as the harvest was over, attracted by the increased pay. There was little prospecting work carried out anywhere. Several new mills were started, and fully-developed new mines took the place of old producers. In the Linden district all the mines were completely shutdown, three out of ten producers having been abandoned permanently. In the Benton district several large mines operated with reduced forces. The maximum monthly capacity of the field, conservatively placed at 6000 short tons, under favorable conditions, has been reduced to 55%, at which point it is likely to be held until demand for ore improves, as well as prices. Power-plants demanding increased rates before the State Industrial Commission, had their demands granted, but not until operators had protested to their limits.

Lead producers fared exceptionally well, prices for August continuing at the $100 per ton basis of 80% metal, above which price buyers refused to advance. Not until the close of August were reports current that slightly better offerings had been made; but this developed on premium-grade lead concentrate. Production was better, on account of the increased milling of zinc ore and the output from several exclusively lead mines. A careful estimate showed over 1500 tons held in reserve at the close of the month. Some outside buying influence came into the field, but most of the ore was secured by the Federal Lead Company.

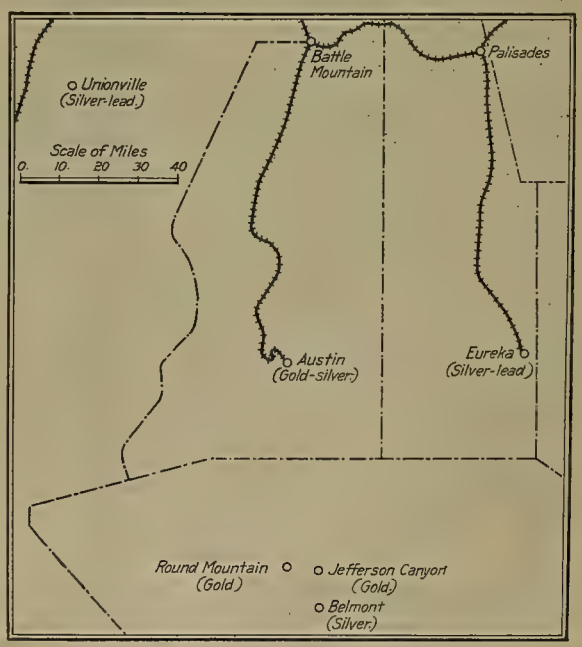
Shipments of iron pyrite came almost entirely from the zinc-ore separating-plants. Open-market sellers fared to better advantage than those selling under contract, the price paid being 25c. per unit, per long ton. Miners thinking that two new acid plants would make a demand for this class of ore in the Wisconsin field were given little encouragement, as the acid-making process to be employed uses sulphur fume from low-grade zinc ore. The quota of pyrite now sent out of the field to concerns not engaged in ore separation will have to be made up, so it appears that there will be a market for independent producers later on.

Deliveries of ores from mines to refining-plants in the field, and from mines to smelters direct, for August were as follows: 16,581 tons of blende, 704 tons of lead, and 3339 tons of pyrite. Shipments of high-grade separator product, made in the field, was shipped in larger quantities, totaling 9020 tons.

RENO, NEVADA

Development in the Eureka, Jefferson Canyon, Pioche, Peavine, Unionville, and Goldfield Districts.

Old mines of the Eureka district are being re-opened, largely through operations of the Eureka-Croesus company,



CENTRAL NEVADA, SHOWING DISTRICTS BEING REVIVED

which has secured title to a number of the early-day producers. In August it shipped ore to the value of $75,000, according to receipts from the sampler. Development is said to have exposed large bodies of high-grade milling-ore, and a flotation plant of large capacity is proposed. Eureka is credited with a production second only to the Comstock

among Nevada silver-mining districts, and during the busy period early records show that the minimum value of ore extracted was $30 per ton.

At Jefferson canyon, in Nye county, the Jefferson Gold & Copper Co., working the old Kanrohat mine, will discontinue the use of flotation and will restore the cyanide plant, having obtained far better results with the latter process. The change will involve extensive construction of launders to convey the tailing and waste solution out of the canyon in which the mill stands, in order to avoid damage to the Round Mountain water-rights. The manager, S. H. Brady, who is in New York, reports that a large tonnage of high-grade milling-ore has been blocked out by four tunnels, the deepest giving backs of 1000 ft. on the vein. The Kanrohat and adjoining mines were large producers of silver many years ago, but were developed only by shallow workings and were able to market only the richest ore.

At Pioche the Virginia-Louise mine is shipping ore to a smelter in Utah. The present rate is two carloads daily. A large amount of work has been done, and the manager reports a substantial tonnage of marketable ore available.

Recent work in the Peavine district near Reno, in Washoe county, is said to have resulted in opening a considerable quantity of milling-ore. Exploitation hitherto has been confined chiefly to surface prospecting, with rather unfavorable results.

Mine and mill equipment is being hauled to the old Arizona mine at Unionville, in southern Humboldt county, now being worked by the Sunset Mining & Development Co., under the management of F. W. Lockman. Some of the early-day mine workings are still in such shape that they can be re-opened. The mine has been drained to a depth of 400 ft. by a tunnel, giving access to the veins below the deepest of the old drifts and stopes. The mill now under construction will be equipped with stamps, tube-mills, and flotation apparatus.

At Goldfield recent development in the ground of the C. O. D. Consolidated company is considered among the most important of late. Part of this property, including most of the Gold Bar claim and part of the Victor, is being worked under lease by a group of Goldfield men. The manager is E. A. Ludwick, well known in Nevada. Working from a 125-ft. winze below an east drift from the Gold Bar shaft on the 65-ft. level, the lessees have opened an orebody for a distance of 35 ft., varying in width from 5 to 12 ft. Ludwick says that his lowest assay from this ore is $84, and that he has broken two carloads of $200 ore, in addition to 75 sacks of high-grade, some of which assays over $1 per pound. Ore sacks were not available at Goldfield, and the lessees were compelled to buy canvas and make their sacks. On the 200-ft. level they have exposed ore said to assay from $30 to $70 for a distance of 200 ft., and have a carload of this ore ready to ship. A merger of the C. O. D. and Blue Bull companies was proposed a year ago, together with a project to sink a 3000-ft. shaft on the latter property. This plan was abandoned because of war conditions, but is still being considered.

TORONTO, ONTARIO

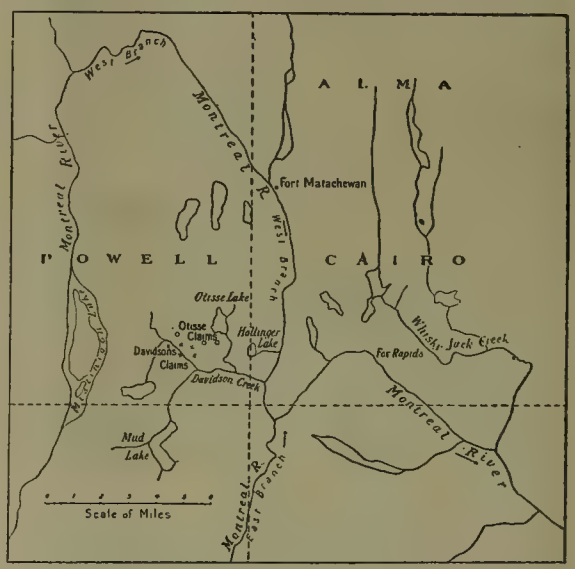
Price of Powder Doubled.—Notes from Porcupine, Matachewan, Boston Creek, and Cobalt.

The price of blasting-powder is a heavy charge that affects gold mining, and has much to do with the present depressed condition of the industry. The price of powder has doubled within the last five years. According to a statement by one of the gold-mining companies, the ruling price on 40% powder, that mostly used, has risen from $13.10 per 100 lb. in February 1913 to $26.70, or double. Mine-owners may request the Government to investigate the matter in hope of obtaining relief.

Boston Creek.—Great progress is being made here. The Miller-Independence has opened a vein carrying calaverite (telluride of gold). The vein is 11 ft. wide, said to average $300 per ton over this width. The shaft is down 100 ft., and ore has been exposed by drifts for 65 ft. The adjoining claims owned by S. J. Renaud, A. B. Cullen, and Peter McGinley, have been taken over on option by R. W. Norrington, representing Detroit interests, the price being reported as $250,000. Another adjacent property has been bought by Charles Millar and C. A. Gentles, of Toronto, for $25,000. It is understood that active exploration of both these properties will be started at once.——The Mekks Syndicate is making preparations for development.

Cobalt.—The Mining Corporation has taken over the Ophir Cobalt mine under an option to purchase a two-thirds interest for $150,000, agreeing to spend not less than $2500 per month on development.

Matachewan.—This goldfield is the principal centre of attraction at present, owing to recent rich discoveries. The most important was found in trenching and sinking test-pits on four claims south of the Otisse, which are being worked by the Nipissing company of Cobalt. A mass of gold was taken out, valued at $600. The Otisse is the only property on which any considerable amount of exploration has been accomplished. Six diamond-drill holes have been bored, the deepest being 600 ft. Machinery has been put in, and shaft-sinking will begin shortly. Some high-grade ore has been extracted from surface operations.



SKETCH OF MATACHEWAN GOLD DISTRICT, ONTARIO. PORCUPINE IS 45 MILES NORTH-WEST; BOSTON CREEK IS 35 MILES EAST; COBALT IS 65 MILES SOUTH-EAST.

Porcupine.—At the Dome Mines, development on the 1250-ft. level is progressing steadily with satisfactory results. A raise is being driven to the upper workings, an indication that the expected orebody has been found; but the management is reticent.

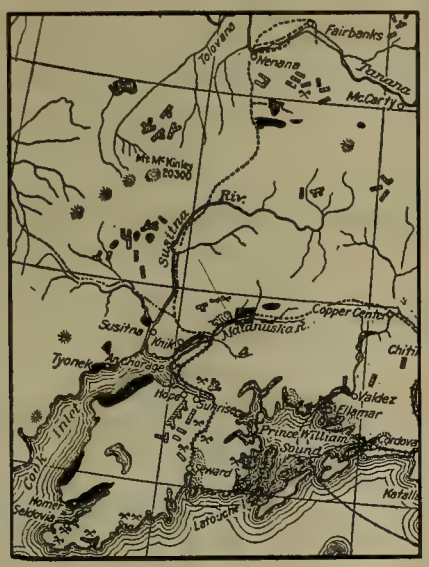
At the Davidson a new section is being developed. A second shaft is being sunk to 750 ft. from a point 300 ft. north of No. 1. Diamond-drilling discovered an orebody at a depth of 544 ft. It was 30 ft. wide, giving high assays.

The contract under which underground work on the Thompson-Krist is being carried on from the adjoining Vipond-North Thompson mine has almost expired, and as the latter company is doing no work in its own property, the contract is not likely to be renewed.

THE MINING SUMMARY

ALASKA

Anchorage.—The railway between this place and Seward is complete. Some difficult engineering was overcome in



PART OF ALASKA, SHOWING RAILROAD ROUTES.

construction. Coal from the Matanuska field can now be hauled to Seward, a distance of 190 miles. The Department of the Interior states that 60% of the Alaskan Railroad is finished.

ARIZONA

Ajo.—New Cornelia produced 3,928,000 lb. of copper in August, a gain of 28,000 lb. on July.

Bisbee.—Phelps Dodge Corporation pays $8 per share on September 30. This makes $22 for 1918.

The number of applicants for loans from the mining companies to build homes in the Warren district under the new plan has so far exceeded expectations.

Clifton.—Arizona Copper Co. produced 4,300,000 lb. in August, 3,000,000 lb. more than in July.

Globe.—The Iron Cap Copper Co. pays 25c. per share on October 1. This amounts to $28,130.

Jerome.—It is reported that steam-shovel operations are to take place on top the the United Verde orebody. A contract has been let for construction of a two-mile railway to the area. All buildings on the proposed site are to be removed.

Tucson.—Rifle and artillery range wastage, amounting to 35 tons, has been shipped to Tucson for reduction at the Arizona Rare Metals Co.'s plant, which has been altered to treat such material. This plant closed down after the slump in molybdenum.

CALIFORNIA

Bishop.—It is reported that George Brown and others have sold 69 claims, 10 miles west of Brown station, to George Wingfield and others, for a large sum. The property contains large deposits of low-grade gold ore. Seventeen men are employed. An auto-road is being constructed.

Eureka.—According to the 'Humboldt Standard' of September 16, W. B. Thompson, well known in mining circles, has suggested construction of a railway between Hornbrook and Yreka in Siskiyou county, along the Klamath river, possibly connecting with either Eureka or Crescent on the coast. The length would be 270 miles. The line would pass through the chrome and gold areas, also a great timber belt.

Idria.—The New Idria Quicksilver Co. pays 50c. per share on October 1, equal to $50,000.

Plymouth.—The Plymouth Consolidated reports as follows for July:

Ore treated, tons	11,000
Yield, including concentrates	$62,000
Working expenses	34,000
Development charges	8,200
Surplus	20,000
Capital expenditure	3,600

The following is an extract from the superintendent's (J. F. Parks) mailed report regarding development for the month of June: 2600-ft. level: north foot-wall drift extended 75 ft. (total 521 ft.); assays averaged $2.22 per ton for a width of 4 ft. 5 in.—2150-ft. level: north foot-wall drift extended 69 ft. (total 744 ft.); formation was slate and sandstone.—2000-ft. level: north foot-wall drift extended 47 ft. (total 402 ft.); formation was foot-wall slate.—1500-ft. level: east branch drift off south drift extended 82 ft. (total 146 ft.); 19 ft. of which averaged $13.70 per ton for a width of 1 ft. 6 in.—1400-ft. level: rise at 617 ft. south extended 50 ft. (total 106 ft.); assays averaged $8.80 per ton for a width of 5 ft. 7 in. East branch drift south started at 642 ft. south and advanced 8 ft.; assays averaged $7 per ton for a width of 3 ft.—1200-ft. level: main south drift extended 106 ft. (total 1632 ft.); assays averaged 90 cents per ton for a width of 3 ft. 1 in.—1065-ft. level: rise at 855 ft. south started and put up 39 ft.; assays averaged $4.30 per ton for a width of 3 ft. 2 in.—950-ft. level: rise at 972 ft. south started and put up 46 ft., the last 4 ft. averaging $9 per ton for a width of 1 foot.

On August 27 the London office of the company reported that on the 1500-ft. level, the south shoot of ore had been exposed 90 ft. long, and 54 in. wide, averaging $11 per ton. The face was 96 in. wide.

Winthrop.—The management of the Bully Hill mine announces that the new flotation plant will be ready to start early in October.

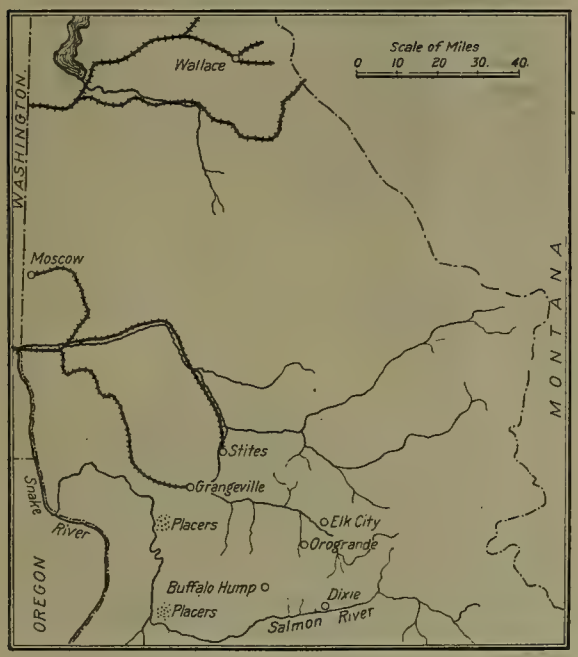
COLORADO

Colorado Springs.—The Colorado Bankers Association met here on September 14, and resolved that a committee of three be appointed by the president to attend the annual meeting of the American Bankers Association to be held at Chicago, September 23. This committee was to urge the American Bankers Association to recommend to the United States government the payment of a bonus on all gold produced during the present high cost of labor and supplies.

Also that the secretary of the Colorado Bankers Association was instructed to communicate to the Treasury Department at Washington the urgent necessity of immediate relief to the gold industry.

IDAHO

Elk City.—According to Francis A. Thomson, dean of the School of Mines at Moscow, in central Idaho the North-West possesses one of the greatest undeveloped potential gold-producing areas in America, but this great resource will remain locked until adequate means of access are available. During August he visited Buffalo Hump, Concord, Calander, Orogrande, Elk City, Dixie, Golden, and the Ten-Mile districts. In all of these the important typical and best developed properties were visited and studied. While systematic detailed sampling was impossible, representative



CENTRAL IDAHO, SHOWING GOLD DISTRICTS WORTH ATTENTION.

samples were taken at practically all properties sufficient to give at least a qualitative estimate of the value of the ore exposed. In addition, sampling data collected by other engineers, mill and smelter returns, etc., were made available for his inspection and reference. The gold deposits are of two types. The first includes the normal, typical, quartz veins, which are characteristic of large masses of granitic rock. These veins may be large or small, rich or poor, continuous or discontinuous. In central Idaho an astonishingly large number of them are mineralized, that is, they show pyrite or other sulphides commonly associated with gold, or where oxidized, the characteristic residues from these sulphides. These typical quartz veins occur both in the granite and in the gneiss. Nearly all of them are gold-bearing and the production of lode gold from this region has come almost entirely from this type of deposit. The second type, known locally as the dike deposits, are somewhat less common, and while not responsible for much of the lode gold so far produced maye prove eventually to be the more important. Nothing but placer mining or bonanza quartz mining can thrive under the present transportation and other conditions. The placers of central Idaho have been exhausted, and the cost of development has prevented all but the most surficial bonanzas being discovered. From these, $3,000,000 of lode gold has been produced. Throughout the whole region no workings were found deeper than 450 ft., and at this point the district has been marking time for 10 or 15 years. Furthermore, there is no reason to think that the district will not continue to mark time until some reasonable method of transportation is available, such as the proposed auto-road up the south fork of the Clearwater from Grangeville or Stites.

Wallace.—According to Robert N. Bell, State Inspector of Mines, resently returned from Butte and interviewed by the 'Miner,' the mine ventilating-system at that centre, one for circulating fresh air through intricate underground workings, is similar to that of the big coal mines in the East. It is especially adapted to Coeur d'Alene conditions. It consists essentially of smooth-lined main conduits, with plenty of blower capacity, plenty of electric motors, and plenty of substantial air-doors to direct its equal distribution underground and exhaust back to the surface. There are no natural rock temperatures in the Coeur d'Alene deep levels exceeding 80°, where workings have almost equaled those of Butte. Some local spots of higher temperatures than 80° are found here, but occur far above bottom levels and are doubtless largely due to slow local earth movement. A big improvement has been made in ventilating conditions at most of the big mines of this district in recent months. This includes the Morning mine at Mullan, where the company is now delivering over 200 cu. ft. of fresh air per minute per man employed to its deepest stoping level, No. 18, which is considerably in excess of the standard per man requirement of the Pennsylvanian coal-mine law.

KANSAS

Baxter.—Production of this district last week was 2167 tons of blende and 445 tons of lead, valued at $175,020.

MISSOURI

Joplin.—Production of the Tri-State region last week was 10,210 tons of blende, 436 tons of calamine, and 1940 tons of lead. The total value was $788,606. Missouri contributed $128,486. The total for 37 weeks is $18,209,479.

MONTANA

Butte.—Davis-Daly produced 705,093 lb. of copper and 31,922 oz. of silver in August; 4644 tons of ore was smelted. This is an increase of 80,000 lb. over July.

According to Robert N. Bell, State Inspector of Mines for Idaho, who recently visited Butte, with natural rock temperatures of 100° at the bottom of the deeper workings to contend with, ventilation and fire protection is one of the important economic problems that the Butte operators have to solve. These obstacles are being rapidly overcome, and a large expenditure is being made to this end by the Anaconda and other large companies through the medium of electric-driven Sirocco fans, concrete shafts and station lining, and the moving of power cables from shafts to parallel vertical diamond-drill holes. The Anaconda company is now delivering 1,500,000 cu. ft. of fresh air per minute to its extensive deep underground workings. There are in use 30 large Sirocco fans, varying in capacity up to 130,000 cu. ft. These are supplemented underground by 500 smaller machines. This company has given orders for more than $1,000,000 worth of new fans and motors of latest design to meet local conditions. In the design the company's mechanical department has effectively participated. It is evident from the great volumes of fresh air now being delivered at depths ranging down to 3600 ft. vertically and exhausted again through upcast shafts, that with the fuller completion of present plans and the proper utilization of the major installations, underground working conditions will rapidly improve, and the remarkably persistent orebodies of the Butte district, from a ventilating standpoint, may be followed to still greater depth.

Great Falls.—The new ferro-manganese plant of the Anaconda company was to start on September 17. A. E. Wiggin and E. S. Bardwell are in charge. One of the five furnaces is ready, while the remainder were expected to commence work on November 1. The total capacity is 90 tons per day. According to the Butte 'Miner', each furnace is 22 by 10 by 8 ft. inside measurement. Each has six electrodes, placed in pairs. Current is stepped down from 100,000 to 85 or 100 volts for use in the furnaces, the total consumption being 20,000 hp. A charge will consist of 500 lb. of manganese ore, 20 lb. of iron ore, 170 lb. of coal, and 70 lb. of limestone. Manganese from Butte is to be used. Eighty-five men will be employed.

NEVADA

Rochester.—The Rochester Mines Co. pays 2c. per share on October 1. This amounts to $45,000, and is the second of like amount paid this year.

OKLAHOMA

Picher.—Production of the districts last week was 5980 tons of blende and 1071 tons of lead, valued at $441,100.

OREGON

Baker.—Gold mines in Baker county are very short of men. This region produces 90% of the State's gold yield, and includes such properties as the Cornucopia, Powder River, and Rainbow.

UTAH

Alta.—The new aerial tram at the Sells mine is working. Its daily capacity is from 50 to 100 tons of lead-silver ore. More miners are wanted.

Bingham.—Utah Consolidated pays 25c. per share on September 30. This makes $1.25 for 1918, and $42.20 to date.

Park City.—The Judge M. & S. Co. pays 12½c. per share on October 1. This is equal to $60,000, making $2,250,000 to date.

Tintic.—On September 24 the Tintic Standard pays 8c. per share. This is equal to $94,000, making $105,723 for 1918, and $282,964 to date.

CANADA

British Columbia

Anyox.—Owners of the Salmon River and Bush gold mines, at the head of Portland canal, are busy constructing sleigh-roads. This will enable work to be continued in the winter. R. K. Neill of Spokane is in charge.

Sandon.—The Lucky Jim Mines Co. has issued a report covering a period of April 1914 to April 1918. The revenue was $228,161 from ore. The receivers, A. G. Larson, canceled debts amounting to $56,674.

Ontario

Cobalt.—Kerr Lake in August yielded 250,400 oz. of silver.

Nipissing produced 250,737 oz., a decrease of 54,000 oz. when compared with July, and 90,000 oz. less than in June. In August there was treated 98 tons of high and 6890 tons of low-grade ores.

Saskatchewan

The announcement that an immense deposit of potash has been discovered 30 miles north of Maple Creek, near Swift Current, Saskatchewan, has created much interest in British Columbia. Saskatchewan University men have recorded the claims and will retain their control. A branch railway is projected to connect the property with Maple Creek station.

KOREA

Unsan.—The Oriental Consolidated reports that the clean-up in July was worth $111,000. The June output was $143,320, from 25,289 tons of ore. In May, 24,017 tons yielded $134,551, of which $56,996 was profit. The Maibong mill was closed on July 3, the Maibong and Charabowie mines being worked out and abandoned.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

C. W. Purington is at Washington.

Victor Rakowsky is at Santa Barbara.

Robert A. Kinzie has returned from Ely, Nevada.

J. H. Mackenzie has returned from Washington on a short visit home.

T. S. Carnahan spent August in Idaho; he has returned to Bingham.

H. W. Young has returned to San Francisco from Colorado Springs.

D. M. Riordan is at Hanover, New Mexico, in the Santa Rita (or Chino) copper district.

William Fleet Robertson, Provincial Geologist of British Columbia, is on a visit to New York.

Charles S. Taylor is superintendent for the Atolia Mining Co., in San Bernardino county, California.

Louis Webb, until recently manager of the Lagrange mine in Trinity county, California, has gone to New York.

C. F. Kelley, the newly elected president of the Anaconda Copper Mining Co., was here for a few days last week.

Bruce C. Yates, superintendent for the Homestake company, has returned from a vacation in the Yellowstone National Park.

A. H. Rogers, of the firm of Rogers, Mayer & Ball, has recently returned to New York from British Columbia, Colorado, and Missouri.

George H. Hutton, superintendent for the Valdor Dredging Co., at Junction City, California, has resigned to enter the Engineer Corps of the Army.

A. H. Fay, mining engineer and statistician for the U. S. Bureau of Mines, spent two days at Lead, South Dakota, on his return from San Francisco.

R. W. Mackey, assistant foreman, and **L. M. McBride,** engineer to the Homestake company, have been recommended for commissions in the Engineering Corps.

Olaf P. Jenkins, assistant professor of economic geology in the State College of Washington, at Olympia, has been appointed geologist for the Arizona State Bureau of Mines, at Tucson.

Thomas Ewing, mining man and soldier of fortune, died in San Francisco on September 18, at the age of 83. Colonel Ewing was born at Lancaster, Ohio, in 1835. In 1859 he was one of a party to cross the plains to California. The Mother Lode knew him well as a contractor, prospector, and miner. The more difficult and dangerous the job, the better he liked it. He transported bullion from Grass Valley and Nevada City over the old stage-route across the Forest Hill divide. He could handle 20 mules with a jerk-line, a black-snake, and a vocabulary wonderful in its intensity, and scorching in its vitriolic punch. From there to the desert plains of Arizona, New Mexico, and California was his next move. He became an Army contractor and Indian fighter, serving under General Crook with food and supplies along trails infested with Apache Indians. Mining ventures in old Mexico, Arizona, Nevada, California, and Montana followed one another in rapid succession; the money he made in one he lost in the next; and an estate said to have run into the hundred of thousands went in an unfortunate real-estate venture near Seattle, where the collapse of a boom left Colonel Ewing stranded in the early 'nineties. With dauntless spirit so typical of the Westerner, and never sparing himself any physical hardship, he was constantly hatching one scheme after another, until he died of heart failure.

THE METAL MARKET

METAL PRICES

San Francisco, September 24

Aluminum-dust, large and small lots, cents per lb	65—70
Antimony (wholesale), cents per pound	16
Copper, electrolytic, cents per pound, in carload lots	26.00
Copper, electrolytic, cents per pound, in small quantities	27.35
Lead, pig, cents per pound	8.30—8.80
Platinum, Government price, per ounce	$105
Quicksilver, per flask of 75 lb	$120
Spelter, cents per pound	12
Zinc-dust, cents per pound	16

ORE PRICES

September 24

Antimony, 45% metal, f.o.b. California, per unit	$1.10
Chrome, 38 to 48%, California, per unit	$1.25—$1.50
Fluorspar, 85% CaF_2, f.o.b. shipping point, or San Francisco, per ton	$22—$30
Magnesite, crude, California, per ton (nominal price)	$7.00—8.00
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 45%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 85% MoS_2	$1.00
Pyrite, per unit of sulphur, cents	28—32
Tungsten, 60% WO_3, California, per unit	$20—$25

An international agreement for the pooling of all available tungsten among the United States and the Allies, reached through the Inter-Allied Munitions Council at Paris, was announced on September 19 by B. M. Baruch of the War Industries Board. Its terms will be made public if the arrangement is finally approved by President Wilson.

EASTERN METAL MARKET

(By wire from New York)

September 24.—Copper is unchanged, likewise lead. Spelter is quiet and easier.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.35c., respectively, until August 15. On August 7 the current rates were again fixed until November 1, prices to be effective on the day of shipment, not the day of sale.

Copper outputs of some of the large mines in August were as under:

Mine	Pounds	Mine	Pounds
Calumet & Hecla and 8 subsidiaries	10,718,520	Nevada Con	6,500,000
Chino	5,065,818	Old Dominion	2,064,000
Magma	900,000	Ray Con.	6,625,000
Mason Valley	1,245,000	Utah Copper	19,920,947
		Wolverine	334,547

C. & H., Chino, Old Dominion, and Ray reported decreases, while Utah was 3,900,000 lb. ahead of July.

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government has fixed its maximum at 48.81 pence for metal 925 fine.

Silver export licenses granted by the Federal Reserve Board show that from September 1917 to May 24, 1918, metal worth $155,237,725 had been sent to the Orient; while from May 24 to August 23, 1918, licenses totaled $105,290,285. The Board says that applications for the exportation of silver were increasing, and that the amounts licensed for exportation would grow greater as the difficulty of obtaining gold or securing exchange at satisfactory rates increased.

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. This is to be continued until January 1, 1919, the price at point of delivery to be at East St. Louis plus freight. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

Lead ore (80% metal) is firm at $100 per ton at Joplin. Premium ore realizes $104.50.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefor $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds.

Eastern Metal Market

New York, September 18.

The metal markets now under complete control and ruled by maximum prices, are copper, lead, and aluminum. All the markets are comparatively quiet, with a firm tone.

There are no changes in copper prices or fundamental conditions.

The tin market is a little stronger, but still inactive.

Lead is under complete control, and still extremely scarce.

Zinc is firm and strong, with sellers disinclined to offer. The tendency is upward.

Antimony is quiet and steady.

In the steel market there continues the cry for more steel, but there is little encouragement to the pleas for higher prices, though some makers of pig-iron and finished steel claim that in the last quarter their costs will be higher than present fixed prices. The August output of steel ingots is estimated at 3,498,000 tons for 27 working days, against 3,532,600 tons for 26 days in July, revealing a greater decline last month in the output of steel than of pig-iron. Interest centres in the meeting at Washington tomorrow, September 19, instead of today, between steel and iron makers and the War Industries Board regarding maximum prices effective after October 1.

A conference is being held in Washington today to consider the price of domestic manganese ore, which is to depend on the amount to be imported from Brazil. If these imports are to be reduced, higher prices for domestic ores and for ferro-manganese will be advocated.

COPPER

Labor conditions and the new draft seem to be the principal topics of discussion. That there is alarm as to the future output of copper, owing to the possible lack of labor or its inefficiency, is beyond doubt. It is understood that there will be a concerted effort by producers and refiners to have their employees listed in the deferred classes. There seem to be ample supplies of copper at present, but the future does not look so bright, and it is to guard against further reductions that efforts now are being directed. There has been a declining tendency in mine output, and also a surprising drop in refinery output in August. The hot weather may have accounted for some of this. There have been heavy decreases in copper imports in June, July, and August, but this is not regarded as serious, because the stocks of crude copper at refineries are ample. Sales and distribution of the metal continue under the control of the Copper Producers' Committee, which seems to be giving satisfaction under difficult conditions. The price of 26c. per lb. is to continue until November 1, with that for less than 5-ton lots at 27.35c. per pound.

TIN

Brief allusion was made in last week's letter to the unconfirmed report that an Allied Executive Tin Committee had been formed to sit in London, composed of representatives of several nations, and that it would control the purchases and distribution of tin for the Allies. Late last week what is understood to have been an official confirmation of this was given out at Washington. Aside from this nothing definite is known here. Importers and dealers are completely at sea as to what has been done or as to what is to happen. They do not know whether their business has been done away with or not. Either such parties in this country will continue to act as a go-between in all transactions subject to the new control, or there will be no use for them at all. The situation is unsatisfactory in its complete uncertainty. There is an impression that too much secrecy is being practised for the good of the market. The market in the past week has been a little more active. Considerable inquiry has developed in the last few days for delivery this year, but it was met by few sellers. This was owing to the lack of tin, and not to any lack of desire to sell. But little business was done. A decided absence of interest is noted in the future-shipment market, but offerings here also have been few. Spot tin is now quoted nominal at 78.50c., New York, with little offering. This price is slightly higher than the low mark of the week at 77c. on September 11. Arrivals of tin at Pacific ports so far this month have been reported as 1320 tons, with 1315 tons arrived at Atlantic ports. The London market has undergone little change, the quotation for spot Straits having been £344 per ton yesterday, against £343 10s. a week ago.

LEAD

The War Industries Board has asked the Lead Producers' Committee to take upon itself officially the entire management of the lead industry, analagous to the duties of the Copper Producers' Committee. The principal difference exists in the fact that the Lead Committee is to attend to all sales, the producers having put their supplies at the disposal of this committee for sale. The situation otherwise is unchanged, with lead as scarce as ever. There is anxiety as to the labor supply to keep production to the maximum, and it is hoped that the new draft will not seriously interfere with this industry. Prices are held by agreement at 7.75c., St. Louis, or 8.05c., New York, with less than carload lots at 8.55c. per lb. When less than one ton is involved, the price may be no more than 8.80c. per lb., New York, or 0.75c. over the base price. Retail dealers are to be strictly held to these rules.

ZINC

The firmness noted last week continues with prices nominally higher. There is not much inquiry from sources outside of the Government itself, and the market is inactive. Producers are well sold up for September and October, and are content to offer little if any metal. There appears to be a distinct scarcity of prompt and September prime Western zinc, for which the quotation is firm at 9.50c., St. Louis. The freight rate now being 35c. per lb. from St. Louis to New York, quotations based at New York should read 35 points above the St. Louis base price. The New York quotation is therefore now 9.85c. for September-October delivery. For last quarter the quotation is firm at 9.20c., St. Louis, or 9.55c., New York. The 6000 tons of grade D, noted last week as wanted by the Government, is said to have been contracted for; it is for delivery in the last quarter at about 2000 tons per month. Bids are understood to have been asked for today for 1000 tons of Navy C zinc. The weekly Government report of the zinc industry shows the output to have decreased 169 tons and the stocks of all grades to have increased 2591 tons, that in grade D, 1037 tons, having been the largest.

ANTIMONY

The market is quiet at 13.87½ to 14c., New York, duty paid for prompt and early delivery, with demand very light.

ALUMINUM

Government maximum prices control the market for No. 1 virgin metal, 98 to 99% pure, and for scrap at 33c. per lb. for 50-ton lots, at 33.10c. per lb. for 15 to 50-ton lots and at 33.20c. per lb. for 1 to 15-ton lots.

Note: Companies not included in the above list are requested to submit details. Changes in capitalization and new dividends will be entered on receipt of the information. This table will be published quarterly.

Production of Zinc Ore

The following table, prepared by C. E. Siebenthal, of the U. S. Geological Survey, shows the sources and output of zinc ore during 1917:

Compared with 1916, last year shows a gain of 8777 tons of recoverable zinc, equal to 1.3%. Decreases of 58,000 tons in Missouri, Montana, Colorado, and Nevada, were offset by an increase of 57,081 tons in Oklahoma.

Arkansas did not keep up its expected output, but only dropped 124 tons. California fell off 2192 tons, Idaho 3326 tons, and Utah 4143 tons. Kansas gained 7801 tons. New Jersey (the New Jersey Zinc Co.) increased from 110,698 to 119,731 tons, equal to 8%. Tennessee continues to enlarge its production, the 28,498 tons being 2070 tons better than in 1916.

Districts producing more than 1000 short tons of recoverable zinc in 1917. (Subject to revision).

District	State	Crude zinc-bearing ore sold or treated	Shipping ore and concentrates: Total quantity	Sulphides: Quantity	Sulphides: Recoverable zinc content	Carbonates and silicates: Quantity	Carbonates and silicates: Recoverable zinc content	Total recoverable zinc content	Percentage of total production

INFORMATION FURNISHED BY MANUFACTURERS

JACKSON ROTARY COMPRESSORS

For several years past, H. O. Jackson, founder of the Jackson Compressor Co., with a staff of engineers has been developing and perfecting a type of compressor for which numerous features are claimed making for a simpler and more efficient compressor-performance. The Jackson rotary compressor, which is a patented device, by reason of its rotary feature, makes a saving of 75% in weight and in floor-space over other designs of compressor and effects a reduction in power. One of the features of the Jackson is that it is without valves, and hence it is devoid of all valve-trouble. The oiling-system is of the circulating type, which

JACKSON ROTARY AIR-COMPRESSOR

ensures ample lubrication with a minimum loss of oil. There is one oil-tank and one valve that controls the feed of the oil into both the compressor and bearings. All of the compressor bearings are of the best grade ball and Hyatt-roller design. The simplicity of construction is one of the outstanding features of the design, there being only five moving parts necessary to compress the air and about the same number of parts in the cylinder and base. The rotary motion, with its well-balanced even torque, makes for a high driving-efficiency, with practically no transmission-loss in power. The light weight makes heavy cumbersome foundations unnecessary. The machine is absolutely noiseless, and the power-requirement has been materially reduced. Jackson rotary compressors are built in sizes to meet the requirements of mine and mill-operation. They are adapted to either belt or direct drive and are also made as direct-connected gasoline-engine compressor-units. All machines are thoroughly tested before leaving the factory, and are guaranteed for one year against defects in material and workmanship. The new plant of the Jackson Compressor Co., the first unit of which is complete and in operation, is of the most improved type of construction. This first building, which is 122 by 225 ft., is fitted with underground concrete conduits for wiring to the various machines, all of which have an individual drive. The power-plant has automatic stoking and coal-handling equipment. Every detail has been designed for efficiency in manufacture and comfortable working conditions for employees. When the plant is completed it will cover the block bounded by Cherokee street, Alameda avenue, Cedar avenue, and the Santa Fe tracks, Denver, Colorado.

COMMERCIAL PARAGRAPHS

The Pocahontas Manganese Corporation, operating properties at Graham, Virginia, has increased its capital from $25,000 to $100,000 for extensions to plant.

The Michigan Smelting & Refining Co., Hamtramck, Michigan, has had plans prepared for the erection of a new works on Joseph Campau avenue, to cost about $100,000.

The Balbach Smelting & Refining Co., Newark, New Jersey, has filed plans for the construction of a new reverberatory furnace at its works, Avenue R and Doremus avenue.

To add to its present holdings in the vicinity of its works at Franklin, New Jersey, the **New Jersey Zinc Co.,** of New York, has purchased Lake Wawayanda and surrounding districts.

The Air Nitrates Corporation, 360 Madison avenue, New York, will build a new addition to its Elizabethtown, Ohio, works, to cost about $25,000. The plant will be used for the production of materials for the Government.

C. W. Cross has been appointed representative for the sale of the products of the **Chicago Pneumatic Tool Co.** to the railroads, in place of L. C. Sprague, who has been promoted to be district manager of sales at New York.

The Sloss-Sheffield Steel & Iron Co., Birmingham, Alabama, will construct a new battery of coke ovens, of Semet-Solvay type, to cost, with by-product equipment, about $5,000,000. The new plant will consist of a series of 120 coke ovens, with output to be used at the local furnaces of the company. It is planned to have the works ready for operation within 12 months. J. W. McQueen is president.

The Detroit Graphite Co., makers of paint and color, has opened a sales office in Salt Lake City at 406-407 Boston building. P. D. Whatley is in charge of the Salt Lake City office and takes care of the need of our customers in Utah, Montana, and Colorado. Mr. Whatley has been with the Detroit Graphite Co. for many years. He has had long training at the factory and in the field, and is in a position to intelligently discuss paint-requirements for the various surfaces and service-conditions in mining and other departments of industry. This company is also represented in the South-West by George S. Thomson, the well-known manufacturers' representative, with office and warehouse at 104 Leon street, El Paso. Mr. Thomson travels through southern California, Arizona, New Mexico, and Mexico. He is intimately acquainted with the mining trade and its paint requirements. He maintains a warehouse-stock of paint at El Paso for immediate deliveries. The Detroit Graphite Co. manufactures paints for all purposes. Its metal-protective coating, 'Superior Graphite Paint,' is well and favorably known in the West and South-West.

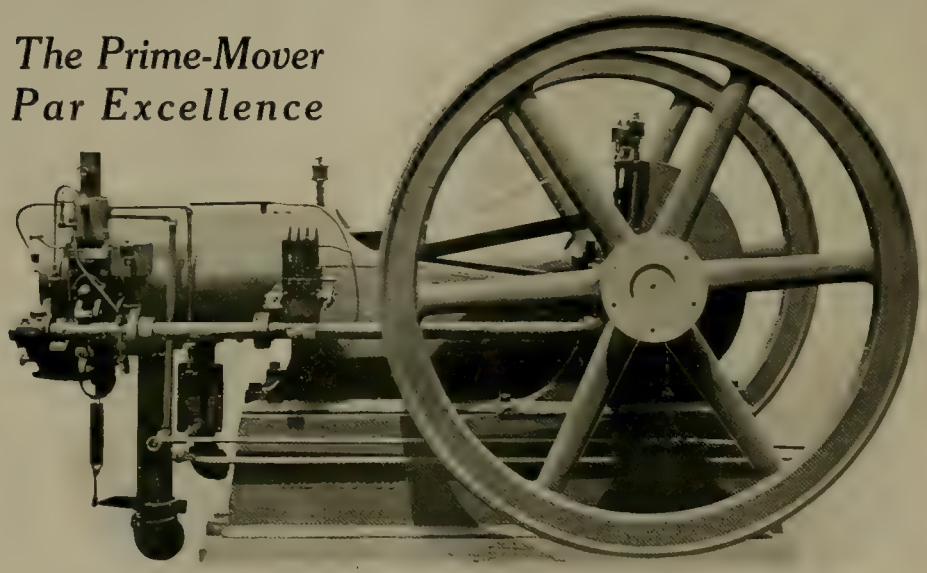
West Coast Engine

The Prime-Mover Par Excellence



The Simplest, Strongest Engine Built

Engines 6 to 120 H. P. **Hoists 6 to 60 H. P.**

The West Coast Engine is a product of 20 years experience. The first engine built is still operating. It is suitable for every power purpose—driving generators, pumps, air-compressors, oil-field and mining machinery.

The West Coast is a low-compression engine. This reduces wear on all moving parts, thus eliminating shut-downs for repairs. The West Coast Patented Oil Spray and Governor System breaks the oil into the finest particles. Perfect combustion, less carbon accumulation and the utilization of every ounce of energy in the fuel oil is the result.

West Coast Engines operate perfectly and are guaranteed to develop full-rated horse-power up to 5000 ft. altitude, using fuel oil, distillate, gasoline, or natural gas.

NOTE—Having the entire field from which to select, the City of Coalinga, California, has just awarded a contract for a 120 h.p., 2 cylinder West Coast Engine for its pumping plant.

Send for descriptive bulletin today.

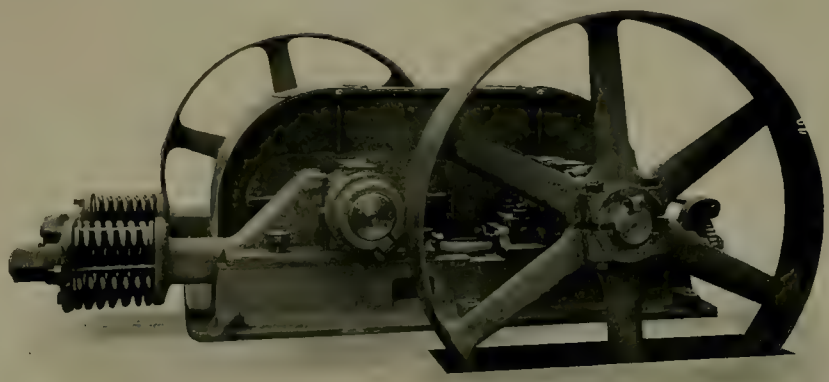
CRUSHING · ROLLS

Design result of fifteen years improvements.
Endorsed by experienced mill men.
Worm gear adjustment for space between shells.
Clamp nuts lock important adjustments.
Ore crushed between Chrome Steel shell faces.



Adjustments made without stopping rolls.
Lateral adjustment of shaft.
Swivel bearings, grit-proof, bronze bushings.
Shafts and centers removed without disturbing spring tension.

BULLETIN No. 1046 gives important data on Roll Crushing

NOTES 437

BANKERS ENDORSE THE GOLD PROPAGANDA.... 438

American Bankers' Association has asked the Government to take action in relief of the gold industry; placed the matter in the hands of the permanent Executive Council; obstacles to Federal action may now be overcome; fallacy in the 'quantity theory' of money as ordinarily stated; analysis of the function of gold in finance. M. & S. P., October 5, 1918.

DOING THEIR BIT 439

American mining engineers in the British military service; cordial relations between England and America; forces raised and losses sustained by the British in the War; contributions of Great Britain in financing the War; comradeship of the English-speaking peoples will guarantee the peace of the world. M. & S. P., October 5, 1918.

MINING LAW 441

International mining law; revision of our mining laws needed; should be considered now in preparation for discussion of international relations of the metal industries; metals vital in Germany's military plans; mines should be owned in fee simple. M. & S. P., October 5, 1918.

ARTICLES

SAVINGS V. SAVAGERY

By Rudyard Kipling 442

Story of the Thugs of India and the Department of Thuggee; the principles of these outlaws did not include murder, rape, and revel in sin for the fun of it; they were superior to the Hun; we must finance this War of protection against the Teutonic destroyer to the last coin in our purse; we must save and not recklessly spend; we must save and give to the Cause of Civilization. M. & S. P., October 5, 1918.

POTASH DEPOSIT IN CHILE..... 444

M. & S. P., October 5, 1918.

THE UTAH COPPER ENTERPRISE—I. HISTORY

By T. A. Rickard..... 445

Discovery of the Great Salt Lake in 1825; coming of the Mormons in 1847; their effort to escape the jurisdiction of the United States; acquisition of the territory from Mexico; policy of the Mormons to prevent development of mining industry; their failure to withstand colonization; silver known to exist in Utah in 1857; influence of Col. P. E. Connor, U. S. A., in developing mineral resources, 1862-'3; discovery of gold in Bingham canyon in 1864; first carload of copper ore shipped in 1868; career of Col. E. A. Wall; exploration of claims that later became the Utah Copper mine. M. & S. P., October 5, 1918.

SIMILARITIES IN THE LEGAL ASPECTS OF THE LITIGATION OVER FLOTATION, CYANIDATION, AND FILTER PATENTS

By R. C. Canby..... 450

Moore filter and Miami flotation cases tried before the same judges; influence of judicial attitude in the first case upon the second; counsel for defendant in Moore case was counsel for M. S. company in the other; comparison of the argument in the two trials; parallel of the flotation and cyanidation cases. M. & S. P., October 5, 1918.

TUNGSTEN-GOLD-COPPER ORE IN KOREA..... 454

M. & S. P., October 5, 1918.

WHY PRICES ARE HIGH

By Richard Hoadley Tingley..... 455

Are prices high because of too much gold, or of an inflated currency? Could buy more and develop business better if things were cheaper; low prices would restrict extravagance; the reason why prices are high is in the demand for labor and materials. M. & S. P., October 5, 1918.

COPPER-LEACHING BY SALT WATER AND SULPHUROUS GASES

By C. S. Vadner 457

In using SO_2 in water for leaching copper ores, red cuproso-cupric sulphite is precipitated; this difficulty overcome by the use of salt; results of tests. M. & S. S., October 5, 1918.

LABOR UNREST IN AUSTRALIA..... 458

REVIEW OF MINING 461
THE MINING SUMMARY 464
PERSONAL 467
THE METAL MARKET 468
EASTERN METAL MARKET 469
INDUSTRIAL PROGRESS 470

Established May 24, 1860, as The Scientific Press; name changed October 20 of the same year to Mining and Scientific Press.

Entered at the San Francisco post-office as second-class matter. Cable address: Pertusola.

Branch Offices—Chicago, 600 Fisher Bdg.; New York, 3514 Woolworth Bdg.; London, 724 Salisbury House, E.C.

Price, 15 cents per copy. Annual subscription, payable in advance; United States and Mexico, $4; Canada, $5; other countries in postal union, 25s. or $6.

There is a big advantage

in these days of freight embargoes for the mine that sends its Supply orders to the nearest Massco office. When you place your next order for

MINING SUPPLIES

give our Denver, El Paso, or Salt Lake City office a trial. They carry in stock mining supplies of all kinds, including:

anvils
asbestos goods
axes
babbitt metals
barrows
belting
belt tools
blacksmith's outfits
blasting materials
blowers
boiler fittings
bolts
ore cars and track
candles
carpenter's tools
cement
chain conveyors
couplings
drills
engineers' tools
files
fittings
gaskets
gauges
grease
grinders
hammers
handles
hangers
hose
jacks
lamps
miners' tools
nuts
oilers
packings
pulleys
punches
pipe
picks
reamers
rivets
rope
safety hooks
saws
scales
scrapers
screens
screws
shafting
shears
solder
stocks and dies
tackle blocks
taps
tongs
tubing
turnbuckles
transmission material of all kinds
valves
vises
washers
water-buckets
wire cloth
wrenches

EDITORIAL

ALL'S WELL on the Potomac, and on the Vardar, also the Jordan, the Dvina, the Meuse, the Suippe, the Ailette, and the Yser. In these days a knowledge of geography gives zest to life.

HUMOR is not lacking in the German reports of military events. "The enemy followed hesitatingly," says Ludendorff. "The English followed us only step by step," says Leman von Sanders. "We are advancing to prepared positions in our rear," says Von Stein. To which we may add that, according to our non-military observation, it seems clear that the Germans are advancing vigorously from the south to the north, and their friends in Bulgaria and Palestine are doing their best to imitate their example.

NO pact is possible with an outlaw; that is the essence of the President's dictum. We cannot come to terms with governments that are without honor. The men that called the Belgian treaty "a scrap of paper" are unrepentant, for did they not lure the poor Russians into a treaty at Brest Litovsk and the Rumanians at Bucharest, and then with cynical effrontery break every obligation into which they had entered, using brute force in complete disregard of their own promises! "No peace by compromise," says the President; we must see this thing through to the end, else we break faith with the dead.

THE demand for cash to balance the outlay required for maintaining our Army in France has not been in evidence because the transactions have consisted in entries on the credit side of the ledger-account with our gallant Ally. The realities of the disbursement and its influence on foreign exchange, however, now begin to appear, when, for the first time in its history, the weekly balance-sheet of the Bank of France carries the name of the United States as a depositor to the extent of $200,000,000. This is the beginning of the visible movement of our money abroad, introducing the novel feature into our foreign relations of the transference of a cash balance for account of Freedom instead of Trade.

PULVERIZED limestone has assumed increasing importance within the last few years as a dressing for acid soils. It adds greatly to the productiveness of the land, and its use has done much toward augmenting the food-supply at this critical moment. Many grinding-plants have been established, and the demand for the product was growing so rapidly as to warrant the erection of additional mills, but development was halted by the impossibility of securing equipment and favorable transportation privileges. These difficulties have now been removed by the action of the War Priorities Board in placing agricultural lime, both raw and burned, in the preferred classification, which includes machinery, fuel, and transportation service. This opens a larger market for crushing and grinding-appliances.

LEST we forget, let us recall the malicious beastliness of the German devastation of French homes, as reported now by our own soldiers: how, for instance, at Chateau Thierry they destroyed the surgical instruments in a doctor's house and defiled the children's toys in other houses. We might overlook the wanton spoiling of works of art and the smashing of furniture, as only more evidence of the barbarian, but we shall not forgive the Huns for their filthy practices and their vicious desecration of all that is beautiful and beneficent. It is reported that two or three houses at Chateau Thierry are to be kept just as they were left by the retreating Germans, as an exhibit of Kultur. It is well; the world must not soon forget what it so barely escaped; the domination of the beast with the brain of an engineer.

ACCORDING to Major George F. Sever, representing the War Industries Board at a joint meeting of engineering societies in San Francisco on September 26, the allocation of power is distributed under three headings: war industries, war essentials, and public utilities. Mining is placed far down in the third class. It is worthy of note that moving pictures and the making of ice-cream are ahead of gold mining. In answer to a question, Major Sever stated that it was just as well to leave the gold in the ground. Mr. H. G. Butler, the so-called Power Administrator, could not explain why electricity was furnished for the benefit of cinemas, saloons, and the pleasure resorts of San Franciscan night-life in preference to the mines of the Mother Lode. The Government has asked employers to recruit labor only through the Labor Bureau, but when the superintendent of the Central Eureka mine, for example, asked for miners and

carmen, he was advised that no assistance could be given and that his order was cancelled. The evident effort to please the voters at the expense of important industry warrants the resentment of those engaged in mining.

THE Transvaal produced 740,210 fine ounces of gold in August, this being 16,418 ounces less than the returns for the same month in 1917. The total output for the first eight months ended August 31 has been 5,732,743 fine ounces, representing a decline of 5.82% from the production in the same period last year, and only 3.77% from the output of 1915. The distance from the great depots of supplies, necessitating the maintenance of large stocks in warehouse, together with the fact that the productive area is a single unit, so that nearly identical conditions govern the whole district, go far toward explaining the relatively small proportion of the decline in the South African in contrast with the rapid decline in the American output. The production in the United States for 1917 was approximately $84,500,000, and for 1915 it was $101,035,700, showing a decrease of 16.33%. This reveals the effect of severe competition in the market for supplies and labor, and the lack of a protective stock of steel and other necessaries to tide over a period of stress. If the War continues another year the exhaustion of stocks and depletion of labor will greatly reduce the output of gold in South Africa, despite the advantage of a large local production of explosives at moderate prices.

IN an English paper we read of the chagrin with which a hundred men employed at a Cornish mine received an unexpected demand for income-tax. Undoubtedly there are thousands of miners in this country that are receiving pay sufficiently large to bring them within the cognizance of the tax-collector, and it is only fair that they should contribute their proper share to the national exchequer during this time of war. It is estimated that nine-tenths of the personal income-taxes collected on account of 1916 came from incomes of more than $25,000 and that labor paid less than one-tenth of 1%—which reminds one of the supposititious critical proportion of oil in the flotation process. Even those having incomes of $5000 and less contributed less than 2% of the grand total of $173,000,000 collected for that year. Evidently capital is bearing a large part of the financial burden that has been laid upon the country, as it should, but it is equally evident that labor should bear its proportion. Those hardest hit are the professional classes and others receiving a nearly fixed income, on whom the abnormal cost of living is falling without alleviation from higher wages or bigger dividends. However, it is this class that is the most intelligent and therefore appreciates best the greatness of the cause for which the whole body of citizens is called upon to make sacrifices, of which taxation is one of the least, for, after all, a man that has to pay a big income-tax is lucky to have the income on which to pay it. Moreover, he has the privilege and opportunity of buying Liberty Bonds—the finest investment that was ever offered.

Bankers Endorse the Gold Propaganda

Now that the American Bankers' Association has requested that the Government take immediate action to maintain the production of gold at its normal pre-war volume, as appears in the resolutions printed elsewhere in this issue, one obstacle that had threatened to impede legislation for relief of the industry has been removed. Amid the overwhelming routine of the enormous business that the commerce of war has entailed, the bankers of the East have scarcely realized the decline in gold production. The statement of the fact in the financial papers could produce but a feeble mental impression compared with the Treasury reports showing our stock of gold rising above the three billion dollar mark and embracing nearly half of all in the possession of mankind outside the people of India and China. Therefore, no interest in the plight of the gold producers had been awakened, nor had the significance of their contribution to the financial strength of the country been appreciated. The bankers, in short, had not thought seriously about the matter; they were either indifferent or disposed to suspect the gold miners of having an eye to undue profits when begging the Government to save them from ruin. Accordingly it is proof that convincing argument was used to persuade the 4000 representative bankers in convention at Chicago to endorse the position taken by the gold producers at recent conferences. The bankers have gone a step further in their declaration that "considering the great importance of this subject this Convention recommends to the Executive Council that the matter be referred to the Federal Legislative Committee and the Currency Commission for exhaustive study, and for such action as may be deemed necessary." Thus it appears that the American Bankers' Association did more than pass perfunctory resolutions, that, in fact, it made the gold propaganda a part of the order of business for its permanent Executive Council. Here is an ally indeed for the gold miner. Economists and financiers among the bankers have not been slow to comprehend the danger that lay in a general decline of the gold industry. The bankers of the Pacific Coast had already taken the initiative at their Gold Conference on September 5. The full report of the proceedings at Chicago has not yet reached us, but we know that Mr. Eugene Davis of Reno, and Messrs. A. L. Mills and E. G. Crawford of Portland, and Mr. John Clausen of San Francisco constituted an effective group in pleading for sustained gold production before the American Bankers' Association. The proceedings at Chicago are symptomatic of what may be achieved at Washington if the case be urged there promptly and energetically. We fear that the gold miners have been somewhat discouraged; efforts have been made to dash their enthusiasm by accounts of objectors to the principle of a bounty, of powerful opponents, and of indifference in the East. These should serve only to arouse our friends to a more determined fight. With the bankers on their side they should start at once upon an intensive campaign at Washington. Delay will make the achieve-

ment more difficult. It is the financiers whose word will determine what relief, if any, shall be given to the producers of gold, and the time to strike is before these men settle back into indifference to the crisis. The spirit of that meeting is in danger of being stifled by the spread of the new financial doctrine that minimizes the importance of gold. This doctrine involves a subtle fallacy, perilous to our financial stability; its influence colors a recent statement by a distinguished governor of a Federal Reserve Bank in which he says, "We have come to understand that the supply of gold is not for the purpose of liquidating bank credits. The former never was nor could it be adequate for that purpose. It is the best measure of value ever discovered and is intended for that purpose, and its chief use is as a guarantee of the soundness of currency based upon it. I am not prepared to say what, in my opinion, if anything, should be done in the way of a subsidy to gold producers, or whether this situation should be left to cure itself, or whether it will cure itself if left to itself. This one thing, however, is certain, we have learned how to make the supply go infinitely further than in former times, and have learned that it is neither necessary nor desirable to use gold itself as currency, but rather as a basis to test the soundness of currency." As a corollary to this we may cite Mr. Irving Fisher, the distinguished economist, who bases his opposition to extending aid to the gold industry on the familiar truism that "an increase in the quantity of gold tends to decrease the value of gold," which is true only when all other conditions remain equal. There are two things that the 'quantity of money' doctrinaires have not faced squarely. One of these is the influence of the degree in which man-power is utilized upon the price-factor as determined by the per-capita circulation; the other is that the consuming power, which grows with the stimulus of productive energy, itself a coincident phenomenon with high prices, necessitates rapid provision of circulating media in adequate quantity to accommodate the size and to facilitate the velocity of trading at a period of high industrial activity. Accordingly credit-money then occupies the breach, and the total exchange accomplished through the credit-system represents, in effect, an expansion of currency enormous as compared with its gold foundation. This is well enough while confidence lasts; it is when a decrease is felt in the demand for commodities or in the opportunity for the profitable development of resources, which had made possible the increase in productive effort with its co-ordinate train of abundant money and high prices, that the balancing of credits and debits in widespread liquidation does in truth "test the soundness of currency." What we have learned during the War is that we have dared to stretch our credit-money to nearly 30 times the volume of the metallic basis. Gold serves not only as a measure of value but as a measure of credit, and we have found that it never had been used to its limit for the second function. Now that we no longer fear the arms of the Hun we are inclined to dream; amid the hopes of social reform the 'market-gauge dollar' theorists are obscuring the sober issues that we may have to face in the days of reconstruction. To appreciate the true importance of gold we must solve the last term of the equation of human necessity; we must open our eyes to a vision of what it would mean to have actual gold rather than mere credit-money in a country that, for a season, had lost its balance, that might be harried by revolution and disorder, such for example as Mexico; we must consider what gold in the vaults would mean today to Austria, torn by the war in which she has sunk to the position of a German vassal, stripped by her Prussian master of the last ounce of gold, so that she possesses nothing wherewith even to pay indemnities or to rehabilitate industry. She can do nothing but submit to effacement and to let the Allies administer the remnants of her empire if she should surrender; her alternative is to fight until she is destroyed with Germany. She is reaping the just reward of her policy, but it is worth while to note the liberty of choice it would give her for swinging from the Teutonic column if her treasury had retained its pre-war stock of gold. A nation's integrity rests upon its financial strength. It was the boast of the bankers at Chicago that we could, if necessary, raise three hundred billions of dollars with which to fight the battles of democracy, and still survive. That was the challenge made in the consciousness of productive power, but beneath it lay the bankers' belief in credits, based in the last analysis upon our ability to liquidate in gold. That is the foundation of political and economic self-determination, and to underwrite that insurance upon our freedom means to uphold the industry of gold mining.

Doing Their Bit

The American mining engineer has been so often engaged in professional work for British companies in other lands, notably South Africa, and he has had such pleasant relations with the other English-speaking members of the profession, that he was in sympathy with the British as against the Germans even before the United States joined the Allies in the fateful struggle that has embroiled the world. Therefore it has been a cause of satisfaction to him to recognize the splendid part played by the 'old country' to which, despite Germanized schoolbooks, the United States owes much of her best blood, her language, her common law, and the ideas of liberty for which Englishmen fought long before a stupid German king and his reactionary ministers caused a political cleavage that in any event was inevitable sooner or later, for the young giant of the West could not have been held in apron-strings to Britannia for long. The Revolution was a family quarrel, between two parties of British, and the Fourth of July celebrates the assertion on this side of the Atlantic of those rights for which the men of our race fought from Magna Charta to the Reformation. Therefore it is timely to correct the insidious attempt of the German propagandists to make it appear that England has been playing a sordid part in the great melodrama, the first scene of which was laid at Sarajevo on June 28, 1914. For instance, it has been said by the pro-

Germans that "Britain will fight to the last Frenchman," as if the British, and the English particularly, were saving their skins at the expense of their Allies. In August 1914 Great Britain's army consisted of 700,000 men, of whom only 250,000 were Regulars, 200,000 were Reserves, and 250,000 were Territorials, or Militia. Since then and up to last March she has raised 7,500,000 fighting men, of whom 5,041,000 enrolled themselves voluntarily. Of the grand total England alone has contributed 60.4%, or 69.5% if the troops from Africa and India are excluded. Great Britain has enlisted in her army and navy one out of every three males. England has given one in 7½ of population; so has Scotland; Wales has given one in 10.2, and Ireland one in 26.3, while the contingents from overseas represent one in 15. The British forces in the field last November showed a big proportion of English, not only in numbers but in casualties, thus:

	Armed forces	Casualties
	%	%
England and Wales	70	76
Scotland	8	10
Ireland	6	6
Overseas Dominions	16	8

In August Mr. Lloyd George stated that the number of men raised for the Army and Navy was 8,500,000, of which 6,250,000 are credited to the United Kingdom, 1,000,000 to the Dominions, and 1,250,000 to India. The last figure suggests the character of a large part of the troops employed in Mesopotamia, Palestine, and Egypt.

When the first slander proved baseless, the German propagandist suggested that the English were letting the Canadians and Australians do all the hard fighting, yet the English casualties since the beginning of the War have been 8.57% more than their proportion, whereas the overseas troops have had casualties proportionately one-half, as shown above. The fact is that the English were so proud of the manner in which their kinsmen hastened to aid the mother country, and so proud of their valor in battle, that they 'featured' them in dispatches from the front and in the accounts telegraphed by newspaper correspondents. So often were the Canadians and Australians mentioned, with enthusiastic praise, that the pro-German had a chance to misrepresent the facts and impose a monstrous lie upon the credulity of the ill-informed. The whole British Commonwealth has spilled its best blood lavishly for the cause of human liberty, as the casualties testify:

From August 1914 to the end of 1915	550,000
In 1916	650,000
In 1917	800,000
In 8 months of 1918	750,000
	2,750,000

This total does not record the wounded that have returned to active service. The sum of all the casualty lists is about 4,000,000. It is reported that the dead number 900,000, and the permanently crippled 600,000. In 1917 the British casualties were 500,000 more than the French. During the week ending September 28, when this is written, the British casualties are stated officially to have been 25,089. During this war the soldiers of England have fought on 15 different fronts, from Flanders to Kiaochau. If the military performance has been so sincere, what shall be said of the service done by the British navy? This: that the War against Germany will have been won primarily by that navy. If the Enemy had not been contained within his borders by the warships of Britain the aid of her own armies could not have been given to France, nor could the American armies have had a chance to deliver the decisive blow. The British Admiralty is reticent, but we do know that the tonnage of the Navy has been increased from 2,500,000 to 8,000,000 in the course of four years. In one month British warships in the aggregate have traveled over a million sea-miles in home-waters alone, while auxiliary vessels in their work of patroling have gone 7,000,000 miles during the same period. The Enemy has been driven off the ocean, and every neutral vessel is subject to inspection. In one month of 1917 not a single vessel trading with neutral countries crossed the Atlantic without being held up and examined. That will have proved an important factor in bringing the War to a victorious conclusion. Of the warships engaged in warfare against the Enemy's submarines in the eastern Atlantic 80% are British; of the miscellaneous patrol craft 86% are British; and of the ocean convoying work 70% is British. Moreover, as against the indiscriminate assassination practised by the German submarines and raiders, the British navy has not caused the loss of a single Neutral life. Great Britain has raised $36,750,000,000 for the War, and of this has loaned eight billion dollars to her Allies and over a billion more to her overseas Dominions. Next March the National Debt will be 40 billion dollars, as against 3¼ billions in August 1914. The excess-profits tax is 80%. It is estimated that the average British business man is contributing three-quarters of his income in various taxes, rates, and subscriptions. The income-tax and excess-profits tax alone aggregate $1,000,000 per hour of every working-day. Our great Ally has spent her money and her blood without stint in a dogged determination to see this thing through. Any suggestion otherwise is of pro-German origin, for it needs no second-sight to discern the truth that most of the effort to make trouble with England comes from the friends of the Enemy. It is time to realize the fact that to asperse an Ally is a subtle form of disloyalty to the Cause, if not to the Nation. Hearst and his yellow press played on that rotten string until it broke. The figures that have been quoted are eloquent in themselves, and we shall probably please our friends across the Atlantic by omitting any panegyric. The best report on the case will come from eye-witnesses, from our own gallant soldier-boys when they return home. We look to a comradeship between the British and American soldiers, aided by a common language, and by other things less palpable, that shall be not only the symbol, but the means, of a friendly understanding, the cornerstone of a Palace of Peace more real than that ironic structure constructed at the Hague. Then will have come true the wish expressed by Thomas Jefferson to James Monroe; the writer of the Declaration of Inde-

pendence stated in a letter to the President with whose name is associated the cardinal principle of American policy thus: "With her [Great Britain] then, we should most sedulously cherish cordial friendship, and nothing would tend more to knit our affections than to be fighting once more, side by side, in the same cause." That day has come, and we thank God for it!

Mining Law

International mining law has been discussed in a luminous manner recently by Mr. Theodore F. Van Wagenen. We publish a review of his interesting and suggestive volume elsewhere in this issue. For many years the revision of our Federal mining statute has been discussed; it has inherent defects that need correction; moreover, the legal status of various mineral deposits has been complicated by subsequent legislation, and confusion has been created by administrative orders in the interest of the Forest service and of those who have interfered with the development of phosphates, salines, petroleum, oil-shales, and other substances. The legal edifice displays lack of unity in design, by reason of the misconceptions of geologic facts in the original statute, the later Acts of Congress affecting specific minerals, Executive Orders, which, by virtue of their quality as decrees, constitute a species of law-making, and the surmounting entablature of judicial decision reared upon these fundamental columns. It may seem an undesirable moment, however, while the best thought of the Nation is concentrated elsewhere, for bringing this subject to the attention of Congress. On the other hand, as suggested by our reviewer, himself an eminent lawyer, the complicated economic policies to be compressed into the treaty that will attempt to establish international peace on a secure foundation after the War can hardly fail to include the conditions under which the mineral wealth of the world is to be distributed for the welfare of mankind. Control of metallic resources was a principal objective of the German plans for war; to secure them she spun a web of banking, smelting, and metal-trading corporations that covered the earth. In its meshes mines and reduction works in every country were caught like unsuspecting flies. Germany failed, however, to appreciate the value of gold mines, which vitalized banking organizations that have been able, by means of the monetary power available for expanding credits, to encourage industry, to gather the fruits of the earth, and to distribute them by the natural mechanism of trade, without resort to the commandeering of labor and supplies. This metallic resource has preserved the commercial and financial structure of the Allies through the stress of war, without sacrificing the freedom and initiative of the democratic peoples now leagued for self-preservation. Germany tried to grip us with tools made from the product of the mine, but she failed to control the one metal from which is developed, like steam from water, the motive power of the industrial mechanism. We see how intimately the peace of the world is related to the development and control of its mineral resources, and how the misuse of the legal privileges affecting them may imperil the safety of nations and the progress of civilization. Problems of this kind are likely to come forward at the council-table; and those best informed will best know how to deal with them. Consideration at this time of the fundamental questions of national and individual rights in minerals will prepare the way for dealing justly and wisely with the proprietary rights in the minerals and the manner in which they may be acquired and held. The democratic spirit is expressed in the accentuation of individual right; reasonable limitation of individual right is in line with a proper regard for the purpose of of democratic government; but the control of mineral wealth as inalienable State property, to be operated under the narrow concessions of leaseholds, is in line with that spirit of social and industrial organization which Germany so readily employed for imperial aggrandizement. We are pleased to note that Mr. Van Wagenen declares for the tenure of mines in fee-simple. We believe that this principle will be extended after the War, for the kind of democracy that then will be cultivated is that which depends upon organized individualists, not upon servile pawns whose will and initiative have been submerged in socialistic bureaucracies. It was Paul Milyoukov who pointed out that the only change to be expected from the rise of so-called democracy in Germany would be the substitution of the "intelligent absolutism" of the people in place of the military autocrat. This points a moral, though we dissent from the application of the word 'intelligent', because we do not believe that intelligence develops under collectivism. The one great universal stimulus to intelligence, in man and brute, is, and always has been, peril; it is the reaction for self-protection. We believe that virile individualism will increase the glory and right growth of America, England, and every other country. One of the essentials to individualism is the absolute right and legal recognition of ownership in property. The system of concessions has flourished widely; those that argue from precedent have the advantage there; nevertheless the principle is unsound, and will be out of harmony with the new democratic spirit. The tendency to introduce concessions for titles has grown too far already. Even in time of war, the subject deserves consideration, because we need to appreciate the interest of all nations in each nation's mineral resources and the conditions affecting economic exploitation. Our system of holding mining claims without performing a proper amount of development work has been criticized justly and has been used as an argument in favor of the leasehold, but the desired end, which is the discovery of mineral resources and the production of metals for the good of the people, can be served better through requiring the claim-owner to complete his title, by proceeding to patent, within a limited period. This is but a single example, yet it touches the vital point in what most concerns the world in its consideration of mineral deposits, namely utilization.

Savings v. Savagery

A Story

*If you will allow me, I will tell you a story. Once upon a time, a hundred years ago, there was a large and highly organized community in India who lived by assassination and robbery. They were educated to it from their infancy; they followed it as a profession, and it was also their religion. They were called Thugs. Their method was to disguise themselves as pilgrims, or travelers, or merchants, and to join with parties of pilgrims, travelers, and merchants moving about India. They got into the confidence of their victims, found out what they had on them, and in due time—after weeks or months of acquaintance—they killed them by giving them poisoned foods—sweetmeats for choice—or by strangling them from behind as they sat over the fire of an evening, with a knotted towel or a specially prepared piece of rope. They then stripped the corpse of all valuables, threw it down a well or buried it, and went on to the next job.

At last things got so bad that the Government of India had to interfere. Like all Governments, it created a Department—the Department of Thuggee—to deal with the situation. Unlike most Departments, this Department worked well, and after many years of tracking down and hanging up the actual murderers, and imprisoning their spies and confederates, who included all ranks of society, it put an end to the whole business of Thuggee.

The world has progressed since that day. By present standards of crime those Thugs were ineffective amateurs. They did not mutilate or defile the bodies of the dead; they did not torture, or rape, or enslave people; they did not kill children for fun, and they did not burn villages. They merely killed and robbed in an unobtrusive way as a matter of education, duty, and religion, under the patronage of their goddess, Kali the Destroyer. Very good.

German International Thuggee

At the present moment all the Powers of the world that have not been bullied or bribed to keep out of it have been forced to join in one International Department to make an end of German international Thuggee, for the reason that if it is not ended life on this planet becomes insupportable for human beings. Even now there are people in England who find it hard to realize that the Hun has been educated by the State from his birth to look upon assassination and robbery, embellished with every treachery and abomination that the mind of man can laboriously think out, as a perfectly legitimate means to the national ends of his country. He is not shocked by these things. He has been taught that it is his business to perform them, his duty to support them, and his religion to justify them. They are, and for a long time past they have been, as legitimate in his eyes as the ballot in ours. This, remember, was as true of the Germans in 1914 as it is now.

People who have been brought up to make organized evil in every form their supreme good, because they believe that evil will pay them, are not going to change their belief till it is proved that evil does *not* pay. So far, the Hun believes that evil *has* paid him in the past, and will pay him better in the future. He has had a good start. Like the Thug, the Hun knew exactly what he meant to do before he opened his campaign against mankind. As we have proof now, his poisoned sweetmeats and knotted towels were prepared years beforehand, and his spies had given him the fullest information about all the people he intended to attack. So he is doing what is right in his own eyes. He thought out the hell he wished to create; he built it up seriously and scientifically with his best hands and brains; he breathed into it his own spirit that it might grow with his needs; and at the hour that he judged best he let it loose on a world that till then had believed there were limits beyond which men born of women dared not sin.

When the Veil is Lifted

Nine-tenths of the atrocities Germany has committed have not been made public. I think this a mistake. But one gets hints of them here and there—Folkestone has had more than a hint. For instance, we were told the other day that more than 14,000 English non-combatants—men, women, and children—had been drowned, burned, or blown to pieces since the war began. But we have no conception—and till the veil is lifted after the War we shall have no conception—of the range and system of these atrocities. Least of all shall we realize, as they realize in Belgium and occupied France just across the water, the cold organized miseries which Germany has laid upon the populations that have fallen into her hands, that she might break their bodies and defile their souls. That is part of the German creed. What understanding is possible with a breed that has worked for and brought about these things? And so long as the Germans are left with any excuse for think-

*A speech delivered at Folkestone, England, on February 15, 1918.

ing that such things pay, can any peace be made with them in which men can trust? None. For it is the peculiar essence of German kultur, which is the German religion, that it is Germany's moral duty to break every tie, every restriction, that binds man to fellow-man, if she thinks it will pay. Therefore all mankind is against her. Therefore all mankind must be against her till she learns that no race can make its way or break its way outside the borders of humanity.

A Hell Without Hope

The more we have suffered in this War the more clearly do we see this necessity. Our hearts, our reason, every instinct in us that lifts us above the mere brute, shows us that the War must go on. Otherwise earth becomes a hell without hope. The men, the ships, the munitions must go forward to the War, and behind them must come the money, without which nothing can move. Where our hearts are there must our treasure be also.

There has been a great deal of money spent in England lately, several millions a day for the last twelve hundred days. That means that many people have had the chance of earning more money—in some cases very much more money—than they could have earned in peace time. But all the money in the world is no use to a man or his country if he spends it as fast as he gets it. All he has left is his bills and the reputation of being a fool, which he can get much more cheaply in other ways. There's nothing fine or funny in throwing away cash on things you don't want merely because the cash is there. We've all done it in our time and we've all had to pay for it. The man who says he never worries about money is the man who has to worry about it most in the long run, and goodness knows there's enough worry in the world already without our going out of our way to add to it. Just now we all have the opportunity of protecting ourselves against private and public anxieties by investing as much as ever we can in War Loans.

Money Sits up all Through the Year

Money is a curious article. Have you ever thought that invested money is the only thing in the world, outside the Army, the Navy, and the Mercantile Marine, that will work for you while you sleep? Everything else knocks off, or goes to bed, or takes a holiday at intervals, but our money sits up all through the year, working to fetch in the 5% interest that the Government gives on every pound it borrows from us. I am not a financier, but I do know that much, and I do know that a man who has an income, however small, from money he has saved, is free of worry and anxiety for himself, his wife, and his children, up to the extent of that income. It gives him self-respect, a more even temper, a reason for looking at the future with calm and confidence. A man who has wasted or muddled all his pay at the end of the week is the servant of the whole world for his next week's pay. The man who has his bit in hand is independent of the world as far as that bit goes, and that knowledge at the back of one's head must make life a different affair to every thinking man or woman.

Savings represent much more than their mere money value. They are proof that the saver is worth something in himself. Any fool can waste, any fool can muddle; but it takes something of a man to save, and the more he saves the more of a man does it make him. Waste and extravagance unsettle a man's mind for every crisis; thrift, which means some form of self-restraint and continence, steadies it. And we need steady minds just now.

Remember, too, that everything we waste in the way of manufactured goods, from a match upward, as well as everything we buy that isn't absolutely necessary to get on with, means diverting some man or woman's time and energy from doing work connected with the War. And war work, which means supplies, food, munitions, ships, is the only thing that is of the least importance now. Everything outside that necessity is danger and waste.

So you see we are all in a splendid position to invest. Not only is there more money going about and fewer things to buy with it, but it is also wrong to spend money on what there is available. The road has been cleared of all obstacles to saving. The interest on what we save helps to make us personally independent; the money we lend to the Government helps to set our land and our world free. Our security for our loan is not only the whole of the British Empire, but also the whole of civilization, which has pooled its resources in men, money, and material to carry on this War to victory. Nothing else under heaven matters today except that the War should go on to that end.

The Personal War Aim

From time to time the representatives of the Allies meet together and lay down what the War aims of the Allies are. From time to time our statesmen repeat them. They all agree we are fighting for freedom and liberty, for the right of small States to exist, and for nations to decide for themselves how they are to be governed. All this we understand and perfectly believe. That is the large view of the situation. What is the personal aspect of the case for you and me? We are fighting for our lives, the lives of every man, woman, and child, here and everywhere else. We are fighting that we may not be herded into actual slavery such as the Germans have established by force of their arms in large parts of Europe. We are fighting against eighteen hours a day forced labor under the lash or at the point of the bayonet, with a dog's death and a dog's burial at the end of it. We are fighting that men, women, and children may not be tortured, burned, and mutilated in the public streets, as has happened in this town, and in hundreds of others. And we will go on fighting till the race that has done these things is in no position to continue or repeat the offence.

If for any reason whatever we fall short of victory—and there is no half-way house between victory and defeat—what happens to us? This. Every relation, every understanding, every decency upon which civilization has been so anxiously built up will go—will be

washed out, because it will have been proved unable to endure. The whole idea of Democracy—which at bottom is what the Hun fights against—will be dismissed from men's minds, because it will have been shown incapable of maintaining itself against the Hun. It will die; and it will die discredited, together with every belief and practice that is based on it. The Hun ideal, the Hun root-notions of life, will take its place throughout the world.

If We Fail—

Under that dispensation man will become once more the natural prey, body, and goods, of his better-armed neighbor. Women will be the mere instrument for continuing the breed: the vessel of man's lust and man's cruelty; and labor will become a thing to be knocked on the head if it dares to give trouble, and worked to death if it does not. And from this order of life there will be no appeal, no possibility of any escape.

This is what the Hun means when he says he intends to impose German kultur—which is the German religion—upon the world. This is precisely what the world has banded itself together to resist. It will take every ounce in us; it will try us out to the naked soul. Our trial will not be made less by the earnest advice and suggestions that we should accept some sort of compromise, which means defeat, put forward by Hun agents and confederates among us. They are busy in that direction already. But be sure of this: Nothing—nothing we may have to endure now will weigh one featherweight compared with what we shall most certainly have to suffer if for any cause we fail of victory.

Potash Deposit in Chile

*In the province of Tarapacá in northern Chile exists a deposit of salts containing large amounts of potash. This is known as the Salar de Pintadas, constituting a portion of the Pampa del Tamarugal, at an elevation of 3200 ft. above the sea. The area of the saline is approximately 1300 acres. The western boundary is formed by the Coast Range, which at this point consists of high escarpments. On the west it merges into the more elevated parts of the Pampa. Toward the south the saline is broken into a series of basins extending to the salar of Bellavista. The surface is covered by a hard crust of clay and earth mixed with salts of chloride of potassium and sulphate of sodium. The thickness of the crust varies from two to three feet. Below this is a deposit of crystalline white salt, about one foot thick, followed downward by six to eight inches of sand, containing small amounts of salt. Below that is a deposit of wet clay. This section is characteristic of the entire deposit. The argillaceous material in the crust represents wind-borne dust, which is caught by the moisture present in the basin. The distribution of the potash has been remarkably uniform. The crust contains as a rule from 2 to 3% of potassium chloride, although at many points the proportion rises to 10%. The white crystalline salts below the crust are usually richer, 10 to 15% being not uncommon, and rarely falling as low as 4%. Analyses by Enrique Taulis of the School of Agriculture at Santiago, give the following average:

	%
Moisture (at 110° C.)	5.000
Insoluble	1.324
Chlorine	37.861
Sulphuric anhydride	15.334
Lime (in terms of calcium)	0.272
Carbon di-oxide	0.134
Sodium	29.533
Potassium	7.409
Magnesium	trace
Oxygen (calculated to sulphates)	3.066

Reducing this to the corresponding salts present, and comparing the result with the analysis of the carnallite deposits in Germany, the deposit shows some advantages in composition, as seen in the following table:

	German Carnallite %	Chilean Salar de Pintadas %
Potassium chloride	15.5	14.15
Magnesium sulphate	12.1	....
Magnesium chloride	21.5	....
Sodium chloride	22.4	51.45
Calcium sulphate	1.9	0.93
Sodium sulphate	...	28.29
Insoluble	0.5	1.32
Moisture	26.1	5.00

The absence of the salts of magnesium, which are extremely soluble, removes one great difficulty in the purification of the Chilean product, since potassium chloride is relatively insoluble in water between the temperatures of 20° and 32° C., while the sulphate of soda is highly soluble at those temperatures. It is therefore possible to dissolve out the sodium sulphate with but little loss of the KCl in the waste liquors. A recent investigation of this Chilean deposit of potash salt indicates a total quantity of 1,813,833 tons available for treatment, divided into the following grades: Salts containing 3% KCl 138,956 tons, 6% 818,797, 9% 709,513, 12% 173,826, over 12% 72,741 tons. The salts represent a concentration, in the lower basin of the Pampa del Tamarugal, of waters seeping through, and originating in the adjacent high Cordillera of the Andes. The source of the potash is in the great masses of liparite, which contain from 3 to 8% of K_2O. The region is absolutely rainless, so that it is impossible that the salts could have been brought in from the sea, and the constant humidity of the layer of sandy clay proves that the subterranean water reaches the crust by capillarity, where it deposits the salts on evaporation. Although the Pampa is dry, and receives no precipitation, there are almost daily storms in the high Cordillera from late December to March, in which the rainfall is heavy. At this period the low basins of the valley fill with water, and at times inundate large areas of the pampas. Accordingly there is an inclined water-table, or probably wide channels under the pampas, leading from the main drainage lines in the Andes, and these waters carry the salts dissolved from the decomposing potash-bearing liparite. Samples of water from wells sunk along drainage-lines that feed the saline have showed on analysis from 0.191 to 0.750 gm. of K_2O per litre.

A MALLET COMPOUND LOCOMOTIVE, ON THE BINGHAM & GARFIELD RAILROAD, HAULING 50 CARS (3500 TONS) OF UTAH COPPER ORE

The Utah Copper Enterprise—I

History

By T. A. RICKARD

The Great Salt Lake was discovered in 1825 by James Bridger, a fur-hunter, while seeking the source of the Bear river. He tasted the brackish water of the inland sea and wondered if it were an arm of the Pacific ocean. The lake was first seen by the Mormons on July 24, 1847. A band of them, numbering 145 and led by Brigham Young, had migrated from Missouri in search of a new home. It is recorded that when Brigham Young stood on the summit of the pass over the Wasatch range and saw the valley of the Jordan outspread before him, he exclaimed: "It is enough; this is the right place." He had seen it in a vision, he claimed, and foresaw the future glory of the new Zion that was to be planted in that happy valley. The proper name of the Mormons is the Church of Jesus Christ of Latter-day Saints, a name adopted by them in 1834 while they were established in Missouri. This sect was founded by Joseph Smith, Jr., at Manchester, New York, in 1830, in consequence of a vision in which the Book of Mormon, in golden tablets, was revealed to him by the angel Maroni, the son of Mormon, both of these, it is alleged, having survived a fierce war waged between groups of Hebrew settlers that came to America from Jerusalem viâ Chile. At one time the word Mormon was supposed to represent the English transliteration of the Greek word *mormoo*, but Joseph Smith denied this derivation, and said that it came from the Egyptian *mon*, meaning good, and the English word 'more', abbreviated to 'mor', so that it meant literally 'more good'! By the end of 1848 the Salt Lake settlement had a population of 5000.

The Mormons thought to escape the jurisdiction of the United States government, but they were thwarted by the treaty of Guadalupe Hidalgo, signed on February 2, 1848, at the close of the Mexican war. By this treaty Mexico ceded an immense stretch of Western territory to the United States, including the region over which Brigham Young and his followers had but lately established control. Early in 1849 the Mormon community was organized as the State of Deseret, with Young as Governor. According to the Book of Mormon the word 'Deseret' means "land of the working bee"—a good symbol for this industrious people and one that is perpetuated by the beehive that now appears on the seal of the State of Utah. Deseret comprised not only the Utah of today but also Arizona, Nevada, and parts of New Mexico, Colorado, Wyoming, and California. Brigham Young claimed a sway imperial in its perspective. In 1850 Deseret was admitted into the United States as the Territory of Utah; it had shrunk in area, but still included portions of New Mexico, Colorado, and Wyoming

On January 4, 1896, the present State of Utah was organized and admitted into the Union. The word Utah is a corruption of Ute, a Shoshone Indian tribe. I shall end these references to the early days of the City of the Saints by quoting a description of the Salt Lake valley as it appeared to the famous traveler Sir Richard Burton on August 25, 1860, when he stood in Emigrant Gap, or 'Emigration Kanyon,' as he called it. Burton wrote in his diary[1] thus:

"The sun, whose slanting rays shone full in our eyes, was setting in a flood of heavenly light behind the bold jagged outline of Antelope Island, which, though distant twenty miles to the north-west, hardly appeared to be ten. At its feet, and then bounding the far horizon, lay, like a band of burnished silver, the Great Salt Lake, that still innocent Dead Sea. South-westward also, and equally deceptive as regards distance, rose the boundary of the valley plain, the Oquirrh Range, sharply silhouetted by a sweep of sunshine over its summits, against the depths of an evening sky, in that direction so pure, so clear, that vision, one might fancy, could penetrate behind the curtain into regions beyond the confines of man's ken. In the brilliant reflected light, which softened off into a glow of delicate pink, we could distinguish the lines of Brigham's, Coon's, and other kanyons, which water has traced through the wooded flanks of the Oquirrh down to the shadows already purpling the misty benches at their base." Since then many shadows have crossed the range, but the sunsets retain the same qualities of beauty, and the clear ether still provokes the imagination of man. Sir Richard spells 'canyon' in his own way and undoubtedly was misled by false analogy to speak of "Brigham's", instead of Bingham, canyon. He was exhilirated by the fresh mountain air, in common with every traveler, so that it seemed to him "Switzerland and Italy lay side by side." To him the Salt Lake valley, "this lovely panorama of green, and azure, and gold—this land, fresh as it were, from the hands of God," was worthy to be the Zion of the Latter-day Saints and even of later sinners.

The discovery and development of mineral deposits in the Bingham district, like that of the territory of Utah as a whole, was retarded by the opposition of the Mormons, who intended to make agriculture the basis of their development and therefore discouraged the search for minerals. "This opposition", as S. F. Emmons has said, "and the natural obstacles in the way of cheap mining, or of an economic reduction of the generally rather refractory ores, acted as an effectual bar to the development or even the discovery of the mineral resources of the Territory in its early days."[2] The transcontinental migration that followed the discovery of gold in California did not lead to any important find of ore in this region, because the leaders of the Mormon church were successful in preventing it, "fearing that the excitement and unsettling influence of mining would turn away their people from the more monotonous and peaceful occupations of agriculture and thereby interfere with their great work of reclaiming the desert, and fearing, also, that the restless and sometimes rather lawless class of people who are attracted by mining excitements might prove a disturbing element in the population and tend to subvert their almost autocratic authority."[3] Orson F. Whitney, a Mormon bishop, in his history of Utah, exclaims: "Who wished to see Deseret, peaceful Deseret, the home of a people who had fled for religious freedom and quiet to these mountain solitudes, converted into a rollicking, roaring mining camp? Not the Latter-day Saints!"

The logic of events proved too strong for the Mormons in Utah as it proved too strong also for the Boers in the Transvaal. Indeed, the analogy is not sufficiently appreciated. The Boers left the Cape Colony in order to escape from British control; they believed in the practice of slavery, quoting biblical authority therefor; and they wanted to have ample room for their pastoral industry. So they crossed the Vaal. The Mormons, desiring to escape from the legal control of established American communities, believing in the practice of polygamy, for which likewise they quoted the biblical text, and, hoping to develop a purely agricultural industry in an isolated region, migrated into the western wilderness and settled in the valley of the Jordan on the shores of the Great Salt Lake. Boer and Mormon* alike expected to remain detached from the civilization they had abandoned, each expected to establish his own way of living in the outer wilderness, each was disappointed and thwarted by the oncoming tide of industrial progress. The pioneers of mining, in their eager search for mineral wealth, invaded the Transvaal and Utah, at first peaceably and then aggressively, establishing themselves assertively as their numbers increased, until the long arm of modern progress, which neither Boer nor Mormon could defy, reached forth into the new communities and claimed suzerainty. Slavery was as repugnant to the Briton as polygamy was repugnant to the American. The maintenance of these practices undermined the status of the Boers and Mormons, respectively; it created a prejudice under cover of which the invading prospector was enabled to obtain protection, ending in the submersion of the political islands that the Boer and the Mormon alike had tried to create in the midst of a continent.

So Brigham Young failed to realize his purpose of establishing a separate people, but he succeeded, beyond his dreams, in laying the foundations of a thriving community on the shore of the great lake. Any disparagement of the Mormons on account of their opposition to mining or on the score of their polygamous practices must be coupled with a hearty admiration for their energy as pioneers and with high praise of their thrifty enterprise. To this day they set a good example to the

[3] Ibid. Op. cit.

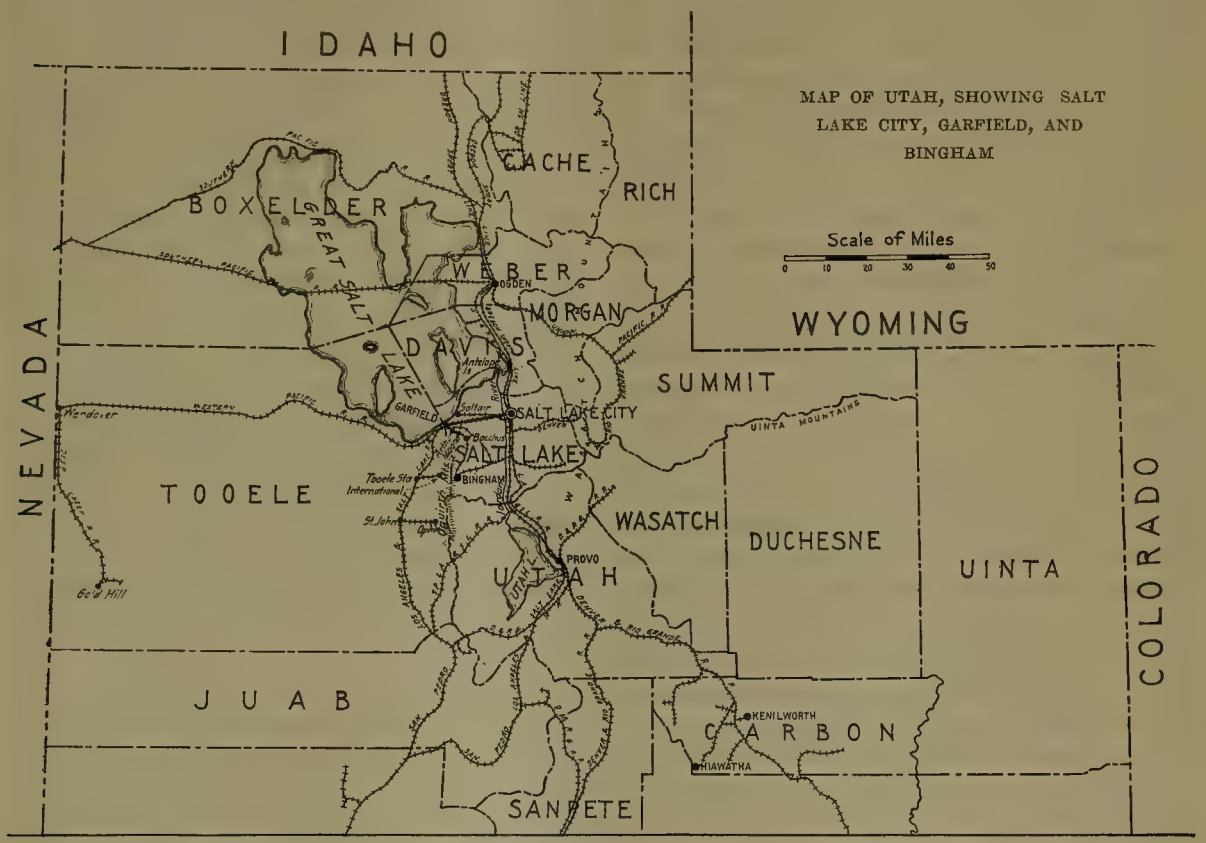
*It is worthy of note that the Mormon settlement included a large proportion of British.

people of the West by their intensive farming, collective loyalty, and intelligent co-operation.

The existence of silver ore near the Great Salt Lake became known in 1857, but Mormon influence prevented the development of mines. In 1862, during the Civil War, the Third California Infantry happened to become stationed at Fort Douglas, overlooking Salt Lake City. Many of the soldiers in this volunteer regiment had seen something of gold mining in California; their commander was Colonel Patrick E. Connor, who, it is said, looked to immigration to settle the Mormon question, then becoming acute. He encouraged prospecting and granted furlough to his men so that they had frequent opportunity for exploring the neighboring mountains, when not required to prevent depredations by the Indians—Piutes and Goshutes—and to keep an eye on the Mormons, who were unfriendly. Bancroft says:[4] "The first systematic efforts at prospecting, made by permission of General Connor,[5] when in command at Fort Douglas, were ridiculed in the Tabernacle, and later, when mining projects were brought forward by Gentiles, they were steadily discountenanced." Whitney says[6] of Connor: "His object was to reconstruct Utah, to put the Mormons under and render the Gentiles paramount. To effect that object he strained every effort of his energetic soul; hesitating not to grossly exaggerate, not only the growth of the infant industry of mining, making it appear a very giant at its birth, when everyone knows that for years it was a mere babe in arms, never attaining to any proportions until after the advent of the railway, but also the general condition of affairs at Salt Lake City and throughout the Territory."

At that time the Bingham district was known to the Mormons for its fine timber, red pine three feet in diameter being common. Early in the autumn of 1863 an apostate Mormon, George B. Ogilvie, found fragments of lead ore in the canyon and took them to Fort Douglas, where they were exhibited to General Connor. On September 17, 1863, the discovery was located as the 'West Jordan' claim, which was the first mining location made in Utah. In the following December a mining district, the first in the Territory, was organized under the name of West Mountain, which is the English for the Indian word Oquirrh. It included the whole of the Oquirrh range.

Bancroft describes the discovery as follows: "In 1863 Captain A. Heintz and a party from Camp Douglas discovered argentiferous galena and copper in Bingham canyon, on the east slope of the Oquirrh range, near the Jordan, and about thirty miles south of Salt Lake City. A mine was located in September of that year by a man



MAP OF UTAH, SHOWING SALT LAKE CITY, GARFIELD, AND BINGHAM

[4] 'History of Utah', by H. H. Bancroft. Page 741.

[5] Bancroft anticipates Connor's promotion; he was appointed major-general of the Utah militia in 1870. He played a prominent and useful part in Utah's early history.

[6] 'History of Utah', by Orson F. Whitney; Vol. II, p. 111.

named Ogilvie, and in December following, a mining district was established, named the West Mountain, and including the portion of the range between Black Rock, at the southern end of Great Salt Lake, and the fortieth parallel. In 1871 this district contained 35 mines."

Whitney's description may be compared with the foregoing: "A party of soldiers from Camp Douglas were guarding some horses belonging to the garrison which [the horses, not the garrison—Editor] had been sent to graze in Bingham canyon. They were joined one day by General Connor and a picnic party of officers and their wives from Camp [Douglas], and one of the ladies, while rambling on the mountain-sides, picked up a loose piece of ore. The soldiers at once prospected the vein, discovered it, and sticking a stake in the ground made their location, since which Utah has been known to the world as a rich mining camp. Another account, by the historian E. W. Tullidge, states that a man named Ogilvie, while logging in the canyon, found a piece of ore, which he sent to General Connor, who had it assayed. It was then, according to Mr. Tullidge, that Connor organized his picnic party and proceeding to Bingham Canyon located the mine, which was named the Jordan. Soon afterward Connor wrote some mining laws and held a miners' meeting at Gardner's mill on the Jordan river, where the laws were adopted and Bishop Gardner elected recorder of the West Mountain mining district. Thus was the ball set rolling."

In June 1864 another mining district, the Rush Valley, was formed, covering the western slope of the range and leaving the eastern slope to the West Mountain district, a name that, despite its inappropriateness, has persisted to this day. In 1864 the West Jordan Mining Co. was organized under Californian laws, and vigorous prospecting was begun; but these early operations languished, in spite of several handsome outcrops of galena, because of the many obstacles to mining. The lack of railroad transport rendered all supplies excessively expensive; a shovel cost $2.50, a keg of powder, $100. Moreover Mormon influence was effective in discouraging the settlers in the Salt Lake valley from participating in the development of the lead deposits. The discovery of gold, in 1864, by a party of Californians, returning from Montana to spend the winter at Salt Lake, led to the systematic washing of the gravel in Bingham canyon. A nugget weighing a little more than an ounce was found and these alluvial operations altogether are said to have yielded $1,000,000 during the ensuing six or seven years.

The first mining at Bingham was prompted by the silver-bearing lead ore that outcropped on the hillsides, by the gold found in the gravel of the gulch, and also by the gold mined from quartzose lodes penetrating the limestone. In 1882 four stamp-mills had been built to crush this gold-bearing silicious ore. The success of the lead mining was due not only to the silver contents of the ore in such celebrated mines as the Jordan, Galena, and Winnemucca, but also to the deep oxidation of the mineral, yielding easily reducible carbonate ores even at considerable depth, in such mines as the Brooklyn, Lead, and Yosemite.

According to Bancroft, "the first shipment of ore from Utah was a carload of copper ore from Bingham canyon, hauled to Uintah, on the Union Pacific, and forwarded by Walker Brothers to Baltimore in June 1868." This was before the transcontinental railway was completed by the linking of the Union Pacific and the Central Pacific railroads at Ogden on May 10, 1869, and it was two years before Salt Lake City was joined to the main line by the construction of the Utah Central railroad. The mention of copper so early is interesting, for no large shipments were made until December 1896, when 5000 tons of sulphide ore was shipped from the Highland Boy mine. It is worthy of note that the original Highland Boy company was started as a gold-mining venture by Samuel Newhouse, as promoter, and Thomas Weir, as manager. These two had so little idea of developing a copper mine that they built a cyanide mill to extract the gold in the oxidized ore. This mill ran for several months, but it was not a success, largely because the copper, of which they had failed to take note in their experimental work, interfered with the recovery and caused an abnormal consumption of cyanide. After this mill proved a failure and the company's affairs reached a critical stage, Mr. Newhouse, it is said, went to Denver in order to raise money to meet his delinquent payrolls, and while there he received a telegram from Mr. Weir informing him that ore containing 15% copper had been struck in the lower adit. This saved the day. Another story asserts that in the course of exploratory work in the zone of oxidation a winze penetrated sulphide ore. This so alarmed the management that the winze was covered. Later, failing to develop a successful gold mine and the price of copper making it attractive, the winze was reopened and a discovery of copper-sulphide was announced.

At first the copper deposits were overlooked. They were of low grade and not as easily smelted as the lead ores. The shipment of copper-sulphide ore from the Highland Boy in 1896 gave the first promise of a new departure and led to the transfer of this mine, with other claims, to the Utah Consolidated Mining Co., which, three years later, completed a smelter of 250 tons capacity. In 1897 the Stewart No. 2 and a number of adjacent claims were acquired by the Boston Consolidated Mining Co. These are mentioned by J. M. Boutwell in Professional Paper No. 38, U. S. Geological Survey, and in that report he has an addendum bringing the record of development down to 1902, but there is no suggestion of the enterprise that was to give world-wide fame to Bingham.

It is probable that the first mining on the present Utah Copper property was done at the time when Colonel Connor's soldiers began to prospect in the hills enclosing Bingham canyon, that is, soon after 1862, for the Soldier Tunnel, by its name, perpetuated that tradition. The oldest claim now included in the property is the Washington, which was located in 1865, whereas the latest

claim, the Emma Fraction, was located in 1907, four years after the Utah Copper Company had been organized.

The story of the Utah Copper enterprise begins with Colonel Enos A. Wall, of Indiana. As he himself acknowledges smilingly, his military title is one that he owes to his friends. His parents were North Carolinian; he started his mining career in Colorado in 1860 and went from there to Montana in 1863, varying the search for gold with general business as a freighter and trader in the material and supplies exchanged between that Territory and Utah, to which he came in 1868, remaining for 14 years. Then for five years he was chief stockholder and superintendent of the Wood River Gold & Silver Mining Co., an important enterprise at Bullion, Idaho, where he won the regard of his fellow-citizens so as to be elected to the upper house of the Territorial legislature and become President of that body of Solons, as, I believe, a newspaper reporter would call them. In 1885 he returned to Utah, engaging in mining at Mercur and elsewhere.

In July 1887 he went to Bingham, where he noticed a number of prospecting drifts and inclines driven during early days on the small fissures that traverse the quartzite and monzonite on both sides of the canyon. His attention was attracted by a discoloration on the hillside, visible from the road. The stream of water issuing from a spring just above the site of the present 'pit' of the Utah Copper mine had been conducted to a placer near the site of the present railway station. The bare rock on the hillside had become discolored and the gravel in the gulch likewise was stained green by the coppery solution. Upon examination, the ridge of rock proved to be an outcrop of monzonite impregnated with copper sufficiently to assay 3% for a length of 300 ft. An abandoned 'tunnel', 90 ft. long, had been driven into the hill on about the level of the present 'pit'. This tunnel had followed a short-lived fracture that had yielded pieces of ore rich in chalcocite, but the work evidently had proved unprofitable. Entering the tunnel, Wall broke a sample; upon the fresh face of the rock, under the green coloration, he saw that the monzonite was impregnated with black specks of chalcocite and bornite, suggesting a similarity to the ores of Butte, with which he was familiar. He sampled the tunnel, omitting the 20 ft. next the surface, where the copper-bearing rock was oxidized, and obtained an average of 2.4% copper by assay. Numerous tests by panning showed that a concentrate assaying 30 to 40% copper could be produced.

Upon enquiring at the Recorder's office, he ascertained that a large part of the ground adjoining and surrounding this exposure of mineral had been abandoned and therefore was subject to re-location; so he staked two claims, which he named 'Dick Mackintosh' and 'Charles Read', after two of his local friends. This gave him an area of 3000 by 600 ft., except a small fraction subject to conflict at one end. Subsequently he located another adjacent claim, which he named the 'Frank Cushing'. He found other old workings, one of them being a tunnel 250 ft. long on the opposite, or east, side of the gulch. This was nearly on the same level and about 700 ft. northeast of the one first inspected; it followed the so-called Quinn fissure, a gash marked by an irregular enrichment with chalcocite, similar to many other short-lived fractures traversing the monzonite mass. The ore in this fissure assayed 5 to 40% copper, but it was not in quantity sufficient to justify the method of selective mining that the former owner of the claim had attempted to apply. A new tunnel 600 ft. northward and on the same side of the gulch had been driven 200 ft., and was in continuous ore averaging 1.8% copper. These facts indicated an extensive dispersion of the copper. He investigated the titles of the claims adjacent to his own locations, meanwhile keeping his hopes to himself. He even agreed with the road-supervisor that the dumps be used for road-making, being willing to have the value of the ore ignored. The local wits called it 'Wall-rock'.

At that time he did not have enough money to start systematic development, but, from year to year, he did his assessment work. Later he made some money by sundry deals at Ophir and Mercur. For example, he sold the Brickyard mine, at Mercur, and cleaned up $60,000 on that. He developed the Yampa mine, near the Highland Boy, and made such a showing as to be able to sell it to George H. Robinson, for Moore & Schley, at a price of $150,000, as against the cost to himself of $40,000. He was not a promoter, but a miner and a dealer in mines, backing his personal judgment successfully and establishing a good bank-credit in Montana and Utah. He held to his faith in the copper-bearing 'porphyry' at Bingham, and looked forward, some day, to acquiring financial strength sufficient to enable him to provide the plant and equipment necessary to exploit the deposit on the large scale that it demanded. By aid of his winnings, he had been able to perform the assessment work on his own property as it became due; he had bonded other claims, and paid for some of them; so that when the success of the Highland Boy started a copper excitement in 1896 he had acquired ownership of 200 acres and had done $20,000 worth of exploratory work, as represented by about 5000 ft. of tunnels, drifts, and cross-cuts.

(To be Continued)

HYDRO-CARBONS are transformed into hydro-carbons of lower boiling point by bringing their vapors into contact with hot gases of combustion substantially free from oxygen. The hydro-carbon is thus subjected to a temperature of 700–3000° F. under pressures ranging up to 600 lb. per sq. in. The conversion is effected in a chamber into which a mixture of hydro-carbon and steam is sprayed by a nozzle, and the gases of combustion are led to a condenser. The gases of combustion are generated in a separate chamber fitted with a spraying device admitting oil or a mixture of oil and steam, having an inlet for air, and a pump for generating the requisite pressure. The method was worked out and patented by D. T. Day, F. Macdonald, and R. B. Day.

Similarities in the Legal Aspects of the Litigation Over Flotation, Cyanidation, and Filter Patents

By R. C. CANBY

*The very wide interest which present flotation litigation has evoked among the members of the mining and metallurgical profession recalls most vividly to mind the same general interest which was felt in the MacArthur-Forrest cyanide and the Moore filter cases. It may be of interest, therefore, at this time to recall briefly these two former cases, and to compare them and certain of their features with the present flotation litigation. We will find some interesting points which may help us to comprehend more readily the ethical elements of the flotation case.

There is in addition a coincidence—if not an actually premeditated connection—between the Miami flotation case and the Moore filter case, which has at least a strong human interest.

Briefly, the three cases may be stated as follows:

In the cyanide case, the MacArthur-Forrest patents were declared invalid for lack of invention in practically all countries, Mexico, however, being one of the exceptions.

The Moore filter patents were tested in a suit brought against the Tonopah Belmont Development Co. for infringement in their use of the Butters filter, a filter in which the filter-leaves were permanently fixed in the tank.

The U. S. District Court of New Jersey (Judge Rellstab) decided that the Butters filter did not infringe the Moore filter, but the Circuit Court of Appeals in Philadelphia reversed the finding of the lower court, sustaining the Moore patents in the very broadest sense.

In the flotation case, the U. S. Supreme Court has affirmed the validity of the Minerals Separation patent 835,120 in the Hyde case.

That this Supreme Court decision is to the effect that the process disclosed consists of a definite degree of agitation, a different character of froth product, in combination with a 'critical' amount of oil, was the conclusion of the Circuit Court of Appeals in the Miami case.

The Miami Copper Co., under my direction, had been conducting a series of flotation tests, at first with an air-compression method; then with a 50-ton Hoover type Minerals Separation agitation-froth machine; and at the same time, upon a limited scale, some experiments in a half-width, full-length, Callow cell, which I had built under Mr. Callow's instructions.

*A paper read before the recent annual meeting of the Canadian Mining Institute and published in the September bulletin of that Institute.

At the time we were experimenting with the 50-ton M. S. machine, the principal Minerals Separation patent No. 835,120 had been declared invalid by the U. S. Court of Appeals in San Francisco.

It was clearly understood that it was not the time to expect the Miami company to sign a contract acknowledging the validity of a patent that had thus been declared invalid.

As an indication, upon the part of the Minerals Separation's representatives, of a complete and cordial understanding of the Miami company's intentions, I may state that, when there was (at one time) a possibility that the Miami company might be obliged to temporarily shut-down its machine through lack of oil, the Minerals Separation representatives, of their own volition, offered to sell from their own supply such oil as the Miami company might need.

While the little 50-ton machine was of ample capacity to sufficiently demonstrate the suitability of the Miami ore to flotation, it was, upon the other hand, so insignificant an operation as compared with the Miami milling operations as to make it the merest technicality upon which to base an infringement suit; so the first Minerals Sparation suit came as from a clear sky, the bill of complaint including only the agitation-froth machine.

This first suit, however, later withdrawn and another suit instituted to include the second Callow experimental plant, which had been installed subsequently to the filing of the first suit.

As the suit was brought at Wilmington, Delaware, taking advantage of the fact that the Miami company was a Delaware corporation, one may well question if it were more than a coincidence that a suit upon this mere technicality should have been brought in this District Court, when one recalls that on the appellate bench of this district sat the very judge who had written the decision so broadly sustaining the Moore patents in reversal of such a sweeping opinion as that of Judge Rellstab.

However this may have been, it was apparent early in the Miami hearing before the Wilmington court that the plaintiff, Minerals Separation, was making every effort to present the Miami case along the lines of the Moore filter case.

This effort was especially evident in the discussion by counsel as to the admission of page after page of articles read into the court record from engineering journals by one of the plaintiff's witnesses, just exactly as had been done by plaintiff in the Moore filter case.

This tendency to line up the Miami case with the Moore

case was the more noticeable because of the fact that one of M. S. counsel in the Miami case had been counsel for the defendant in the Moore case, upon which side of that case it is presumable that he must have contested the very attitude now so eagerly pressed by Minerals Separation's counsel.

As we have seen, the defence in the Moore case had won a most signal victory in Judge Rellstab's decision in the lower court, but, upon reaching the Circuit Court of Appeals, Judge Buffington reversed the lower court, setting forth very prominently in his opinion the utility of the invention.

Accordingly, one can see that, no matter upon which side of the Moore case the learned counsel above referred to may have been, it is natural to presume that he must have been most strongly impressed by, and possibly hopeful of, a similar point of view from the same court in the Miami case following a similar presentation.

One cannot, of course, claim that M. S. counsel actually had any idea or expectation, or that the Miami suit was purposely staged in the Third District with the intent of obtaining its ultimate decision from a court in which sat the judge who had so signally sustained the Moore patents.

Upon the other hand, it is perfectly reasonable to assume that no suit against the Miami would have been brought in Arizona, where the alleged infringement had taken place, since this would have taken an appeal to the Circuit Court of Appeals in San Francisco, which court had declared Minerals Separation patent invalid.

But whether the bringing of the Miami suit in the Delaware court was thoughtfully planned with a view to the personnel of the appellate court, or was merely a coincidence, there is no question that Judge Buffington of the Circuit Court of Appeals for that district is generally conceded to be one of the most able patent judges on the bench. It is, therefore, not presumable that so able a judge has been inconsistent in his method of arriving at the opinions in these two cases.

In the Moore case he unequivocally sustained the patents; whereas in the flotation case it was he who wrote the minority opinion, in which he strictly limited the M. S. patents to agitation by mechanical means.

Judge Woolley, in writing the majority opinion of the Court, held that an agitation, provided it was of sufficient degree of violence and duration to produce the result of the patents, was, in effect, the agitation of the patents, whether produced by mechanical impellers, or by air jets as in the Pachuca tank.

Judge Buffington, on the other hand, not only confined the agitation of the patent to that by strictly mechanical means, but further restricted it to that of the inflow Gabbett, or its mechanical equivalent.

It is on this question of mechanical agitation that there is a difference between the majority and minority opinions extending to all three patents in suit.

The Moore filter case was tried in a district court of the same circuit as the Miami, but in New Jersey Judge Rellstab found that five of the principal steps of the Moore process, including the depositing of the material upon the filter by suction, were old in the art and already disclosed in prior patents cited. It was true, he said, that these prior patents were apparatus patents, and that these steps were only functional, but "then, of course, Moore's steps are but functional."

Judge Rellstab considered it doubtful if Moore's process constituted such an advance in the art as to amount to invention, but he did not actually pass upon this point, since he came to the conclusion that the Butters filter, with its stationary leaves, did not infringe the Moore filter.

Judge Buffington, in his decision reversing Judge Rellstab, sustained the Moore filter patent as a process of cyanide treatment, the features being:

(1) Formation of a layer of pulp of uniform resistance to the flow of solutions.

(2) Withdrawing layer from the pulp (or pulp from the layer) while holding the layer against the cloth by continuing difference of pressure within and outside of cell. (This covers both suction and pressure-tank methods, like Kelly) when not submerged.

(3) Submerging in wash solutions.

(4) Discharge by reversal of current, that is, blowing instead of suction.

Approximately one-fourth of Judge Buffington's opinion in the Moore case consisted of the quotations from technical journals, to which I have referred, setting forth the baffling difficulties which treatment of slime had always presented in the cyanide process, and the very urgent need which there had been for such a process as Moore had developed, thus indicating the tremendous utility of the achieved process, a description of which he quotes from an article by George Moore, himself, published in the 'Engineering & Mining Journal' a year before his patent was issued.

Judge Buffington states that Moore realized the importance of the *uniform resistance* of the cake. He says:

"It is contended, however, that the Moore patent is invalid by reason of the prior art. But in our view this contention is based on a failure to recognize the true significance of what Moore really did. . . . To find, therefore, here and there in the prior art patents, and dissociated from each other, all the mechanical appliances of the combination apparatus which Moore illustratively used, is not to prove that Moore's process is not original."

Judge Buffington states that Moore realized the importance and scope of his invention, and that what had therefore been waste-dumps, had now become of immense value.

How readily one thus recognizes from whence came so many of the echoes, which were heard in Wilmington as to the reclaiming of vast dumps. Surely if Judge Buffington had in the Moore case the power to discern so clearly the invention and the fullness of its scope, we cannot question but that he had brought the same keenness of insight and the same accuracy of analysis to the study of the Miami case.

In the Miami case, after quoting Claim No. 1 (Patent

835,120): "Adding a small proportion of an oily liquid (amounting to a fraction of 1% on the ore) and agitating the mixture until the oil coated mineral matter forms into a froth, and separating the froth from the remainder by flotation," Judge Buffington adds:

"I say, putting aside all minor incidents, for it is perfectly clear that, if all kinds of air flotation and all kinds and degrees of agitation are covered by this claim, the infringement of the defendant is self-evident, and by their use of compressed air, which produces some agitation and causes air flotation. To my mind and for reasons which I shall now discuss this claim should not be awarded this sweeping scope which will paralyze the subsequent development of a great art."

Judge Buffington then points to the necessity in the patent law that the patentee "particularly point out and distinctly claim the part, improvement, or combination that he claims as his invention or discovery."

He says of Minerals Separation process as held valid and described by the Supreme Court:

"In substance, it was the disclosure of a process in which a hitherto unused minimum of oil and a hitherto unused maximum of agitation were used."

He then fully sustains the fact that the Supreme Court had decided "that first the quantity of oil; secondly, the character of agitation, and thirdly, the resultant froth constituted the disclosure."

He says, "This discovery is bottomed on agitation," and then he quotes quite voluminously from the record, largely from the evidence stipulated from the Hyde case, which shows how insistently the inventors of the process had dwelt upon violent mechanical agitation, agitation with a Gabbett agitator, and how that they had tried a centrifugal pump but found the Gabbett preferable. Judge Buffington then says:

"To our mind this use of the literalism and verbiage of the one word agitation to foreclose this whole controversy, loses sight not only of the spirit of the patent law, but also of the principles on which this contract—for a contract with the Government is what a claim is—should itself be interpreted, for in construing that contract one must construe it as a whole, that is the claims plus the specification, and not the claims minus the specification. We must also consider the claims in the light of the evolution of experiments that led up to the discovery and consequently to the disclosure."

"If they had discovered the broad principle of oil to coat minerals and to reject gangue; if they had discovered the coating of air bubbles with oil; if they had first shown that oil-coated minerals and oil-coated bubbles would unite and rise to the surface, we could regard them as first-comers into a newly-discovered field and as entitled to make all further progress in that art servient to those who created it."

When one considers that these words are the words of the same judge who sustained the Moore filter patents in reversal of Judge Rellstab, although one must fully realize that in the Miami case Judge Buffington's opinion is the minority opinion of the Court, nevertheless one cannot but feel that a comparison of these two opinions is most reassuring to those of us who resist the claims of Minerals Separation to a practical monopoly of flotation.

The MacArthur-Forrest process also has many points which may well be compared to the flotation situation.

In both instances one cannot but feel that while actual proprietorship is rightfully withheld, none the less ample credit has undoubtedly been given.

Referring to my article in the 'Engineering & Mining Journal' (December 1, 1917) I there said, "The mining world should not fail to give due credit to the gentlemen (of Minerals Separation) for their marvelous perception as to the possibility of such processes. . . ." And as to the cyanide process, it has been truthfully said: "To these men, MacArthur and Forrest, is due the praise, not that they were the first discoverers, but that they pushed their invention and enabled a recovery of $14,000,000 in five years by their process, which would have otherwise been lost."

Nevertheless, the solubility of gold and silver in cyanide had been known and utilized many years. The precipitation of these metals from their solution upon zinc had been known and used, and there had also been several patents issued describing processes for ore treatment by cyanide.

In this connection, it may be of interest that, so far as I know, the writer was the first to try cyanide in a commercially operating milling-plant. This was done at the Sierra Grande mill, Lake Valley, N. M., in which the Russell process of hyposulphite lixiviation was being practised. A short run was made with cyanide solution as a trial of the process for which Dr. F. M. Endich and Mr. Nicholas Muhlenberg had a caveat in the U. S. Patent Office. (See 'Mining and Scientific Press,' July 1, 1916.)

This trial antedated MacArthur-Forrest by several years. The silver extraction by this cyanide test upon the ore crushed as it was to such a coarse mesh did not, however, show a sufficient improvement over the results of the hyposulphite process to warrant the use of cyanide at its greater cost in those days.

I do not know why the Endlich-Muhlenberg caveat was abandoned. It may have been that they encountered the Rae and the Simpson patents, or that they concluded the process to be unpatentable. I remember discussing with Dr. Endlich the question as to whether or not already known chemical reactions could be patented, and showing him the reactions involved in his process in Prescott and Johnson's 'Qualitative Chemical Analysis.'

It is not necessary here to go into any description of Rae's or Simpson's process. The patent, which was taken out in 1885, was styled a "process for extracting gold and silver from its ores," and that these patents were regarded as disclosures, may be taken from the judge's query, "if the MacArthur-Forrest patent were held valid, would not Rae and Simpson's processes if now used be liable to be stopped as infringements? I think they clearly would."

Here I think we have a very close parallel. If the M. S. patent 835,120 were sustained upon any such

broad basis as, for example, Judge Bourquin's decision in the Butte & Superior case would give it, would not all of the previously disclosed flotation processes be also infringements?

There is another strong resemblance between MacArthur-Forrest patent and Minerals Separation, in that in each, among other things, is the claim to the use of a limited amount of the reagent—8 parts of cyanogen to 1000 parts of water, in the one case; and a fraction of 1% upon the weight of the ore, in the other.

In replying to a most interesting article by Mr. MacArthur ('Mining and Scientific Press,' June 10, 1916), if I may again be permitted to quote what I have previously said, I stated:

"I agree, however, most fully with Mr. MacArthur when he says 'cyanide does this (dissolves gold from its ores and holds it in solution) and so far as I know it is the only solvent that can do it. This is the real essence of the invention. The matter of weak or strong solution follows as a matter of chemical economy.' Such an expression from Mr. MacArthur is apropos in the present flotation litigation, in which it is contended against the pretentions of the patentee of the minute quantity of oil, that it is the flotation by the use of such reagents, that is the real essence of the process, the matter of more or less of the reagent being a matter of chemical and commercial economies." (July 1, 1916, 'Mining and Scientific Press.')

We have along this line a very interesting court decision upon the Walderstein patent (U. S. Patent No. 601,719, claiming the use of a "definite quantity" or the "exact quantity" of zinc dust necessary to exactly precipitate the metal). The decision of the Circuit Court of Appeals of the Ninth Circuit, June 6, 1902, the same court which declared M. S. patent No. 835,120 invalid, says: (117 F. R. 240.)

"The patentee, not being the inventor of the use of zinc dust by means of agitation as a precipitating agent, the public is free to use such quantity of as may be required to best produce the desired result."

It was because of the disclosures of the prior art and of such sound judicial opinions as this, as well as the ruling of the U. S. Patent Office in the case of their own application, which made it so necessary for Minerals Separation to thoroughly emphasize those features, other than the limited quantity of oil, and to testify so strongly as to the greater violence of the agitation of their process, and as to the different character of their froth product—to the combination of which three elements, the U. S. Supreme Court in its decision has definitely bound them.

That the U. S. Supreme Court has so defined their process was strenuously protested by counsel for Minerals Separation during the appeal argument before the Circuit Court of Appeals in the Miami case.

That this limiting of the process of the patent No. 835,120 to a combination of the greater degree of agitation and a different character of product in combination with the critical quantity of oil was the intention of the Supreme Court was affirmed however by the Court of Appeals in the Miami case, and, as we have already seen, Judge Buffington went even further than the majority opinion as written by Judge Woolley, and confined this agitation not only to a greater violence than that of the prior art, but agitation by a mechanical means with a down current Gabbett or its mechanical equivalent.

In this paper I have given much consideration to Judge Buffington's minority opinion, not only because of the interesting coincidences as to his having reviewed both the Moore filter and the Miami cases, but because of the real value of his judgment in helping to form one's own opinion as to the equities in the Miami case.

The Moore filter process was the successful solution of the problem of leaching and washing slime in cyaniding, and while it is true that, in flotation it is the slime that is particularly adapted to the process, it was not the treatment of slime particularly, however, that the various inventors of the flotation process had in mind.

As I suggested in my article in the 'Engineering & Mining Journal' (December 1, 1917):

"Might one not much more consistently claim proprietorship to flotation of a minute particle in modified water than to admit the patentability, simply, of a minute quantity of the modifying agent?"

But as it was not particularly the treatment of slime but broadly a system of ore-concentration that these inventors had in mind, no one seems to have thought of this at a sufficiently early time as a possibly patentable idea.

But George Moore was confronted in his actual work in a small cyanide mill, in which he was financially interested, by the slime problem. It was to the solution of this problem to which he set his inventive skill, and evolved a successful method of procedure, one which Judge Buffington recognized as a 'process'.

The patents cited as previous disclosures were apparatus patents, and for the most part antedated the cyanide problem. But more than that, Judge Buffington recognized that for the particular purpose for which the invention was intended to be used, as already quoted:

"The saving of extraction is due to the fact that while the filter is in the slimes tank and the suction in operation, an equalizing action is taking place."

And this he considered the gist of the invention.

In the Miami case, counsel for Minerals Separation had much to say about 'slimes' and had one of their witnesses read into the record from technical journals, exactly as the plaintiff had done in the Moore case, lengthy articles dwelling upon the problem that slime presented in the concentration of ores just as in the Moore case slime had been the obstacle to cyaniding.

There is nothing said in the M. S. patent, however, as to their having any advantage in, or being particularly applicable to the treatment of slime. The patent claims broadly that they apply to a system of ore concentration. Ore concentration as an art was not broadly patentable, nor was flotation broadly patentable. The Supreme

Court of the United States has, therefore, as we have seen, definitely confined Minerals Separation to the use of greater agitation than that of the prior art, in presence of a critical quantity of oil, resulting in a froth-concentrate of a different character from that theretofore produced. We have both the majority and minority opinions in the Circuit Court of Appeals in Philadelphia, in the Miami case, concurring in this interpretation of the Supreme Court decision in the Hyde case.

In this brief comparison of these three important patent cases I have not attempted to dwell in any detail upon the Court's decisions, having in mind more particularly the relative equities of the respective cases. The question in my mind has been that of our rights in the matter: Are we morally right in resisting the claims which are being made by Minerals Separation, Ltd., to a proprietorship of the field of flotation so broad as to include the bubble-column method, such as the Callow cell, for example?

I am confident that any impartial study of these cases will fail to disclose any conditions of the Filter case paralleling those of the Flotation case, and that the equities in the Flotation case will not warrant any rights being claimed by Minerals Separation, other than the strictly limited sphere which the U. S. Supreme Court's decision has marked out.

On the other hand, the Flotation case seems to me to parallel the Cyaniding case much more exactly. In each the reactions, or elements, were previously known. In each there is a question of quantity, or degree, of reagent.

The Supreme Court was led to believe certain facts, the non-existence of which has since been shown. It is probable that should this case again reach the Supreme Court, Patent No. 835,120 will meet the fate of the MacArthur-Forrest patents, and with it will fall the so-called soluble agent patent and its accompanying patent. It may be, as counsel for Minerals Separation said in argument in the Miami case, at Philadelphia, that if the bubble-column were free to use, no one would use their agitation froth method. But this is of importance solely to these men employed in exploiting flotation patents.

The patent laws of the country were and are designed to encourage inventive genius, not for the purpose of creating an unwarranted monopoly. The underlying principles of the patent law are well illustrated in the cases under discussion. As clearly shown, the patentees are entitled only to such fruits as the proper interpretation of their patents rightly give them and nothing more. If an invention is an improvement in an art, it will take its place in that art, but is subject to be displaced by the legitimate use of that which is old, as well as by that which may follow, having greater efficiency.

NITRATE production at the Government plant No. 1, Muscle Shoals, Alabama, is proceeding at the rate of 11,000 tons per annum. This is from the first unit of the plant only. The nitrogen is obtained by the synthetic process from ammonia and not from the air. Power is derived from one steam-plant delivering 6000 hp., and 30,000 hp. is transmitted to the works from the Warrior River plant of the Alabama company. The cost of the first unit of plant No. 1 was $5,000,000. Two units of plant No. 2 will be turning out nitrate in October. The capacity of this plant will be 133,000 tons of nitrate annually and its cost when completed will reach $30,000,000.

Tungsten-Gold-Copper Ore in Korea

The Seoul Mining Co., operating a profitable gold mine in Chosen, has a valuable asset in its Soctarie deposit, the principal mineral being scheelite. The report for 1917, just to hand, contains the following on this reserve:

The Soctarie deposit consists of an extensive band of quartzite, interbedded with limestone, with an average thickness of 25 ft. This band is mineralized with tungsten, gold, and copper. The grade is low, the average of all ore milled to date being approximately:

WO_3 (as scheelite), per cent	0.3
Gold, per ton	$0.40
Copper, per cent	0.4

The large size of the deposit, and the increasing demand for tungsten, makes it appear that this contains great possibilities. A large amount of experimental work was done both abroad and at the mine. The problem of separating the concentrate into marketable products was fairly well solved; but on account of the heavy cost of all chemicals at present, and the much increased transportation charges now ruling, also the comparatively small output, it was not found practicable to erect a refining plant at the mine. No Japanese metallurgical works could be found sufficiently enterprising to join in taking over and refining the company's products at anything but most exorbitant rates. Consequently, in May 1917, as complete data had been obtained, it was decided to temporarily suspend operations. On the closing down of the Suan mine (about end of 1918), the whole mill of 40 stamps will be available for the Soctarie ore, when certain alterations are made.

The entire scheme is governed by the price obtainable for tungsten. If the company could depend on receiving anything like current American quotations, or if more normal freight-rates were in operation so that all products could be sent to San Francisco, where refining works are contemplated to treat mixed concentrate of the character produced at Soctarie, a much improved condition would arise, possibly allowing the company to consider the erection of a more suitable milling plant to treat the Soctarie ore. However, during the present abnormal conditions all proposals of this nature have been temporarily shelved, and the company is considering the question of the bulk milling of this deposit with the means available and under the conditions existing. An agreement has been entered into with Hamilton, Beauchamp & Woodworth, of San Francisco, by which the company has obtained the right to use their process of treating tungsten ores, and it is hoped that this will prove beneficial.

Why Prices Are High

By RICHARD HOADLEY TINGLEY

"It doesn't make any difference whether you like it or whether I like it," said the banker to the depositer one morning as the latter was folding up some crisp bills that the man in the 'cage' had just handed to him. "But you know the high prices now prevailing—and they are sure to go higher if that's any consolation to you—are a necessity if we ever expect to do our part in winning this war."

"What's that got to do with our winning the war?" returned the depositor. "People tell me that prices are high because our currency is being inflated: because there is too much gold in the country: because credits are too easy: and a lot of other things. Well, I don't pretend to know whether that's right or not. I never made much of a study of such things. I do know, however, that war always brings high prices; but I can't just see what high prices have got to do with our winning the War. I should think low prices would help more than high prices. If everything was cheap we could buy more grain, and steel, and munitions, and things to send over to the other side; and more ships to send them in, too."

"Now," continued the depositor as he saw the banker was apparently interested (though he didn't suspect why), "I'm making plenty of money in my business; more, really, than I ever made before; but what good is it going to do me if I can't enjoy it and have a little more to spend? My wife has been at me for years to have some alterations made in the house, and an addition put on to the west side, and a lot of other things done about the place. It seems to her, and it seems to me, too, that we ought to be able to afford it now, but when I come to figure up the cost it fairly frightens me. If things were more reasonable in price I could afford to branch out a little, now that business is better. Of course, I bought some of those Liberty bonds. I've done my duty in helping to win the War. I sold my B. & O. bonds to get the money to do it with. I didn't want to dip into that little nest-egg I've been saving up during the past year or two since business began to pick up, for I *might* change my mind about fixing up the house. But if prices go much higher, Mr. Banker, we'll all be ruined."

The banker had listened patiently, and, as the depositor exploited his views, his jaw began to set. He knew there were men holding much the same opinions, but he had never happened to run across one of them before; he saw it was time to say something and he said it.

"Mr. Depositor," said the banker, "sit down a minute. I want to talk with you a little about these things."

"In the first place," continued the banker, "the reason why I said that high and higher prices are a necessity if we want to win this War is that, if it were not so, if prices were low, you wouldn't hesitate a minute about beginning on those alterations to your house. And if they were low enough you would do a lot of other unnecessary things, for you would feel that you could afford it. The same thing would apply to thousands of other people: to millions of other people, very likely: and what would be the result? Your surplus savings would all go into unnecessary things: into things you *can* do without just as well as not. It isn't an absolute necessity that you make those alterations in your house. You've managed to get along in it as it is so far. In times like these such an undertaking would be an unwarranted extravagance. It would take labor and materials away from useful and essential things. Practices of this kind, generally adopted, would solve this war matter very quickly: we would lose: we would fail to do the part that has been laid out for us to do. Do you see the point? How much money were you thinking of laying out on your place? $4000 or $5000? Now, suppose there were a million people who thought and figured the way you do. That would amount to $4,000,000,000 or $5,000,000,000, wouldn't it? What chance would the Government have of selling its Liberty bonds if there were a million people that went into the extravagance of spending $4000 or $5000 apiece on unnecessary improvements to their homes?"

"If prices were low a great many other extravagances would be indulged in by more millions of people and all the surplus materials would be consumed in this way. You, and a million or more other men, must get this idea firmly in your minds: we can win this war only by the exercise of thrift, savings, and economy, and by the avoidance of all extravagance. Low commodity-prices stimulate consumption at home; a thing we do not want: high prices retard consumption: a thing we *do* want and must have. Prices must be so high that you, and millions of other men, won't think of putting any alterations on your houses; not while the War lasts, at any rate."

"An inflated currency is a war necessity but it has little to do with high commodity-prices. It is also necessary that we hold onto that big gold-reserve of ours; but the mere fact that it is here has little to do with our high commodity-prices—nor has the easy-credit situation, which is said to prevail. In point of fact there is no easy credit, commercially speaking, with us now. The credit of the United States is 'easy', as it ought to be. This is the only easy-credit situation I have been able to discover. There is only one reason why prices are high. It is because the demand for labor and materials is

greater than the supply. That's the whole story in a nutshell."

"You said you bought your Liberty bonds with money obtained from the sale of your B. & O. bonds. Why did you do this? Didn't you know that, in doing so, you had reduced the Liberty bond-buying capacity of the man who took your B. & O. bonds by just the amount of money he paid you for them? That is an unsound economic theory you are working on. Suppose a million other men, or ten million other men, did the same thing: sold something of value they owned to somebody else and bought Liberty bonds with the proceeds. Would our Liberty loans be successful? You can easily see they would not. If everybody took their savings: the money they would *like* to spend for alterations on their houses, and bought Liberty bonds with it: can't you see the difference?"

"There is a right and a wrong way of doing everything," continued the banker. "It is the business of us bankers, so far as possible, to help you business men in figuring out the right way to do things from a national economic standpoint. While you people are busily engaged in solving your particular problems and in making a living, and a little more, it is our business to see to it, if we can, that you do the right thing with that little more."

"No offence, Mr. Depositor: only figure these things out for yourself and see if I'm not right. In times like these we must all work together for the best interests of the country. We cannot be selfish in war times."

"Well, come around again some day if you feel like it and I'll go a little deeper into some of these economic questions with you that I have only briefly touched on today. I might, too, tell you something about the price-fixing policy of the Government."

Somewhat dazed by the new thoughts that had been so rapidly injected into his mind the depositor rose to go. "I have never thought much about prices and why they were high, nor of Government policies" said the latter. "I never looked into and tried to reason out the 'why' of it all, but you have told me some things today that I certainly didn't know before and I want a little time to think it over quietly."

"Any time you say so, and I'm at your disposal" returned the banker, and, as he watched the depositor pass out by the lines of people in front of the 'paying' and 'receiving' wickets, he couldn't help wondering how many of their number were in the same class as the man who had just left.

THE report of the Llallagua Tin Co. of Bolivia for 1917 makes remarkable reading, says the 'American Metal Market.' The gross profit was $8,218,000, against $2,237,000 in 1916. The dividends distributed absorbed $3,060,000, while $4,080,000 was allocated to future dividends. The capital of the company is $2,040,000, the interest and dividend reserve total $4,080,000, and other reserves $2,237,000. The production of concentrate increased from 7460 long tons in 1916 to 11,250 tons last year. Stocks of ore on December 31, 1917, were 261,902 metric tons, averaging 14.33% Sn, equal to 37,544 metric tons of fine tin. Costs of production, etc., were less in 1917 than in 1916, being last year $156.80 per ton of concentrate, against $172.80 in 1916. The largest increase was shown by the Llallagua company, which ranks second as a producing company, being surpassed only by the Patino company, whose last year's output was 13,300 tons of concentrate, against 10,000 tons in 1916.

GOLD DREDGING IN THE UNITED STATES is the title of a bulletin by Charles Janin just issued by the Bureau of Mines, Department of the Interior. Mr. Janin, in his introduction, says: "The recovery of gold from sands and gravels is one of the oldest forms of mining; it antedates history and has been practised by savage peoples. In North America the search for placer gold has been a powerful agency in the exploration and development of unknown regions and has profoundly influenced the course of our civilization. With the progress of invention, the improvements in machinery, and the availability of large capital for the conduct of great operations, the tendency in placer, as in many other branches of mining, has been toward the working of extensive but comparatively low-grade deposits. The early miner washed the rich spots in stream beds or terraces with his pan, his long tom, and his primitive sluice. Then followed the growth of hydraulic mining and the use of giants supplied with water under pressures of hundreds of pounds to the square inch that could work at a profit gravels whose gold tenor was less than three cents in the cubic yard. Finally came the dredge that could handle deposits lying so far below water level as to be beyond attack by other methods. Although the gold dredge was first successful on a commercial scale in New Zealand, it has reached its present strength and efficiency in this country and its development is a monument to the daring perseverance and technical skill of the many men, mine owners, and engineers who have each contributed something to the final result. The Bureau of Mines, authorized to conduct investigations for the purpose of increasing efficiency in the mineral industries, had its attention called some years ago to the need of a comprehensive report on gold dredging in the United States. The Director of the Bureau recognized that such a report should summarize the development of the gold dredge, should describe in detail the essential features of present-day dredges, should discuss the facts that determine whether a placer deposit can be profitably dredged, and should point out the approved methods of prospecting placer ground and of operating dredges. At the request of the Director, the author undertook the preparation of such a report and this bulletin is the outcome of his labors. He hopes that it will prove of interest to designers and builders of dredges, to mining engineers, and to persons who may contemplate investing capital in placer-mining ventures." Copies of this bulletin, No. 127, may be obtained free of charge by writing to the Director of the Bureau of Mines, Washington, D. C.

Copper-Leaching by Salt Water and Sulphurous Gases

By C. S. VADNER

Copper ores are not especially soluble in a solution of salt, but a salt solution impregnated with sulphur di-oxide gas becomes a powerful solvent for the copper. Such a solution might be represented as follows:

1. $xNaCl \cdot aq + SO_2 + H_2O = (xNaCl \cdot aq)H_2SO_3$

2. Dissolving various ores:

A. Green copper carbonate, or malachite.

$$CuCO_3 \cdot Cu(OH)_2 + (xNaCl \cdot aq) + 2H_2SO_3 = 2CuSO_3(xNaCl \cdot aq) + CO_2 + 3H_2O$$

B. Blue copper carbonate, or azurite.

$$2CuCO_3 \cdot Cu(OH)_2 + (xNaCl \cdot aq) + 3H_2SO_3 = 3CuSO_3(xNaCl \cdot aq) + 4H_2O + 2CO_2$$

C. Red oxide of copper, or cuprite.

$$Cu_2O + (xNaCl \cdot aq) + H_2SO_3 = Cu_2SO_3(xNaCl \cdot aq) + H_2O$$

D. Silicate of copper, or chrysocolla.

$$CuSiO_3 \cdot 2H_2O + (xNaCl \cdot aq) + H_2SO_3 = CuSO_3(xNaCl \cdot aq) + 3H_2O$$

E. Ferrous carbonate, or spathic iron ore.

$$FeCO_3(xNaCl \cdot aq) + H_2SO_3 + H_2O = FeSO_3 \quad 3H_2O + (xNaCl \cdot aq) + CO_2$$

F. Ferric oxide, or hematite.

$$Fe_2O_3(xNaCl \cdot aq) + 3H_2SO_3 = Fe_2(SO_3)_3 \quad (xNaCl \cdot aq) + 3H_2O$$

The solution of copper ores by means of sulphurous gas and water is by no means new, but where this treatment was attempted on a large scale at one plant many years ago, failure was recorded. Five reasons were assigned as causes for the trouble:

1. The attempt to saturate the water by simply blowing the gas through it.

2. The poor agitation obtained and the consequent length of time required to leach a comparatively small amount of ore.

3. The dilute solution obtained, 1% being the maximum amount of copper which can be held in solution by an excess of SO_2.

4. The ease with which the copper separates from these solutions, both in the leaching-tanks, pressure-tanks, and filter-tanks, forming the cupro-cupric precipitate throughout the mass of leached ore, which it was impossible to re-dissolve with sulphurous acid.

5. The difficulty of treating the remaining 40% of the copper in solution as sulphate after the 60% had been precipitated on scrap iron, which was not cheaply available. Among these reasons the following appears obvious: The solvent action of the solution is hastened by the use of heat, and, at a slightly elevated temperature, well below the boiling-point of water, the resulting solution readily decomposes and precipitates the red cuproso-cupric sulphite ($Cu_2SO_3 \cdot CuSO_3 \cdot 2H_2O$) even in the mass of pulp, and when this precipitate is once formed it is practically impossible to re-dissolve it by means of a solution of sulphur di-oxide in water; the attempt seemingly would be one in which a chemical difficulty was sought to be overcome by mechanical means, resulting negatively. Again, the solvent action of such a solution on the gold and silver contained in the ores, is not sufficiently complete.

After conducting numerous experiments with a view to overcoming what seemed to be the chief difficulty it was found that the obstacle could be surmounted as follows: a common soluble chloride, such as salt or other chlorides, or a mixture of these, was discovered to be a solvent for the red precipitate formed. When used in connection with SO_2 gas and water, it prevented the formation of the precipitate. This has been covered by patent. At ordinary temperatures, no apparent action taking place between the soluble chloride and the copper solution, it appeared that the mere presence of the soluble chloride had the desired effect. Realizing that a useful application might be made of this discovery of a cheap and common solvent, acting also to prevent the precipitation of the red precipitate, numerous tests were made on various types of ore, for the purpose of determining the effectiveness of this combination, both on the copper and on the gold and silver contained. The results are given below.

The material used in the preliminary tests analyzed as follows:

	%
Copper	1.3
Lead	trace
Silica	89.7
Iron	2.2
Zinc	0.1
Sulphur	0.2
Lime	0.7
Alumina	2.3
Magnesia	0.2
Gold	0.016 oz. per ton
Silver	0.21 " " "

The material was ground to 4-mesh and treated with a salt-sulphur di-oxide solution for six hours.

Analysis of tailing

		Extraction, %
Copper, per cent	0.35	66.00
Gold, ounces	0.015	6.25
Silver, ounces	0.1	52.38

On grinding the material to 20-mesh the following result was obtained:

Analysis of tailing

		Extraction, %
Copper, per cent	0.12	88.35
Gold, ounces	0.01	37.50
Silver, ounces	0.085	60.00

By grinding the material to pass 100-mesh still better results were secured, as shown:

Analysis of tailing		Extraction, %
Copper, per cent	0.09	91.96
Gold, ounces	0.006	62.5
Silver, ounces	0.08	61.9

Comparative tests made with sulphuric acid gave no better results even when special and more expensive chloridizing agents were used. The consumption of sulphuric acid on account of bases other than copper was 36 lb. per ton of ore. The results were thought to be so encouraging that an ore of the following composition from Arizona was selected for another test. The ore was ground to pass an 80-mesh screen and assayed as follows:

	%
Copper	6.8
Lime	1.5
Iron and alumina	10.5
Insoluble	77.3
Gold	trace
Silver	"

After treating with an excess of the solvent tailing assayed:

	%
Copper	0.05
Lime	0.68
Iron and alumina	1.25

This is an extraction of 99.1% of the copper.

The excess of SO_2 gas was easily eliminated, and was available for re-use if desired; the solution was hydrolized, and then on analysis was found to contain:

	%
Copper	1.000
Iron and alumina	0.072
Lime	0.162

The specific gravity was 1.1112, and the solution was practically neutral. The analysis of the oxide of iron recovered gave 54.7% metallic iron. The recovery of iron from ores and subsequently from the solutions as above, also carried by patent, is based on the following simple and cheap reaction: When sulphur di-oxide gas acts on an iron ore, in the presence of water, the reaction illustrated by equation *E* takes place and ferrous sulphite is produced, which in turn, by means of an oxidizing agent, such as the compressed air that is used in eliminating the excess SO_2 gas, is readily oxidized to blood red ferric sulphite, thus:

G. $$2FeSO_3 + SO_2 + O = Fe_2(SO_3)_3$$

In applying compressed air to eliminate the excess acidity of the solution due to presence of SO_2, a gentle heat is applied at the same time, so that dissociation of the ferric sulphite formed occurs practically simultaneously with its formation, thus:

H. $$Fe_2(SO_3)_3 = Fe_2O_3 + 3SO_2$$

The ferric oxide and SO_2 can be recovered from the solution at almost any desired stage of the process. It is proposed to make sponge-iron from the ferric oxide thus recovered, for use in precipitating the copper from solution. This reaction is hydrolysis of the third degree, being represented by the union of a weak base (ferric oxide) and a weak acid (sulphurous acid), which are easily dissociable by cheap and common agents such as water, compressed air, and heat.

Labor Unrest in Australia

Broken Hill, the lead-silver-zinc centre, had its usual share of labor troubles during the first half of 1918, according to the annual report of the manager, W. E. Wainwright, of the Broken Hill South Silver Mining Co. These are tabulated as under:

(1) Central mine (Sulphide Corporation), night-shift strike, from March 4 to 12.
(2) Blackballing of Amalgamated Zinc concentrate dump, from March 22.
(3) Amalgamated Mines Association, embargo on raises, from April 14.
(4) Amalgamated Mines Association, embargo on winzes, from June 4.
(5) Broken Hill Proprietary, steam-shovel strike, June 14 to July 24.
(6) Junction North, strike of carpenters working among acid.
(7) Amalgamated Miners Association, fatality strikes.

Miners contracting in the South mine averaged $4.94, and helpers $4.34 per 8-hour shift. In August all the mines at Broken Hill were again closed, due to a shortage of coal, which a union at Port Pirie in South Australia refused to handle.

Dolcoath and Mount Bischoff Tin Mines

These are probably the two largest and best-known tin producers in the world. They are widely separated, Dolcoath being near Camborne, Cornwall, and Bischoff in the north-western part of Tasmania. The reports of these two companies for the first half of 1918 are just to hand, and the following data are abstracted therefrom:

	Dolcoath	Mt. Bischoff
Method of mining	Workings 3000 ft. deep	Quarrying
Ore-reserves, tons		1,185,000
Metal content, per cent.		0.29
Method of milling	16 pneumatic stamps and concentrating plant	Gravity stamps and concentrating plant
Ore dressed last half-year, tons	32,783	44,041
Metal content, lb. per ton	20	7.3
Metal produced, pounds	941,700	322,500
Grade of metal, per cent.		99.86
Cost per ton of ore	21s.11d. ($10.06)	8s. ($1.93)

Dolcoath sells its tin oxide (concentrate) to smelters in Cornwall, but Bischoff has its own smelter, which also reduces the product of other mines. On the small capital of £60,000 ($288,000) Bischoff has paid nearly $12,000,000 in dividends.

THE non-current carrying metal parts of all electrical equipment on dredges shall be effectively grounded, according to 'Safety Rules' for gold dredges, issued by the California Industrial Accident Commission. Effective grounding on a wooden boat shall consist of linking the water-pipe system and the frames of the main and swing-winches together, with a suitable metallic connector, and effective metallic connection of the part to be grounded to this system. On steel boats, grounding to the frame of the boat by bolting to it, or by other equally effective means, shall be considered effective grounding.

Mining and Calcining Magnesite in Napa, California

In Pope valley, 20 miles east of Rutherford, a four-hour trip from San Francisco, is the White Rock magnesite mine. Napa county last year contributed 19% (40,218 tons) of the total (211,663 tons) of crude magnesite mined in California. The principal producer in the county was the White Rock, controlled by Frank R. Sweasey of San Francisco. The road to the property is picturesque, following Chiles creek most of the way. The mine is at an elevation of 1200 ft., and 500 ft. above the calcining-plant.

The main vein—for it is such, with distinct walls—is in serpentine, dipping 35°, whereas the orebody pitches north-west. From a 500-ft. tunnel, 200 ft. of which is used as the main outlet of the mine, are drifts that have developed, so far, 450 ft. of ore. Above these are five levels, showing 350 ft. of backs above the tunnel-level.

WHITE ROCK MAGNESITE MINE, POPE VALLEY, NAPA COUNTY, CALIFORNIA

TRAM TERMINAL, CALCINING-PLANT, AND ORE-BINS AT WHITE ROCK MAGNESITE MINE

Ore persists below. All broken ore passes down chutes to the adit. In the main vein there is an average of 15 ft. of ore; a parallel vein, east of the main orebody, opened for 40 ft., shows a 15-ft. face, and is most promising. Some open-cut work has been done on this new ore-shoot. The stopes in the main vein are filled, pillars being left to support the ground; but eventually these will be extracted, allowing the hanging wall to cave. Two Chicago Pneumatic company's compressors, each driven by a distillate engine (semi-Diesel), supply air to an average of 10 stopers and jack-hammer drills. Inclusive of engine-men, blacksmith, etc., 65 men are employed at the mine, which is in charge of Arthur Deleray, with William Lewis as foreman.

From the outlet of the mine the ore is run over a two-inch grizzley. The oversize goes direct to the kilns. The undersize, carried to the tram-terminal, goes through a revolving trommel with 1¼-in. perforations. The oversize is fed into the kilns, while the undersize is dropped onto a 1¼-in. shaking wire-screen. What passes through is discarded at present, being high in silica.

Between the mine and the calcining-plant, a distance of 5000 ft., with a 500-ft. fall, is an aerial tram. This has given satisfactory service. It is partly a gravity machine, but is helped by a 7-hp. gasoline engine. It carries sixteen 1000-lb. buckets, and has a capacity of 20 tons per hour. Three men take care of this tram. Besides carrying ore, it takes some supplies to the mine. The cost of operation is from 10 to 12 cents per ton.

An average analysis of the crude ore is as follows:

	%
Silica (SiO_2)	1.94
Iron oxide (FeO)	1.49
Lime (CaO)	0.67
Magnesia (MgO)	45.01
Carbon di-oxide (CO_2)	50.65
Total	99.76

The lime is frequently less than the percentage quoted; the iron more, up to 2.5%. The calcining-plant consists of 11 vertical kilns, all 24 ft. high, with 35-ft. stacks. Five of these are of 5½ ft. diameter; they have steel jackets, lined with 13 in. of firebrick. Three others have an inside diameter of 6½ ft.; while the remaining three are 6 ft. in diameter; these are of brick, 18 in. thick, strengthened by steel bands.

Alternate layers of coke and magnesite, in the proportion of 1:12, are dumped into the kilns from the feed-floor. Coke, from Alabama and Tennessee, is used. Natural draft is sufficient to 'burn' the ore in 24 hours, that is, for the crude ore to pass through the kilns. Their capacity is 6 to 7 tons each of calcined ore per day, containing about 0.50% CO_2. The ore is fairly cool when drawn off. At the bottom of each kiln are four discharge-doors, which feed ore-cars running on a track on both sides of the kilns. The ore is either dumped directly into one bin or crushed, elevated, and put into another bin, as desired by the consumer. Twenty-five men are employed at the plant, which is in charge of Joseph Rose. A laboratory is maintained for analyzing crude and calcined ore. At both the mine and plant, camps are maintained for employees.

An average analysis of the 'burned' ore is given below:

	%
Silica	4.60
Iron and alumina	4.46
Lime	none
Magnesium oxide	90.46
Ignition loss	0.48
Total	100.00

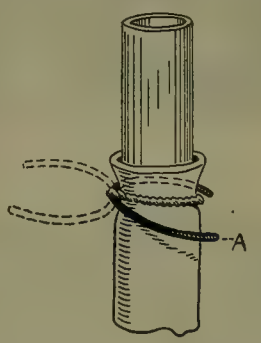
The high iron content of this ore makes it desirable for refractory purposes, such as the lining of steel-furnaces, and is used both in the East and on the Pacific Coast.

From the calcine-bunkers the ore is carried to rail at Rutherford in 5-ton White and Packard auto-trucks. Two round trips can be made in 10 hours. The monthly output of the mine is 3500 tons of crude magnesite, or 1750 tons of calcined product.

Connecting Glass and Rubber Tubing

By C. C. KIPLINGER

In gas analysis, trouble is experienced frequently in the attempt to make tight connctions between glass and rubber tubing. Experience has shown that this is accomplished best by wrapping a single turn of wire about the joint and twisting tightly. However, there are two objections to this method. The wire tends, if twisted tightly,



to cut the rubber, and if the rubber tubing is appreciably over-size, the tubing is compressed or pinched near the twisted portion of the wire, frequently making a small channel through which leakage occurs. The device herewith described overcomes these difficulties, permits the use of over-size rubber tubing, and insures joints that are gas-tight and water-tight. It has been used throughout the year with Liebig condensers and gas apparatus and has given complete satisfaction. *A* is a piece of stout wire bent in U-form of such size that the limbs of the U will just slip over both tubes. A loop of stout cord is tied about the connection, the wire U is slipped through this loop, as shown in dotted lines, the cord now twisted, using the wire as a lever, and, as soon as the joint is tight, the U is turned as shown at *A*. Cord is better than the usual copper wire for this purpose, in that the former distributes the force more uniformly throughout its length. A further advantage of this mode of attachment lies in the ease with which it may be dismantled, requiring, as it does, no pliers or other tools for this purpose.—'Jour. Ind. & Eng. Chem.'

REVIEW OF MINING

CHICAGO, ILLINOIS

Meeting of the American Bankers' Association.—Resolution Asking the Government to Sustain the Gold Industry.

The annual convention of the American Bankers' Association assembled here on Monday, September 23. Over 4000 out of the total membership of 19,000 throughout the country, were in attendance. This is a larger proportion than ordinarily responds to the call for these periodic meetings. The unusual circumstances of war have brought into existence new problems and new difficulties, and these considerations have increased the national interest in the work of the Association. Representatives from all departments of the Government were present, and Secretary Daniels arrived on Friday morning. George E. Chamberlain, chairman of the Committee on Military Affairs of the U. S. Senate, addressed the convention on 'Universal Military Training and Compulsory Service.' Harry A. Wheeler, president of the Chamber of Commerce of the United States, spoke on 'The Merchant Marine and the Railroads.' Of special interest to the mining world was the action taken on Friday concerning the need of stimulating the declining gold industry. This was an extension of the views expressed by the Pacific Coast Bankers' Gold Conference at Portland, Oregon, on September 5, at which the leadership of A. L. Mills, E. G. Crawford, John Clausen, and H. N. Lawrie resulted in a flat declaration for relief to the gold miners for the sake of adding to our gold reserve. At Chicago, Messrs. Mills, Crawford, and Eugene Davis were especially active in presenting the case for the gold industry, and with the support of large financiers close to the ear of the Treasury officials the following resolutions were adopted:

Whereas, the gold production of the world is rapidly decreasing, and

Whereas, the only form of relief that will prove effective and can be applied promptly is action by the United States government in such form and by such method as may be deemed fit and proper under the circumstances, and

Whereas, gold is the standard of value and the basis of all credit, and is of vital importance to the financial and commercial life of the Nation and of the world; now, therefore, be it

Resolved, That the American Bankers' Association in convention assembled respectfully requests and urges upon this Government of the United States the desirability of maintaining the production of gold to at least its pre-war volume, and asks that steps be taken immediately to that end; and be it further

Resolved, That the secretary of this Association be and he hereby is instructed to send a copy of this resolution to the President of the United States, the Secretary of the Treasury, and the Secretary of the Interior, advising them of its adoption; and be it also further

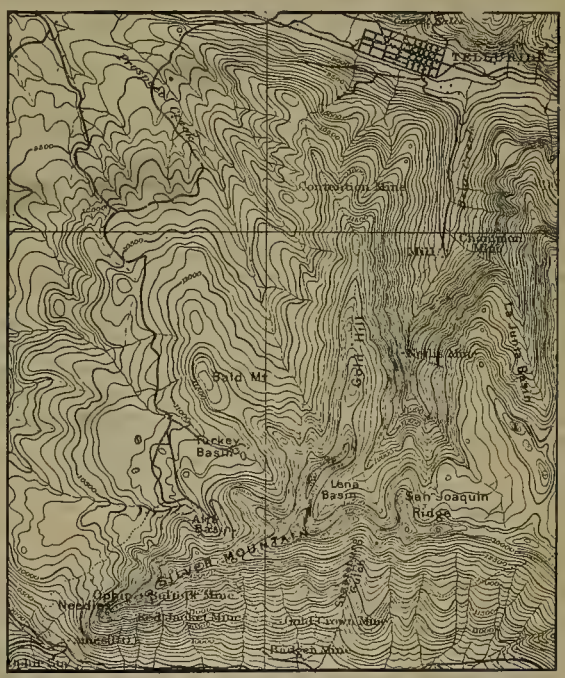
Resolved, that considering the great importance of this subject, this Convention recommends to the Executive Council that the matter be referred to the Federal Legislative Committee and the Currency Commission for exhaustive study and such action as may be deemed necessary.

As affecting the gold industry, the main features of the Bankers' convention may be briefly summed up as follows: There was a surprising lack of information with reference to the condition against which the gold-mining industry now is contending; also there was a lack of general interest in the subject; and finally there was suspicion of any proposal for relief emanating from the gold miners. Nevertheless, the endorsement of the Western bankers, and the presentation of figures revealing the dangers threatening the continuance of gold production, resulted in a declaration in favor of Federal investigation and action.

DURANGO, COLORADO

Review of the La Plata, Ouray, Red Mountain, Rico, Silverton, and Telluride Districts.

Telluride.—Among the most interesting news of this district is the purchase of a share in the Carbonero by the Tomboy Gold Mines Co., formerly owned by George Pickett.



TELLURIDE DISTRICT, COLORADO. THE PROPERTIES AND NEW MILL OF THE BELMONT-WAGNER ARE IN THE ALTA DISTRICT. (U. S. G. S.)

It is expected that the Carbonero will develop into one of the best producers in the Ophir district, as the ore carries iron and copper, also other metals in payable quantity. Part of the workings have been sub-leased to Ruuttila-Brown Leasing Co., which is shipping ore. D. A. Herron, of the Tomboy company, estimates an output of over 100 tons per month of shipping ore.

The Tomboy company has increased the wage-scale by 50c. per day.

The Belmont-Wagner company is now dispatching over four cars of concentrate per week. At present the only hindrance is the shortage of cars to carry concentrate to the smelter. Among the difficulties encountered by the Belmont-Wagner company were the necessity of splitting in two, and subsequently welding together of the huge compressor, in order to transport it over the steep and poor road leading to the mill. When the mill was starting, the grinding department was a prolific source of trouble, and a small mill was converted into a re-grinding unit. The Marcy mill has been re-built. After the mill was running for a short while, it was discovered that the diaphragm-pumps failed to lift the concentrate from the thickener-tanks to the filter, so that it was necessary to put in a wet elevator. At present all difficulties seem to have been overcome, and the recovery has been gratifying. The ratio of concentration is 12:1, and from 15 to 18 tons of concentrate is produced daily.

La Plata.—There is little mining activity in the La Plata. Prospecting is not being carried on to any great extent. Present costs of operating preclude the possibility of making profits from any but high-grade gold and silver ores. A bonus on gold would be a great help to this region.

The Valley View Consolidated Gold Mining Co. continues to operate, and ships one car of ore monthly. Extensive development is being carried on.

Owners of the Durango Girl recently sent out ore that carried over 60 oz. of gold per ton. They generally make a similar small shipment each year.

Ouray.—Mining is quiet, owing to the light demand for silicious ores and the heavy operating and transportation charges.

The Ouray Consolidated M. & M. Co. has acquired the National Bell, and will develop as soon as the Treasury tunnel is in condition.

Red Mountain.—Although great difficulty has been experienced in securing labor, in spite of a wage of $5 per day, extensive development and ore shipments are being made. Labor difficulties have been partly obviated by sub-leasing, whereby the miners can make better than wages. By this system some properties are producing heavily, especially the Congress Leasing Co.——The Kapegi Leasing Co. has been tied-up by litigation, in which one of the members of the firm has become involved. A large quantity of ore that had been shipped was awaiting delivery and settlement; but the proceeds were attached, leaving the operators short of capital, so that the work will probably be at a standstill until the difficulty is settled. The new orebodies recently opened average 12% copper.

P. W. Clark & Co. are working over the Yankee Girl dump, under a sub-lease from the Red Mountain Mines Co. They expect to ship 600 tons during the season.

Rico.—Now that the scale of pay prevailing in the Silverton and Telluride districts has been adopted in the Rico district it is expected that ore production will be greatly increased. During August there was dispatched 23 cars of ore, 14 by the Marmatite, 8 by the Rico-Argentine, and 1 by the Rico Wellington.

Silverton.—Many new names are being added to the shipping list this season. The high cost of labor and supplies have handicapped the smaller operators. The San Juan is receiving attention from outside capital.

The Henrietta Copper M. & M. Co., newly organized, is overhauling all of the Henrietta properties in the Gladstone region, and is now ready to ship. Under the direction of Mr. Kendricks of Denver sufficient capital has been secured to pay all indebtedness and to carry on development.

The Caledonian M. & M. Co. has its extensive development campaign about completed. During the past two years the operators have expended large sums of money in preparing the mine for steady production. This is satisfactory to all interested here. The new 75-ton mill is in operation. Among the equipment is a Samson crusher, triplex rolls, a ball-mill, a Hyde flotation machine, and four Wilfley tables. For the present the mine and mill are working one shift. G. A. MacKenzie is in charge.

The new tram terminal of the Silver Ledge company has been completed, and a large quantity of ore has been moved, 300 tons having been concentrated at the North Star mill. This company has been handicapped by considerable litigation over royalties and milling concessions, in addition to sustaining heavy losses by the fire that destroyed the mill last August.

Some interesting facts regarding the recent sale of the Gold King mines are as follows: The property known as the Gold King consists of over 150 acres of patented ground. The properties known as the Gold King Extension Mines Co. have an area of 55 acres extending between the Gold King and Sunnyside properties, so that the total holdings of the new company will be 205 acres. Officers are: president, Herbert S. Hadley, of the State University at Boulder; J. N. Nicholson and Rufus G. Gentry, vice-presidents; G. W. Kinney, treasurer; G. Dexter Blount, secretary; board of directors, Addison J. MacCune, F. D. Stackhouse, O. B. Haley, S. L. Moe, John Fleming, of the Law School at Boulder, and W. Z. Kinney. The rumored price is around $5,000,000. Among the equipment is a 300-ton flotation mill.

Interesting work has been that of Anderson & Holmgren on the Veta Madre. Although the old workings had not been re-timbered, or cleared for many years, the operators cleared out the workings and timbered so quickly that they are now starting to ship ore.

Mears & Wilfley have been concentrating a much higher grade of tailing from Silver Lake basin. Present shipments of concentrate carry over 1 oz. gold, and 10% copper.

The Sunnyside M. & M. Co. is shipping concentrate at the rate of about 20 cars per week.

The Red Mountain Mines Co. is shipping some crude ore from its holdings and from sub-lessees. Ore is now being dressed by the North Star mill at Silverton; concentrate contains over 50% lead, also high value in other metals. Zinc concentrate is shipped to Florence.

HOUGHTON, MICHIGAN

Effect of Labor Shortage.—Cave at Centennial.—Diamond-Drilling by Copper Range.

Suspension of work at the Houghton mine makes the tenth exploratory property to be closed in this district since the beginning of the War.

The old workings of No. 2 Centennial caved to the first level last week, making a hole at the surface 50 ft. in diameter and 30 ft. deep. The shaft has an angle of 40°, and there is little danger of any further caving. This shaft produced 500 tons of ore daily, so there may be a temporary interference with production.

Franklin continues to send ore to the mill at the rate of 800 tons daily, also continues to pay 20c. per ton for haulage, against 10c. paid by the Hancock. The Government has this situation under advisement, but has made no adjustment as yet. Franklin employs 250 men.

Wolverine's mill is working two shifts, concentrating 800 tons daily, while its capacity is 1400 tons. This is one result of the labor shortage.

Mohawk keeps three stamps dropping, mostly full time. The shaft at the mill is down 50 ft. The tunnel from this shaft, when bottomed, will extend half a mile under the lake.

Copper Range continues diamond-drill work at the Challenge property, 1½ miles south of the Champion mine. The seventh diamond-drill hole is now down 300 ft. This work is for geologic investigation. Some of the cores have

carried copper. The mines of this company—Champion, Trimountain, and Baltic—are producing 35% of normal; and there is no hope of any improvement.

Quincy has raised wages, making a minimum of $4.80 per shift, plus a bonus of 15c. for men who do not lose a shift between pay-days.

Allouez has added another trolley locomotive for underground tramming. Three more of the storage-battery type are to be ordered.

It has been mentioned in these notes that many men were going to Detroit, attracted by visions of high pay at munition factories; they have been disillusioned and are starting to return to the Copper Country. Rent here is from $4 to $8 per month, living in company houses; at Detroit a similar house costs $45.

COBALT, ONTARIO

Professional Ethics and General Development in the District. —Larder and Kirkland Lake Areas.

A case recently tried by Mr. Atkinson, police magistrate, at Cobalt, involved a somewhat important question as to the respective rights of mining engineers and surveyors. M. P. MacDonald, an engineer, was charged with infraction of the Ontario Land Surveyor's Act by doing underground surveying for Cobalt mining companies. Under the Act, the surveyors are the authorized technical body for making surveys for recording purposes, but it was contended that MacDonald was entirely within his rights in doing mine surveying on properties of which the boundaries had been recorded. This is a common practice at Cobalt. The Court upheld this view, and dismissed the case. A contrary decision would have entailed the necessity of re-surveying the workings of many properties.

The Kerr Lake closed its most profitable year on August 31. Its output for the period was over 2,575,000 ounces.

The Nipissing company states that development has been somewhat hampered on account of the part destruction of the aerial tram connecting No. 73 shaft with the low-grade mill.

The Mining Corporation is pumping sand and slime from the bed of Cobalt lake at the rate of 1000 tons daily, and treating 300 tons, stacking the remainder for treatment during the winter.

The recent discovery of high-grade and milling ore at the 350-ft. level of the Violet mine of La Rose is regarded as of more than ordinary importance. The ore-bearing zone is in Keewatin formation, about 20 ft. above the diabase contact, which has a considerable dip to the east, making the probable ore-bearing area of considerable size. An entirely new vien has been uncovered on the 330-ft. level.

Larder Lake.—Little has been heard recently about the Larder Lake district, owing to its distance from rail. One company appears to be making good. The Associated Goldfields, which has 2000 acres, is steadily developing with 30 men. At the 500-ft. level, a cross-cut on a large orebody has been driven 60 ft. in ore; while on the 100-ft. level, in another section, a drift on a wide vein has been driven 100 ft., with ore still in the face. It assays $32 per ton.

Kirkland Lake.—The purchase of the Orr property by the Kirkland Porphyry, which has worked it for a year under option, has been completed. The price was about $500,000 of which $100,000 was paid and security given for the balance.

At the Elliott Kirkland, diamond-drilling is being carried on from the 500-ft. level to determine the trend and extent of the rock formations.

The Burnside, which has lately found a good deal of high-grade ore, has completed arrangements for the erection of a small mill.

Boston Creek.—Another rich discovery of gold has been made on claims owned by James Hughes and Thomas Middleton, of Haileybury, lying adjacent to the Miller Independence. C. B. Flynn, of New York, and associates have obtained an option on the property at a high figure.

The shaft of the Miller Independence is down 200 ft. and the work of cross-cutting the vein at that level has commenced. The rich ore found at the surface persists to the present depth.

VICTORIA, BRITISH COLUMBIA

Platinum, Fluorspar, Iron, and Dividends.

There is a prospect that the Peace River country, a large area in the extreme north-east of this Province, will become a platinum producer. A syndicate, at the head of which are W. L. Hartman of Detroit and L. Bright of Chicago, is reported to have secured control of extensive placer ground to which will be shipped this fall two large Keystone drills and a modern dredge, with a capacity of 100,000 cu. yd. of gravel per month. Prospecting is said to have proved the presence of both platinum and gold in payable quantities.

When the Hon. William Sloan, Minister of Mines, accompanied by J. E. Thompson, member for Grand Forks in the Provincial legislature, was making an inspection of the plant of the Consolidated Mining & Smelting Co. at Trail just about a year ago, he was told of the hydro-fluosilicic-acid problem. It was pointed out that the fluorspar necessary in its manufacture had to be imported from Kentucky, a distance of from 1500 to 2000 miles. This made the cost so high that the discovery in this Province of such a deposit was a matter of importance. The company has since bonded claims known as the Rock Candy group, on the north fork of the Kettle river, above Grand Forks. Since acquiring control, much development has been done, a car of ore having been loaded for Trail. No time was lost in putting the property on a producing basis, and in view of the difficulties that had to be overcome the work accomplished in a short time is worthy of note. The company first had to build a trail, over which supplies and equipment, including a diamond-drill outfit, had to be packed in on horses. On the return trips the horses brought out ore, so that the company could get a car for testing purposes at an early date. A right-of-way had been cut through for a new wagon-road, toward the construction of which the Mines Department is assisting, and before winter the mines are expected to make regular shipments.

A rich development is reported from the Lanark mine, Illecillewaet, one of the oldest mines of the Province. One ore-shoot has been opened for 350 ft., without its limits. There is 14 in. of 50 to 70% lead and 40 to 100 oz. silver ore, and 4 to 5 ft. of concentrating ore carrying 20 to 25% lead. Forty thousand dollars worth of machinery is being erected.

The Ladysmith Smelting Corporation has again ceased operations at Ladysmith. Its smelter was run for a short time, when an accumulation of ore was disposed of. It is understood that the options it had taken on a number of mining properties in order to assure a constant supply of ore for the smelter will be allowed to lapse.

Dividends declared by the principal mining corporations in the first eight months of the current year are as follows:

Company	Amount
Granby Consolidated	$1,124,886
Consolidated M. & S.	523,872
Hedley Gold	72,000
Britannia M. & S.	198,415

If the smelter tests prove favorable, immediate development of considerable deposits of bog iron, situated on the mainland of British Columbia and near the Pacific Great Eastern railway, is promised by the operators of the Irondale, Washington, foundries.

THE MINING SUMMARY

ALASKA

Juneau.—Telegraphic reports state that on September 26 the heavy rainfall had caused much damage in this district, resulting in suspension of generation of power and mining operations.

ARIZONA

Benson.—Los Conquistadores Mining Co. has been organized and is selling shares to operate a gold mine 14 miles north of this place. There has been some development done on the property.

Bisbee.—Shattuck-Arizona produced 682,861 lb. of copper, 199,528 lb. of lead, 14,189 oz. of silver, and 113 oz. of gold in August. The copper output is still below the normal of over 800,000 lb. The lead is always irregular.

Calumet & Arizona produced 4,376,000 lb. in August, about a normal yield.

Duncan.—The Maple-Lissa Syndicate, which is operating the Phillips fluorspar property, 10 miles north-east of Duncan, has shipped its second car of spar. Ten men are now employed.

Another syndicate of local men is opening fluorspar in the vicinity of the Phillips property.

Shipments of manganese will commence shortly from two recently opened mines at Cap mountain, south-east of Duncan.

Jerome.—United Verde Extension pays 75c. per share on November 13. This amounts to $1,125,000.

Shipments were started from the Jerome Verde on September 17 to the smelter at Humboldt. There are 60 tons of ore in bins and as much more broken in the stope. Extraction is being made from the fourth floor above the 900-ft. level of the Maintop claim.

Five headings are being driven in the Pittsburg-Jerome, four on the 500-ft. and one on the 900-ft. level. The crosscut on the latter has shown nothing of note.

The Dorothy May shaft of the Green Monster is in 990 ft.

The diamond-drill work at the Calumet & Jerome has been practically completed. Some good-looking ground was cut, but nothing of importance was exposed. The management has made no announcement as to future plans, but it is probable that future development will depend largely on conditions exposed in the neighboring Verde Combination and Gadsden properties.

Metcalf.—The Shannon Copper Co. produced 708,000 lb. during August. This is a decrease of 86,000 lb. when compared with July.

Wenden.—The Black Reef Copper Co. states that it has decided to close its mine until after the War. When work is resumed, exploration will be done by diamond-drilling from the 500-ft. level. The property is 9 miles north of Wenden, in Cunningham pass.

ARKANSAS

Batesville.—A detailed examination of the manganese deposits of this region has recently been made by H. D. Miser of the U. S. Geological Survey, which has issued a preliminary report. The developed deposits lie in a belt 20 miles long by 4 to 8 miles wide, extending north-east through Independence, Sharp, and Izard counties. Mr. Miser visited 180 mines and prospects, most of which have produced ore. The output from 1850 to 1917, inclusive, was 65,261 tons, plus 61,330 tons of manganiferous-iron ore. Only 11 mines have yielded over 1000 tons of ore. The Southern mine contributed 36,000 tons to the total. The ores are chiefly the oxides psilomelane and braunite. Some wad and manganite also are minable. All classes of ore are found in the Cason shale and in the underlying Fernvale limestone. Rock changes resulted in the ores being in the residual clays of these formations. These clays

PART OF ARKANSAS, SHOWING POSITION OF MANGANESE AREA.

contain ore in ratio ranging from 3 of clay to 1 of ore to 35:1. The best ore contains 45 to 52% Mn; some up to 60%. Most carry 3 to 8% iron, 0.15 to 0.30% phosphorus, and 2 to 8% silica. The ferruginous ore carries 20 to 40% Mn, 8 to 20% Fe, and 5 to 26% SiO_2. Three grades are made, sorting being done by hand. Estimates of reserves show at least 250,000 tons of 40% and 170,000 tons of less than 40% Mn ore. No shafts are deeper than 132 ft. Drifts must be well timbered. Windlasses or horse 'whips' are used. There is plenty of timber available, also water. Wages are from $2.50 to $3 per day. Mining costs are as high as $28 per ton of high-grade ore. Transportation facilities are lacking, and a large portion of the ore has to be hauled 7 to 10 miles. Unless present crude methods and high costs are improved, the industry cannot thrive or meet lower prices for ore. The manganese is used for making ferro, spiegel, and pig-iron.

CALIFORNIA

San Francisco.—On September 30, H. G. Butler, State Power Administrator, removed all restrictions on the use of power by gold dredges. This is effective for 30 days, but will be re-imposed if there is no more rain in the mountains. Gold mining and power are referred to editorially in this issue.

Grass Valley.—The Allison Ranch mine has been unwatered to the 900-ft. level, and development of ground above this is progressing.

It is stated that G. W. Root has made arrangements to finance the re-opening of the Kenosha mine, owned by the Alcade Gold Mines Co. The main shaft is 450 ft. deep. There is a good electrically-driven plant ready.

Keswick.—Completion of the Mountain Copper Co.'s enlarged flotation plant at Minnesota station on the Iron Mountain railroad is greatly delayed by the inability to get machinery as ordered.

Knob.—The chrome mines on Beegum creek, a few miles from this place, have been shut-down for the winter. There are 700 tons of ore waiting to be hauled, and that is all the trucks can carry to the railroad at Redding before next spring.

McCloud.—Twelve carloads of pumice, from Pumice mountain, 28 miles from Bartle, have been shipped East this season. The claim belongs to C. M. Depew of San Francisco. The mountain is 7000 ft. high, and appears to be all pumice. The material has to be trucked 9 miles to the end of a lumber railroad. Experiments are being made in using the pumice in concrete work—such as floors—where lightness would be of advantage.

Redding.—Charles H. Spinks is developing 13 asbestos claims on Mears creek, west of Hazel Creek post-office. The property is the subject of litigation.

Weaverville.—The 40-stamp mill at the Fairview mine, near Minersville, is being dismantled and hauled to Redding for shipment to San Francisco. The mill has stood idle for 18 years. There is nearly 100 tons of iron and steel in the lot. There is no hoist as the Fairview was opened by tunnels.

COLORADO

Breckenridge.—The Tonopah Placers Co. has been churn-drilling some ground south of town, and may erect another dredge.

Cripple Creek.—The Portland company is dismantling the shaft-house at the Independence mine to allow of adding 30 ft. to the head-frame. A 5-ton automatic-dump skip is to be used. These improvements will enable a large quantity of ore being treated in the Independence mill.

The Big Toad M. & M. Co., leasing at the Dante mine, has re-modeled the Reid mill of 100 tons capacity, and is to start treatment of ore this month.

Leadville.—A concentration process for low-grade manganese is said to have been devised by C. E. Wuensch of the Yak company, who recently described it to a meeting of local men. For thorough testing he is asking them for assistance.

Ouray.—As is now well known, the Mountain Top company has a mill underground. At present, dumps on the surface are being taken into the mine, crushed, and treated by flotation. Twenty men are employed.

IDAHO

Mullan.—The Federal M. & S. Co.'s Morning mine has resumed work, after repairs to main shaft. This company's ore production is just half what it was a year ago, when it was nearly 12,000 tons per month. The report for the second quarter of 1918 shows a profit of $323,309, against $63,945 and $836,821 in the two previous periods.

Prichard.—Awaiting transportation from the railway here is a 4 by 4 by 50-ft. steel spud for the Yukon Gold Co.'s dredge on Prichard creek, near Murray. The spud weighs 20 tons, and is to replace a broken one on the boat. A caterpillar-tractor and trucks will be used to haul the structure.

MICHIGAN

Houghton.—The August output of ore from the Champion mine was 45,800 tons, from the Trimountain 16,000 tons, and from the Baltic 28,000 tons. These low figures are not to be wondered at considering the difficulty of securing men.

The only mine in the district that continues to show a steady increase in ore tonnage is the Isle Royale. The mine is furnishing all the ore that can be handled at its own mill, at Houghton, where three stamps are working three shifts, including Sundays. Last week the Isle Royale increased its shipments to the Point Hills plant—in which it owns a joint interest with other Calumet & Hecla subsidiaries—from 75 to 119 cars, so that the output for this month will be better than normal, all things being equal.

Calumet & Hecla and subsidiaries increased wages to all employees from 10 to 30% on October 1. The lowest wage underground is now $5 per day.

MISSOURI

Joplin.—It is estimated that there is 18,000 tons of zinc concentrate in reserve in the district, this not being thought excessive when all conditions are considered.

Production of the Tri-State region last week was 7184 tons of blende, 518 tons of calamine, and 1396 tons of lead. These averaged $53, $38, and $100 per ton, respectively. The total value was $543,690, of which Missouri contributed $130,626.

The Freehold Oil & Gas Co. has purchased two developed leases in the Waco-Lawton field, and will erect a 200-ton mill on each. W. S. Marquiss of Webb City is manager.

MONTANA

Butte.—Anaconda will pay $2 per share on November 25. This is equal to $4,622,500.

Clancy.—Re-timbering of the old 500-ft. shaft of the Legal Tender mine is under way. This was a former producer of high-grade silver ore.

The Amalgamated Silver Mines is mining and shipping high-grade silver ore from Free Coinage ground.

Corbin.—At the Alta mines old workings beneath Alta hill are being unwatered. A new transformer has replaced the Bertha plant, destroyed by lightning.

Philipsburg.—The Butte & Plutus company has acquired a half interest in the Jack Knife claims, near here. The Redemption claim has yielded manganese worth $80,000 during the past 18 months. The ore-bed carries from 19 to 40% Mn.

Saltese.—The Richmond M., M. & R. Co. pays a dividend of 1c. per share, $8400, on October 20. The last dividend was in November 1917. This copper mine gives promise of producing a good deal of high-grade ore.

NEVADA

Las Vegas.—The Las Vegas & Tonopah Railway, between Las Vegas and Beatty, is to be torn up, according to announcement of the Nevada Railroad Commission. The road was built to Beatty during the Goldfield boom. The company claims that the action of the U. S. Railroad Administration in routing all freight over the Tonopah & Tidewater railroad, which is 100 miles shorter, makes operation of its line unprofitable.

Luning.—Leading mine-owners of the Luning and Mina districts are to meet at Reno on October 10 to discuss the proposal to erect a smelter at one of the two centres. The ores carry copper, gold, and silver.

Manhattan.—The White Caps Mining Co.'s report for the year ended April 30, 1918, is considered disappointing. Sales of gold realized $110,254, while expenses totaled $269,111. These included $14,730 for apex litigation, $25,000 for depreciation, and $26,809 for administration. The

cost of mining and milling was $200,000. Current liabilities were $181,918, and assets $107,905, on April 30. The profit in May, June, and July, 1918, was $8371, $1339, and $6676, respectively. Monthly expenses are now $21,500. Regarding the mine, it is stated that while previous sampling gave an average of $20 per ton, the ore so far treated only averaged $13. As the orebodies consist of irregular chimneys in limestone, no estimate can be made of reserves; but they are continuous from surface to 550 ft., and show indications of persistence. The gold output in May was $30,352, in June $22,715, and in July $28,473. The quantity of ore treated in the period under review was apparently 8480 tons.

The White Caps company is levying an assessment of 3c. per share, equal to $48,000.

Tonopah.—Production of some of the mines in August was as under:

Mine	Tons	Silver, oz.	Gold, oz.	Profit
Belmont	8,413	99,864	1031	$50,812
Extension	9,027	105,679	974	37,176
Jim Butler	1,463	.....	....	29,813
Tonopah Mining	16,700	108,420	1047	38,335

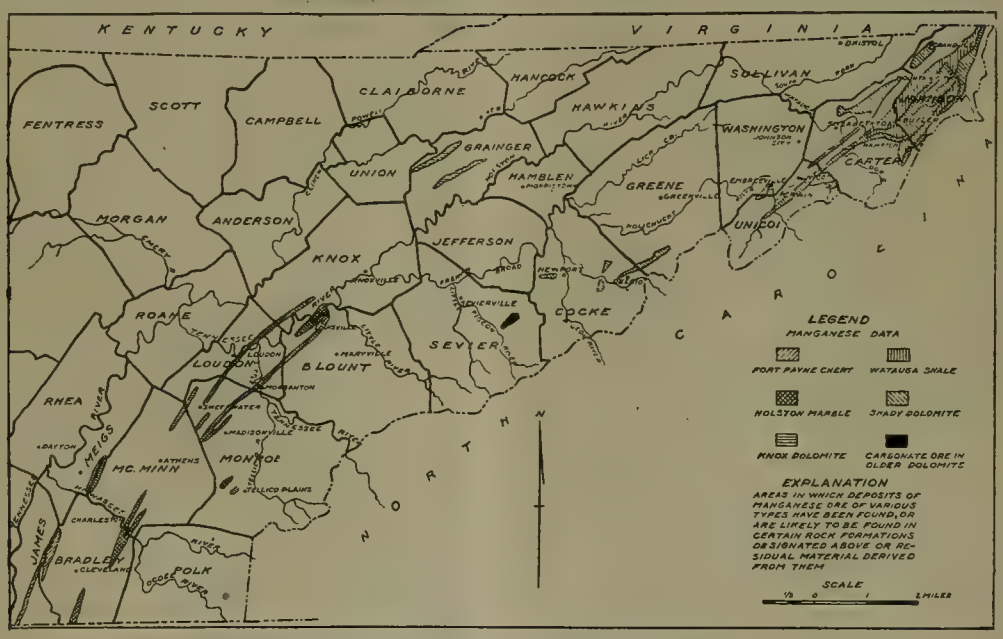
OKLAHOMA

Picher.—Production of the districts last week was 4741 tons of blende and 924 tons of lead, valued at $359,414.

The Premier mine here is an example of a good producer. In August, the mill working one shift daily, produced 385 tons of lead concentrate (about 80% metal), and 520 tons of zinc concentrate (about 60% metal). The total value was approximately $63,000. A. M. Gaines is manager.

TENNESSEE

Nashville.—In 'The Resources of Tennessee' for July, G. W. Stose and F. G. Schrader, of the U. S. Geological Survey, discuss the manganese deposits of eastern Tennessee. The report (Part I) covers 56 pages. The field work was done in co-operation with the State Geological Survey. The region examined is partly mountainous, partly lowland. Most of the known manganese deposits consist of heavy, black, hard minerals somewhat resembling iron ore in appearance and occurrence. They are frequently called black iron ore by farmers. The minerals are the oxides. They are found commonly in small masses in the soil and underlying clay, where they are discovered in plowing, in road cuts, or as float. Within the clay the ore is irregularly scattered as minute particles or the size of a bushel basket, occurring as botryoidal masses, or rounded nodules. The ore in the clay must be washed. Some of the masses are large enough to be mined as lump ore, and are shipped without washing. Other masses fill seams in sandstone and chert, necessitating crushing the rock and separating the ore by log-washer, etc. A list is given of the prospects and mines in the region, some of which are described.



EASTERN TENNESSEE, SHOWING MANGANESE DEPOSITS.

MEXICO

Chihuahua

Parral.—Confirmation of the reported destruction of two troop trains and a large steel bridge on the Parral and Durango railroad by Villa forces on September 16, was received at El Paso, Texas, on September 24. The trains left Parral on the morning of Independence Day, carrying 700 infantry, followed by cavalry supports. At San Jose, 60 kilometres from Parral, the steel bridge was dynamited and 10 of the 20 cars making up the two trains were burned. As nothing was said about casualties among the troops it is believed they had detrained for the mountains in pursuit of Villa. The damage to the railroad was $100,000. Rumors that Villa captured Parral September 20 were denied by messages from there on the 24th. His forces attempted to take Jimenez on that day, but failed. General Amaro arrived at Parral on the 20th with a cavalry column, marching from Durango. Americans at San Francisco del Oro, Durango, employed by the San Francisco mines of Mexico, a British corporation, were forced to leave for Parral on the 16th to escape Villa raiders. General Amaro is now in pursuit of the Villa band in the Parral-Jimenez district.

Doubling back on his trail Villa and 80 men entered and held Jimenez, Chihuahua, on Sunday, the 22nd, looting the town and killing 60 soldiers and civilians. Among those reported killed were all the members of the Gonzales family, against whom Villa had a grudge because he claimed they attempted to poison him two years ago. The body of a Mexican Central railroad official, who was killed in his house during the fighting, was brought to Juarez.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

W. Tovote is at Tucson.

Henry C. Perkins is here.

C. B. Lakenan was at Palo Alto this week.

William Sharp, of Goldfield, Nevada, has joined the Army.

J. M. Callow was in San Francisco during the early part of the week.

Archibald Burnett, recently at Swansea, Arizona, is in San Francisco.

L. F. S. Holland has been at Mexico City and is returning to Los Angeles.

Rene de Sallier has moved from Basin, Montana, to Watertown, New York.

R. Skewes Saunders, manager of the Dos Estrellas mine at El Oro, is in London.

H. Huntington Miller is at La Colorada, in Sonora, Mexico, on professional business.

W. D. O'Brien has gone to Washington, on his way to Bolivia on Government work.

L. N. V. Bullock is a Captain and a D.S.O. in the British contingent on the Italian front.

W. S. Lecky is doing good work as superintendent for the War Purchasing Commission of Canada.

T. A. Stiles, superintendent of construction at the U. V. X. smelter, near Verde, Arizona, is going to Oroya, Peru.

Ernest Lee Swift (formerly E. L. S. Wrampelmeier) has changed his name according to Court order September 16.

L. H. Goodwin, who is associated with the firm of Rogers, Mayer & Ball, New York, is examining mines in Nevada.

W. F. Smeeth sailed from San Francisco on September 24 on his way from London to the Mysore district of India.

Eugene Davis has been attending the convention of the American Bankers' Association and is now at New York.

P. M. Anderson sailed from San Francisco, on his return to Johannesburg, by way of Yokohama, on September 24.

Charles P. Perin, who has been acting as advisory engineer to the Tata Iron Works, in India, is returning to New York.

Arthur J. Bensusan, manager of the Passagem mine, in Brazil, is at New York, on a visit to American mining districts.

F. G. Cottrell, Chief Metallurgist to the U. S. Bureau of Mines, has gone to Los Angeles, on his way back to Washington.

Fred V. Berger, formerly at Treadwell, Alaska, is Major and Chief Quartermaster of the First U. S. Army Corps in France.

David McClure and **James W. Neill** have returned from an expedition to the Peace River country, in north-western Canada.

L. V. Cummins, who has been erecting a cyanide plant for Jacket-Crown Point-Belcher Mines Co. at Gold Hill, Nevada, is in San Francisco.

Leslie Bradford, metallurgist to the Broken Hill Proprietary Co., at Newcastle, N. S. W., sailed from San Francisco homeward on October 1.

David J. Kinzie, formerly in charge of the Treadwell employment bureau, is now Captain in the Adjutant-General's Department, at Camp Lewis.

Keith Roberts has received a commission as Ensign in the U. S. N. R. F. until he has completed a short course at Annapolis, when he will be given the same rank in the regular Navy.

R. S. Handy, mill superintendent for the Bunker Hill & Sullivan company, has received a commission as First Lieutenant in the Engineer Corps.

R. M. Jones, mining engineer of Goldfield, Nevada, has received a commission as Captain of Engineers and is now at Camp Humphreys, in Virginia.

Carlos W. Van Law has resigned as vice-president of the United States Smelting, Refining & Mining Co., and will resume general consulting practice.

Murray Innes, **H. W. Gould**, and **Clifford Dennis** will attend the quicksilver conference before the War Industries Board at Washington on October 23.

A. D. Hughes, manager of the dredging department of the Yukon Gold Co., has enlisted in the Engineering Corps of the Army. He is succeeded by **D. H. Perry**, of San Francisco.

John E. Orr, engineer to the Mount Morgan, in Australia, has been discharged from the British army after serving with distinction for three years and attaining the rank of Captain.

R. V. Mills, petroleum technologist of the U. S. Bureau of Mines, with headquarters in San Francisco, is at present in West Virginia where he will be engaged in Bureau work for several months.

Claude Ferguson has resigned as superintendent for the Copper Queen Gold Mining Co., at Stoddard, Arizona, to accept a similar position with the Consolidated Arizona Smelting Co., in charge of the operation of the De Soto and Swastika mines.

J. W. Moffet, manager of the Beaver mine, at Cobalt, Ontario, has resigned, owing to ill health. He is succeeded by **L. W. Ledyard**, who formerly managed the Teck-Hughes mine at Kirkland Lake.

T. Ernest Godson, Mining Commissioner for the Province of Ontario, and **J. Sutherland**, Chief Inspector of Mines for the same Province, are paying a visit to British Columbia for the purpose of making an investigation of Western mining conditions.

C. P. Bowie, petroleum engineer in charge of the U. S. Bureau of Mines petroleum station at San Francisco, has returned from a short trip to Colorado where he attended meetings held by the Bureau of Mines and also the meetings of the American Institute of Mining Engineers.

F. B. Tough, petroleum technologist of the U. S. Bureau of Mines, with headquarters in San Francisco, has returned to Illinois to continue co-operative work with the State officials and with the officials of the State University in the matter of cementing oil-wells in the southern fields of the State.

A. W. Ambrosé, acting chief petroleum technologist of the U. S. Bureau of Mines, is spending a few weeks in California on investigations in connection with the work of the Bureau. **C. H. Beal**, petroleum technologist of the Bureau, is taking Mr. Ambrose's place during his absence from Washington.

Francis Oats, chairman of the De Beers Consolidated Mines, died at Port Elisabeth, in South Africa, on September 1.

William Kent died on September 18, at the age of 67. He was editor of the 'American Manufacturer' for two years and of the 'Engineering News' for eight years. In 1895 he published his 'Mechanical Engineer's Pocket Book,' through which he obtained a wide reputation and an enduring name.

The American Institute of Mining Engineers will hold a meeting at Milwaukee, Wisconsin, during three days beginning October 8. Prominent members of the Institute of Metals division, and the Iron and Steel section of the Institute will be in attendance. The Milwaukee meeting will be held simultaneously with the annual meeting of the American Foundrymen's Association.

THE METAL MARKET

METAL PRICES

San Francisco, October 1

Aluminum-dust, large and small lots, cents per lb	65—70
Antimony (wholesale), cents per pound	16
Copper, electrolytic, cents per pound, in carload lots	26.00
Copper, electrolytic, cents per pound, in small quantities	27.35
Lead, pig, cents per pound	8.30—8.80
Platinum, Government price, per ounce	$105
Quicksilver, per flask of 75 lb	$120
Spelter, cents per pound	12
Zinc-dust, cents per pound	16

ORE PRICES

October 1

Antimony, 45% metal, f.o.b. California, per unit	$1.10
Chrome, 38 to 48%, California, per unit	$1.25—$1.50
Fluorspar, 85% CaF_2, f.o.b. shipping point, or San Francisco, per ton	$22—$30
Magnesite, crude, California, per ton (nominal price)	$7.00—8.00
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 45%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 85% MoS_2	$1.00
Pyrite, per unit of sulphur, cents	28—32
Tungsten, 60% WO_3, California, per unit	$20—$25

The chrome situation, according to Albert Burch, who has received information from the War Industries Board, gives every indication that the quantity of domestic ore produced during the remainder of 1918 can be sold at the first price prevailing during the summer months, and producers are instructed to wire the Board if they are unable to find a ready market. In wiring the Board, tonnage, price, and guaranteed analysis should be given. It is the present intention of the Board to arrange for continued chromite production in the United States for the first half of 1919 at a rate proportionate to 1918 production. The trade will be asked to purchase chromite produced in the United States during the first half of next year at this rate.

EASTERN METAL MARKET

(By wire from New York)

October 1.—Copper is unchanged. The scarcity of lead is unrelieved. Spelter is inactive and easier.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.35c., respectively, until August 15. On August 7 the current rates were again fixed until November 1, prices to be effective on the day of shipment, not the day of sale.

Quotations in cents per pound are as under:

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. This is to be continued until January 1, 1919, the price at point of delivery to be at East St. Louis plus freight. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government has fixed its maximum at 48.81 pence for metal 925 fine.

Exports of Canadian silver coin, silver bullion, and fine silver bars is prohibited except under license issued by the Dominion Minister of Finance. The regulations provide that licenses shall be issued only where the metal is to be used for essential civil or military purposes, and only where the exporter certifies that it has been purchased at a price that does not directly or indirectly exceed $1.01½ per fine ounce, at the point where the silver is refined or at the point of importation in the case of imported silver.

LEAD

Lead is quoted in cents per pound, New York delivery. Early in July, producers agreed to fix prices at 8.05c. per lb., New York.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefor $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds.

ORES (New York)

Molybdenum: The market is quoted at $1 per lb. with a fair inquiry reported.

Tungsten: An active market is reported for the high-grade ores, but there is not much being offered. The quotation for these ranges from $24.50 to $26 per unit, with the low-grade ores in good demand at $19 to $24 per unit. Italy is in the market for ore, which will probably have to be bought outside of this country. Ferro-tungsten is strong at about $2.25 to $2.50 per lb. of contained tungsten.

Eastern Metal Market

New York, September 25.

Little activity is in evidence in any of the markets, but the tone of most of them is strong.

The copper trade is turning its attention to the question of price changes after November 1, and it is expected this will be decided by October 15.

The future conduct of the tin trade is still a matter of mystery, particularly so far as importers are concerned. The prices are a little firmer.

Lead is scarce with distribution and prices under strict control.

Zinc has become quiet and prices are a little easier and lower.

Antimony is dull and slightly lower.

Fixed prices on iron and steel for the fourth quarter were announced yesterday, and they contained some surprises as to details, but not as to two features—an advance to merchant furnaces making foundry and basic pig-iron and no increase in finished steel prices. An advance of 50c. per ton was asked for Lake Superior iron ore, and 25c. was granted. Birmingham and Pittsburgh were adopted as basing-points for sales of pig-iron, with an advance of $1 per ton for basic and foundry irons. The Pittsburgh basing was limited to furnaces north of the Potomac river and east of the Alleghenies, thus relieving the pinch that has been felt by small furnaces in Virginia, and eastern Pennsylvania. A keen disappointment exists in the fact that the Class 3 steel companies, which buy basic iron in the open market, must now pay more for raw material and realize no advance in finished steel. The semi-steel projectile program of the next eight months calls for an output equaling and perhaps exceeding the present steel-shell production.

COPPER

Fundamentally copper is unchanged. Whether there are to be sufficient supplies of both crude and refined copper in the future is a matter of opinion among those not close to the actual facts. Apparently it all depends on the labor situation, which has been causing not a little anxiety. In some quarters there seems to be a better feeling as to the output of refined copper. One authority, eminently well posted statistically, made the statement that if labor conditions permit the electrolytic refineries to operate up to 70% of full capacity throughout the remainder of the year the outcome will be quite satisfactory. There are rumors that the price of copper will be advanced from 26c. after November 1, and as this date draws nearer it is probable that such rumors will increase. Some are quite confident that no upward change will be necessary. Imports of copper in June are given as only 11,000 gross tons, the smallest of any month this year. February holds the record at 27,000 tons, and January the smallest hitherto at 19,000 tons. For the six months ended with June the total for this year has been 122,500 tons against 135,000 tons in the same six months in 1917. August exports of copper are stated to be 18,829 tons, or the smallest this year. The price for jobbers selling five tons or less is 27.35c. per pound maximum.

TIN

The situation, so far as international control and prices of tin is concerned, continues as mystical as ever, on the side of the importers. The announcements from Washington recently stating that such control is to be an accomplished fact, give no details and leave much to be desired. One statement is to the effect that all "users and dealers" will be licensed, but nothing is said as to importers unless they are included among the dealers. Importers as a class do not yet know whether they are to be eliminated entirely or whether they are to be involved in the new machinery. If not, the question arises as to who is to conduct this rather complicated business after the War. Their elimination now may mean their introduction into other lines of business with no desire to return to it after the War. With this and other questions, and particularly price-control, still undecided, it is not surprising that buyers display no interest and refuse to take hold. The market has consequently been quiet, though late last week there developed some inquiry for far future shipment which resulted in business; the volume, however, was small. In view of the conditions this was to be expected until the dominant question should be settled. It is a fact, however, that there has been little buying for some time and this means a possible shortage of tin during the coming winter. Metal for future shipment from the East can be obtained for about 72c. per lb. Prompt tin is a little higher but nominal at 79c., New York. Arrivals at Pacific ports in September to the 19th, inclusive, have been 2620 tons, with those at Atlantic ports to September 14, inclusive, 1025 tons. The London market is lower, with spot Straits quoted yesterday at £340 10s. per ton, against £343 per ton a week ago.

LEAD

The entire market is in the hands of the Lead Producers' Committee. Even most inquiries are being turned over direct to the committee by producers as they come in. The question of labor continues to dominate the present and the future as to the supplies of lead. There is not enough metal now, and all demands are being carefully scrutinized as to their essential character, for the committee is really trying to make a few tons suffice for many. The agreed prices continue at 7.75c. per lb., St. Louis, or 8.05c. per lb. for carload and larger lots, with less than carloads held at 8.55 cents.

ZINC

The week has been a quiet one and the demand has receded to small proportions. Most producers are well sold up for some time and consumers are also apparently pretty well covered. There are occasional inquiries for small lots for all positions, which are resulting in some sales. Quotations during the week have steadily but moderately declined until yesterday prime Western for early delivery, September-October, was regarded as largely nominal at 9.30c., St. Louis, or 9.65c., New York, with last quarter at about 9 to 9.10c., St. Louis, or 9.35 to 9.45c., New York. The Government's weekly report of production and stocks show a decline in output for the week of only 37 tons. There has also been a decline in stocks of 1978 tons with Grade D credited with 1005 tons of this decline. Grade A zinc has a maximum Government price of 12c. per lb., but sales have been made frequently below this.

For sheet-zinc the fixed maximum price is 15c. per lb., and for plate-zinc 14 cents.

ANTIMONY

The market is quite dull and inactive, with the quotation slightly less at 13.87½c., New York, duty paid for wholesale lots for early delivery.

ALUMINUM

There is no change in Government prices, which continue as a maximum for No. 1 virgin metal, 98 to 99% pure, and for scrap at 33c. per lb. for 50-ton lots, at 33.10c. per lb. for 15 to 50-ton lots, and at 33.20c. per lb. for 1 to 15-ton lots.

INFORMATION FURNISHED BY MANUFACTURERS

GRAPHITE AS A LUBRICANT

A microscope shows all metal surfaces to be irregular. The surfaces look like a nutmeg grater. Flake-graphite attaches itself to the high-spots, filling in depressions and forming over the whole surface a thin tough film, unctuous to the highest degree, thereby preventing metal-to-metal contact and substituting the low frictional contact of graphite-to-graphite for the high frictional contact of metal-to-metal. Dixon's flake graphite is unaffected by high temperatures, cannot be carbonized or ignited, cannot possibly give off explosive vapors, will not accumulate dust or grit, does not clog discharge-valves, improves frictional surfaces, prevents metallic contact, reduces the amount of oil or grease, reduces friction, prevents shut-downs, and saves power and fuel. Graphite as a lubricant is not a competitor of greases or oils. On the contrary, the two in most cases go hand-in-hand. Dixon's flake-graphite improves all oils and greases, the oils acting as a carrier to properly distribute the graphite. There are some cases where graphite is not recommended as a lubricant, particularly if the lubricant must be a non-conductor of electricity, as graphite is a good conductor, and, vice versa, there are some conditions when graphite works best alone. The proper use of Dixon's flake-graphite will reduce the cost of cylinder-lubrication at least 50%. A mixture of graphite permanently suspended in oil has no particular advantage over a non-graphited oil as a lubricating material, because the particles of graphite, being in perfect suspension, cannot break through the surrounding film of oil, or easily become attached to the metal surfaces. They simply move about in the oil-film without decreasing the viscosity of the oil itself, the only way in which any reduction could be brought about. In fact, a mixture of finely divided graphite and oil has a higher viscosity than that of oil alone, and so the reduction of friction is not to be sought along this line.

COMMERCIAL PARAGRAPHS

The Pelton Water Wheel Co. has reprinted for general distribution as a circular, the interesting article on 'Improvements in Water-Wheel Efficiency,' recently contributed by E. C. Hutchinson to the 'Journal of Electricity'. It is illustrated by many views of water-wheel installations, some consisting of 5000-hp. units. One of these is further illustrated by sectional drawings. There are also many curves showing daily average load, and efficiencies obtained. In conclusion Mr. Hutchinson says:

"Generally speaking, the impulse or tangential water-wheel has a much flatter efficiency curve characteristic than the reaction-turbine; yet great economy has been effected under certain conditions by the replacement of some impulse-wheels with reaction-turbines, which will deliver a higher efficiency at a point of continuous load output. On the other hand, there have also been instances where, because of the great variation of load and the much better fractional-load efficiencies to be obtained by impulse water-wheels of the multiple-runner, duplex-nozzle type, replacements of reaction-turbines have been effected in a field which, under ordinary conditions, would appear to lie altogether beyond the proper bounds of impulse or tangential water-wheel construction. Furthermore, a considerable improvement in power-output has been obtained by installing turbines of the modern reaction-type to replace turbines of the older and earlier forms of design. Under present conditions, however, there is no question that the water-wheel installations of the impulse or tangential type offer the best opportunity for increased power-output, with the least additional expense to the purchaser, as most forms of turbine-construction do not permit of modification by the substitution or replacement of detail parts for the purpose of increasing efficiency and power-output from the same amount of water. The result is that most turbine improvements are made by installing complete new units."

The Westinghouse Electric & Mfg. Co. is distributing catalogue 1-B, dealing with wiring-devices and carbon circuit-breakers. This is a 224-page, 8½ by 11, catalogue listing fuses, knife-switches, service-switches and boxes, solderless connectors, disconnecting switches, instrument switches, safety switches, safety-panel boards, safety floor-boxes, and carbon circuit-breakers, part of which have previously been listed in the old sectional 3001 catalogue of the Westinghouse company. An entirely new and complete line of knife-switches of the Westinghouse company's own manufacture, both front and rear-connected, the types A and C, are described in 49 pages of this catalogue. A new line of disconnecting switches, known as types P and R, are included in this catalogue for the first time. In listing the carbon circuit-breakers, the Westinghouse company has made a departure from previous practice; they are listed according to what they will accomplish, that is, according to the method of operation, method of mounting, and capacity, the type designation being the secondary consideration in the table of listings. On looking up the circuit-breaker to accomplish a particular duty, all that is necessary is to find from the index the particular table listing the breakers according to the operation and method of mounting desired, and then, in that table, follow down the list until the number of poles, the ampere, and the voltage-capacity are found. A type designation is shown with this so that those wishing to know the details of construction of the breaker which will give the required operating characteristics, can easily find them on the pages of description.

E. P. Dillon, manager of power division of the New York office of the Westinghouse Electric & Mfg. Co., has resigned to become general manager of the **Research Corporation of New York.** Mr. Dillon came to the Westinghouse company in 1909, having been previously connected with various mining and electrical companies in Colorado. In 1917 he was transferred to the New York office as manager of the railway and power divisions. For several years he was assistant to the manager of the Railway & Lighting Department at East Pittsburgh, being in charge of power-house and apparatus work.

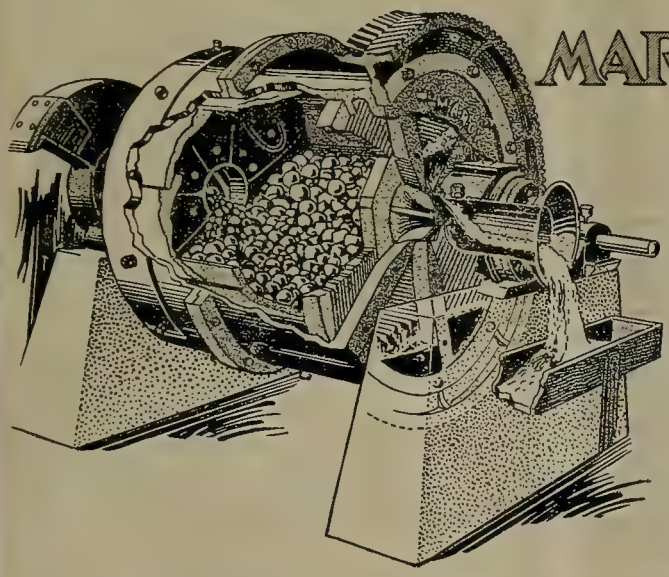
MARCY MILL — CLASSIFIER — WILFLEY TABLES

A Complete Concentrating Plant



MARCY BALL MILL

The efficiency of the Marcy Mill has been established in scores of plants under most severe conditions.

The Marcy takes a crusher product and, in ONE EASY STEP, reduces it to treatment size. The Marcy Mill is built in six sizes. Capacities range from 4 tons to 1000 tons daily.

WILFLEY TABLE

The story of the Wilfley Table is the history of concentration. It was the **first** successful table and is still the **best.**

The Wilfley handles the most complex concentrating ores, not only yielding the best extraction but also handling maximum tonnages.

Twenty thousand Wilfleys are in operation. Investigate it for your problem.

Write for the Latest Wilfley and Marcy Booklets

They show an efficient concentrating plant may consist only of a Marcy Mill, Classifier, and a Wilfley Table. Write for copies today, giving character and tonnage of your ore. There is no obligation involved.

NOTES 471

THE 'LUSITANIA' TEST 472

Lapse of judgment by the New York 'Times' in suggesting that we meet the Central Powers in a peace conference; avalanche of letters protesting against it; offer of $5000 for these letters by the 'Manufacturers Record'; delinquencies also by Henry Villard in the 'Evening Post' and 'The Nation'; unpatriotic utterances by the Hearst papers. M. & S. P., October 12, 1918.

THE PEACE OFFENSIVE 473

A "manœuvre to gain the moral initiative"; impudence of Prince Maximilian in 'offering' peace to the Allies; Germans merely trying to escape punishment for their sins; seeking an exit from their deadly dilemma; internal evidence of moral unregeneracy in the Chancellor's address to the Reichstag. M. & S. P., October 12, 1918.

FINANCIERS ENDORSE THE GOLD PROPAGANDA. 474

The sound-money program of the gold-miners winning Eastern advocates of a policy of Governmental relief to the industry; endorsement by the 'Wall Street Journal'; editorial favoring a bounty in the 'Commercial and Financial Chronicle'. M. & S. P., October 12, 1918.

SPANISH METALS FOR THE ALLIES 474

The Peñarroya mines of Spain have produced lead and silver continuously for the Allies; have paid large dividends to French owners; Spanish government has not been obstructive. M. & S. P., October 12, 1918.

ARTICLES

ENCOURAGING GOLD PRODUCTION 475

Views of a leading financial editor; endorses the action of the American Bankers' Association in urging Federal aid for gold mining; shows why we need more gold; favors paying a bounty; points out that gold-production has never represented a net profit to the nation producing it. M. & S. P., October 12, 1918.

SALVAGING METAL FROM EUROPEAN BATTLEFIELDS 476

M. & S. P., October 12, 1918.

GOLD-SECURED CURRENCY FOR CHINA 476

M. & S. P., October 12, 1918.

THE UTAH COPPER ENTERPRISE—II. HISTORY

By T. A. Rickard 477

Entrance of Capt. Joseph R. DeLamar into the negotiations; his relations with Col. Wall; examination and tests by Hartwig A. Cohen for DeLamar; discouraging influence on the enterprise at that time from low-priced copper; Victor Clement takes a hand, and D. C. Jackling is entrusted with the mill-testing; co-operation of R. C. Gemmell; analysis of Mr. Jackling's report; complicated financial negotiations; MacNeill and Penrose send F. H. Minard to report; organization of Utah Copper Co. in 1903; Mr. Jackling's forcefulness in developing the enterprise; friction between Jackling and Wall. M. & S. P., October 12, 1918.

PRODUCTION OF QUICKSILVER 488

M. & S. P., October 12, 1918.

PROCESS FOR RECOVERING PLATINUM

By V. J. Zachert 489

Difficulty of saving platinum; hard to determine correctly the true proportion in sands; method of collecting platinum, both for testing and practical recovery; use of copper sulphate and zinc-amalgam for this purpose. M. & S. P., October 12, 1918.

CARBOCOAL 490

M. & S. P., October 12, 1918.

COLLOIDS IN FLOTATION

By Jackson A. Pearce 491

Apparatus devised on the theory that the froth carrying colloidal matter will rise above the froth carrying granular mineral, and thereby may be separated by discharge at two levels. M. & S. P., October 12, 1918.

INVESTED CAPITAL 493

M. & S. P., October 12, 1918.

CHARCOAL AS A PRECIPITANT OF GOLD 494

Tests by W. R. Feldtmann, extending the work of H. R. Edmands, showing that precipitating-effect grows with proportion of colloidal charcoal present; also that the precipitation is excellent with aurous cyanide but poor with auric cyanide. M. & S. P., October 12, 1918.

SEPARATING BARIUM FROM STRONTIUM

By John Waddell 495

Method based on volumetric determination of the precipitated barium chromate, using a standard solution of sodium thiosulphate. M. & S. P., October 12, 1918.

Established May 24, 1860, as The Scientific Press; name changed October 20 of the same year to Mining and Scientific Press.

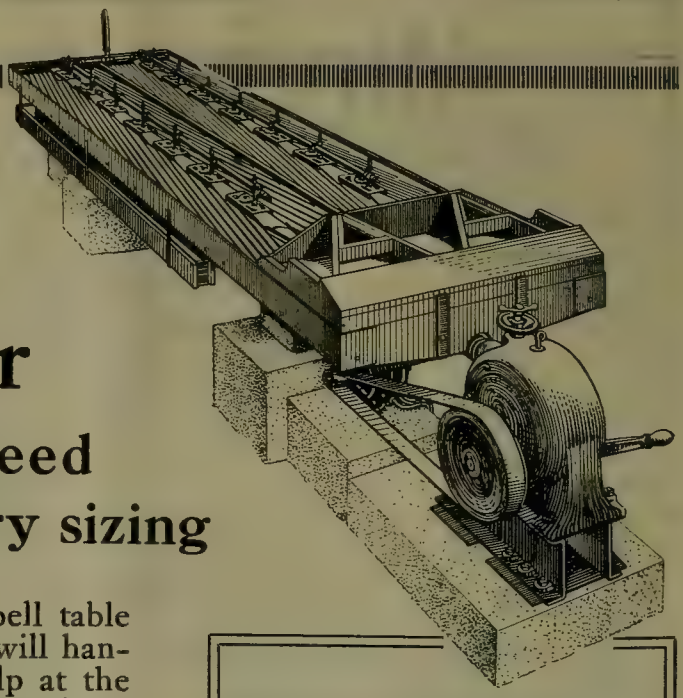
Entered at the San Francisco post-office as second-class matter. Cable address: Pertusola.

Branch Offices—Chicago, 600 Fisher Bdg.; New York, 3514 Woolworth Bdg.; London, 724 Salisbury House, E.C.

Price, 15 cents per copy. Annual subscription, payable in advance: United States and Mexico, $4; Canada, $5; other countries in postal union, 25s. or $6.

The Isbell Concentrator

treats a mixed feed without preliminary sizing



This *special feature* of the Isbell table puts it in a class by itself. It will handle coarse, fine and slime pulp at the same time—and there is no need for expensive classification apparatus.

This has been proven over and over again both in tests and under actual working conditions.

At the mill of the Tungsten Mines Company, Bishop, California, Isbell tables are taking feed direct from roll screens—10 mesh, and producing a 68% to 70% WO_3 concentrate—and 70% to 72% recovery.

A recent test on Chrome ore, proved absolutely that the Isbell table would handle an unclassified feed and make an exceptionally high recovery.

Write us for details as to what the Isbell table can do for you. Send us a sample of your ore and we will test it.

Send for our descriptive bulletin today.

Collins & Webb, Inc.

Manufacturing Engineers and Machinery Dealers

412 E. 3rd St. Los Angeles, Cal.

Motors	**Mills**	**Tables**
Generators	**Crushers**	**Hoists**
Engines	**Rolls**	**Filters**

Note these salient Isbell features

A deep bed of pulp—undisturbed by cross wash-water. A series of hydraulic cut-outs through which the concentrate is drawn off **from the bottom**—as soon as formed.

The riffles—running longitudinally only—guiding the concentrate **in** toward the cut-outs.

The concentrate launders—one on each side—below the deck—concentrates can be readily examined and sampled.

The compact, self-contained head motion—no dust, sand or water can enter the working parts, which run in a bath of oil. No screw adjustments other than the stroke, which can be varied from ¼ to 1 inch by turning the hand wheel while the deck is in motion—main shaft mounted on Timken Bearings, automatically oiled. Deck mounted on universal sliding bearings running in oil.

High class, careful construction distinguishes the Isbell throughout.

YOUR subscriptions to this issue of Liberty Bonds will pay for the victories that you are cheering.

THAT peace-explosive from Berlin is a 'dud'; it will do no execution, except at home.

PLATINUM is much in demand for use in the chemical laboratories that are preparing materials necessary in war. Mr. V. J. Zachert has invented a means of saving platinum and shows his patriotic spirit by not patenting it but by describing his process in this issue, so that it can be used for the Nation's good.

FORTY miners are reported to have struck at the Victor mine, near Tonopah, until three of their fellow-workers, who had refused to buy Liberty bonds, saw the error of their ways. We never heard of a strike being used to better purpose nor do we recall a better proof of the solidarity of Labor in support of the National purpose.

THIS is Columbus day, the anniversary of the discovery of America, 426 years ago; it is one of the days when the Kaiser discovered that Americans were not cannon-fodder; it is the day on which three years ago Nurse Cavell was murdered by the invaders of Belgium; it is Liberty Bond day. Celebrate it in the one logical manner: Buy bonds to bring the War to a victorious conclusion.

WE are amused to see that our New York contemporary has opened its columns to the commercial controversy between the manufacturers of ball-mills, a discussion that we are doing our best to exclude even from our advertising pages. The representatives of these manufacturers have likewise burdened the proceedings of the Institute with a lot of stuff that proves nothing because it is of the 'write-up' character, like the recommendation that Tommy brought from his mother—interesting to the family, but unconvincing to his neighbors.

CARBOCOAL is a new product obtained by distilling coal at a moderate temperature. The material has little resemblance to coke; it ignites more readily, supposedly because of the occlusion of an extraordinary amount of oxygen; and it is easy to pulverize. Fuel-gas and the usual by-products that are recoverable in the retort-coking of coal are equally available when making carbocoal. It is not improbable that it may prove useful in connection with reverberatory smelting. The gas could be utilized in conjunction with the pulverized carbocoal, which information at hand indicates might offer advantages over ordinary pulverized coal.

CHARCOAL has long been known as a precipitant for gold. It was employed early in the application of the cyanide process in California, and has always tempted the metallurgist. The contribution to this subject, by Mr. W. R. Feldtmann, which we reproduce this week, shows that the precipitating effect increases with the fineness of the charcoal, and he attributes this to the colloidal condition produced by extreme pulverization. That no doubt is correct, but it does not explain the reaction. That the carbon does its work best in this active state, in which its adsorptive powers are so conspicuous, taken in conjunction with the further fact that the reaction proceeds best with the aurous salt, should lead to further discussion by metallurgical chemists.

LEST we forget, let it be recorded that the Germans have sunk more hospital-ships than military transports, and that when they assassinated the women and children on the 'Lusitania' they struck a medal to celebrate the event and proclaimed a holiday for the schoolchildren of Germany that they might applaud the cowardly deed. Now the American soldiers go over the top shouting 'Lusitania,' and the day has come when the Hun is finding no trench or fortress strong enough to protect him from the avengers. He is unrepentant, although he begins to whine about defending his land from those that are driving him back to his lair, after invading, marauding, and despoiling the hearths and homes of millions of innocent people in Belgium and France. When the beast has been caged, it will be time enough to talk about pardoning his sin; until then it is sanctimonious blasphemy.

NEWS from the front usually fails to be pictorial, because the scope of action is so large and the newspaper correspondent is rarely placed so as to make accurate observations. However, occasionally a pen-picture is transmitted over the wire. Here is one that we rescued from a mass of confused writing a few days ago. We

give it in abstract. The main assault was launched at dawn under cover of a creeping curtain of shell-fire. An American division advanced shouting 'Lusitania.' With them went a squadron of tanks. While this attack was progressing favorably, a British division on the left swam the canal and pushed forward, in the face of steady machine-gun fire, to the village of Belleglise. By nine o'clock prisoners were being sent to the rear in droves. A pause followed this first phase of the battle. The Americans, tired but elated, stood in the trenches they had captured, while the Australians, moving to their support, passed over them, or 'leap-frogged,' to form the first wave of a renewed advance. The storm of cheering that greeted this manœuvre rose high above the din of battle. . . . Those cheers will find an echo round the world wherever a common language and a common ideal unite the English-speaking peoples.

THE annual Exposition of Chemical Industries has become an event of national importance. The fourth has just been held in New York, with a large representation of exhibitors and a greater throng of visitors than ever. America is developing as a manufacturer of chemicals on a scale such as to ensure us the leading position among the nations, and the expositions held under the auspices of the American Chemical Society are performing a great service in promoting this development. The work of the metallurgist is inextricably interwoven with that of the chemist, and the utilization of by-products is leading the smelters to expand their field of operations so that plants devoted primarily to the reduction of copper, lead, and zinc are becoming complicated with a train of subsidiary chemical industries. Therefore, it is not suprising to find a long list of metallurgical companies among those represented at the Chemical Exposition, including such concerns as the Anaconda Copper Mining Company, the New Jersey Zinc Company, the Nichols Copper Company, and dozens more. The features relating more definitely to the metal industries will be reported in our correspondence department.

PRODUCERS of zinc in the Komspelter region of Kansas, Oklahoma, and Missouri have been complaining that they do not receive a fair price for their product, the market for the zinc concentrate failing to keep step with the quotation for spelter. It is proposed, therefore, to erect concrete warehouses and to store the concentrate therein, with the idea of forcing the smelting companies to go into the open market and pay higher prices. Warehouses, for this purpose, are being built at Picher and Douthat in Oklahoma, and it is said that others are to be built in the neighboring mining districts. The Oklahoma Mining Exchange of Miami is backing the scheme, and the Oklahoma Ore Producers' Association of Picher is asking for the co-operation of the mine-owners in the entire Komspelter region. We await eventualities. It seems likely that if the scheme should be carried out, and a large tonnage of concentrate be stored, the menace to the market will outweigh the benefit of controlling the supply. The ancient law of supply and demand is stubborn. Our friends in the zinc industry are running their heads against a brick wall. We note also a full-page announcement, in the 'Joplin News Herald,' that the mining men of Joplin consider, not without reason, that they have been "betrayed by the Democratic party" because zinc has been imported in large quantities from Mexico, Australia, and Spain. The statistics they themselves publish show that the big importation was in 1916 when the total was 385,964 tons, whereas in 1917 only 211,000 tons was imported, and during the first half of 1918 only 39,718 tons. So "vote for the Republicans and restore the tariff," shout our friends at Joplin. That seems natural, for the big importation was made before we entered the War. However, this is not a time for party politics. Damn the Kaiser, gentlemen, if you must let off steam, not the Government. We cannot afford to mix political parties with Uncle Sam just now.

The 'Lusitania' Test

Supporters of decent journalism have been surprised and disappointed by the sudden lapse of the 'New York Times' when on September 15 that paper published a nerveless editorial advising the Government to meet the representatives of Germany and Austria in a peace conference. The suggestion was denounced instantly in letters from thousands of the 'Times' readers, but none of these was published, the editor of the 'Times' contenting himself with a brief and lame retraction ten days later. This was an irretrievable blunder. The 'Times' ought to have published a selected number of the denunciatory letters and omitted the retraction, which was unconvincing, as is suggested by the 'Manufacturers' Record,' which has offered the 'Times' $5000 for the letters and telegrams sent in protestation, it being the belief of our excellent contemporary at Baltimore that the publication of the correspondence would be read eagerly by the American public. With this we agree heartily. It is a thousand pities that the 'Times' should have besmirched its own record by such an error of judgment, for the leading paper of New York has done great service for the Allied cause since August 1914 and in other respects has held the premier place among the newspapers of the world. Another periodical that has gone wrong, in a sense deeper than the blunder just discussed, is the 'Nation.' The issue of September 14 was detained by the Post Office for an improper article criticizing the mission of Mr. Gompers abroad. We are not surprised that the editor of the 'Nation' has come under the ban, for his talk while at the University of California last March was offensive to all good Americans. His father was Henry Villard, whose real name was Hilgard; he himself was born in Germany, and while here he talked a lot of watery nonsense about internationalism. In such cases the best test is that of the 'Lusitania.' Any man that approved of that assassination is either a moral pervert or a pro-German, or both. On May 10, 1915, this same Mr. Villard wrote, over his own signature in the

New York 'Evening Post,' which he then controlled, as follows: "Had the submarine given thirty minutes' warning to the crew and passengers of the Cunarder, the exploit would have gone down in history as one of the most brilliant in the annals of naval warfare." What would his maternal grandfather, William Lloyd Garrison, have said to that! Moreover, what would Edwin Lawrence Godkin, who made the 'Evening Post' a great newspaper, have thought to see such a stupidly evil statement over the signature of his successor! The 'Nation' and the 'Post' have held a high position in the American journalism of the past, so it is to be hoped that Mr. Villard's connection with the 'Nation' will soon end, as it has already with the 'Evening Post.' It is fitting to revert to Hearst in this connection, for he also gave himself away in a signed editorial on the 'Lusitania' horror. On June 6, 1915, in the 'American' he wrote: "Whether it [the 'Lusitania'] was armed or not, it was properly a spoil of war, subject to attack and destruction under the accepted rules of so-called civilized warfare." We would like to see that statement recorded on a tablet at the Greek theatre, which Hearst gave to the University of California, and, ill content with a small acknowledgment not too prominently placed, insisted on a large entablature advertising the fact that the theatre was "A Gift from William Randolph Hearst." That advertising sign on the front of a classic replica is like a trading-stamp on the forehead of a fair woman. It should be deleted, and replaced by Hearst's dictum on German piracy, just to remind the youth of California that the Hearst money has debauched the journalism of San Francisco and befouled the fame of the University itself.

The Peace Offensive

A "manœuvre to gain the moral initiative" describes the proposal made by the new German Chancellor. That is the phrase used by Mr. Frank H. Simonds in discussing the recent Austrian proposal, and it fits the German sequelæ. By the time these pages reach our readers the President will have replied curtly and incisively to the insulting 'offer of peace' from the Kaiser's parliamentary puppet as he did to that of the Austrian emperor. He will, we trust, reiterate his refusal to "bargain or compromise with the government of the Central empires . . . because they are without honor and do not intend justice." We feel confident that the Allies will stand firmly on the assertion that no conference for peace, least of all an armistice, can be granted so long as a single invader remains on the soil of France, Belgium, Italy, Serbia, or Russia, so long as a single marauder has his hands on the spoil he has seized in disregard of the law of nations. This German move is as much a part of their campaign against us as were the offensives that they launched in the spring; having failed in their military attacks they now fall back on a diplomatic ruse to gain time and restore their badly battered morale. The sword, which drips with the blood of innocent women and children, of non-combatants and of hospital patients, is held in one hand while the pen, of the perjurer and brigand, is flourished in the other. The ruse is too palpable. We know the Enemy by this time and we shall be damned to all eternity if we close our eyes to our knowledge of his sinister insincerity. When the German says peace he means an arrangement for escaping the logical consequence of his attempt to hold civilization by the throat; when he talks of compromise he is like the burglar caught in the act with his hands on the silver attempting to cajole the indignant householder; when the Kaiser speaks of an "honorable" peace he means an *advantageous* escape from a deadly dilemma. It was fortunate that the German ruler issued his proclamation so soon after his Chancellor's pronouncement, for by doing so he made clear the meaning of the move. Almost before Prince Maximilian had finished his speech, in which he laid stress on the representative character of the Reichstag and emphasized his desire to express "the will of the people," his imperial master had issued a proclamation, ignoring both the Chancellor and the Reichstag, and personally assuring the German people that *he* would only extend *his* hand for "an honorable peace." Note also what the Chancellor said. "The program [of these German negotiations with the Allies] will not permit the peace treaties hitherto concluded to be a hindrance to the conclusion of a general peace." Indeed! Then the solemnization of treaties with Ukrania, Russia, and Rumania was merely the joke of the War-lord, and the be-ribboned documents were to be treated like that other 'scrap of paper,' for which the world is exacting plenary damages. Again, after explaining a few changes in the relation of the ministry to the Reichstag, and suggestions for extension of the franchise restricted to the separate kingdoms, duchies, and other members of the German federation, which in no wise trim the claws of military autocracy, he assumes that the outer world is not sufficiently instructed concerning the political institutions of his country to comprehend the shallowness of the proposed reform; so he hopes to make it seem that Germany has complied with the democratic prescription written by Dr. Woodrow Wilson, and once more reveals the duplicity inherent in every Teutonic utterance, in the following words: "The striking force that the Government has in its striving for peace depends on whether it has behind it the united, firm, and unshakable will of the people. Only when our enemies feel that the German people stand united back of their chosen leaders—then only can words become deeds." In other words, they are pretending a democratic form of government in order to persuade the Allies to negotiate with them. The fact is plain that the Germans, having failed in their criminal scheme to dominate the world by ruthlessness and terror, are becoming anxious to avoid the utter defeat that stares them in the face. So they want to bargain, in the hope of staying the advance of the avenging armies of the defenders of human liberty. They think to impair the Allied morale as they did with their peace offensive in December 1916. But, thank God, it is too late for them to hope to succeed, for the morale of the Allies has been

strengthened to steel by the aid of the American armies, which are moving forward with the heroic spirit and deadly effectiveness that express the whole-hearted support of a united people. We intend to see this thing through; there can be no pact with an outlaw. The Enemy is unrepentant; he merely tries to evade the penalty of his failure. He must evacuate the territory he has invaded, restore the property he has stolen, pay for the damage he has done, and surrender for trial the criminals that caused this calamitous war.

Financiers Endorse the Gold Propaganda

The conservatism and sound economic sense of the gold-producers have borne splendid fruit. There were those that prophesied failure, that doubted whether any good thing could come—we do not say out of Reno, but out of a convention of gold-miners, who might be suspected of mingling selfishness with patriotism. Naturally the two attributes become confused, but that does not involve the hoggishness of the profiteer. Even a patriot if he is to live must have goods, and to get goods he must continue to make money. The gold-miner merely asked for the privilege of remaining in existence; he said so at Reno, and again at Spokane; he also declared his respect for our present monetary basis, and renounced any intention of tampering with the standards of finance, even if he were forced out of business for standing by his sound-money principles. The Eastern financial journals published the Reno resolutions with scarcely concealed surprise; they had heard that the gold-miners wanted to raise the price of gold, and here came their definite statement that they neither wanted nor expected any such thing. All they wanted was relief, and they left it to the wisdom of the Administration and of Congress to construct a feasible plan, aided by the suggestions that they themselves might offer. This declaration for sound money attracted wide attention and won sympathy among the financiers and bankers of the country. It constituted one of the strong arguments that persuaded the American Bankers' Association to go on record so emphatically in favor of granting assistance to the gold-producers. Next we find the 'Wall Street Journal' supporting the proposal and presenting figures to show the need; and now the scholarly 'Commercial and Financial Chronicle', in a ringing editorial, has pronounced for Federal aid to increase our supply of gold. We reproduce this thoughtful statement on another page of this issue. The editor of that paper demolishes the objections to a bounty by the gentle reminder that "It is probable, if failures to find it [the gold in the earth] were counted, it never did pay a comparative cost of production in any country, not excepting the fabulously rich sands of Alaska"; and he goes to the heart of the matter when he says, "It is amount we want, and may need. The standard will take care of itself; we would not change it if we could, and could not if we would. Yes, we could—with the result of tumbling credits over the whole world like a house of cards, and spreading commercial ruin more disastrous than the physical destruction of 'the greatest war in history'." The East is convinced; the sound financiers are the friends of the sound-money gold-producers. They can henceforth work together, and they will be able to save the country from the calamity of having the stream of new gold for our Treasury dried at its source.

Spanish Metals for the Allies

It is a pleasure to record the operations of a great mining and metallurgical company, the Peñarroya, that has worked loyally in Spain for the good of the Allies throughout the War, and that, in doing so, has prospered without let or hindrance by the Spanish goverment. We know that the German propaganda in the Peninsula has been intense, so that all Spain has been divided, not as Gaul into three parts, but into two camps, the Aliadófilos, and the Germanófilos, so that even the restaurants, in order to save their crockery from being used as ammunition in the valient defence of these predilections, had to post notices prohibiting all discussion of the War. It is the common people in Spain that have yielded chiefly to the Teutonic influence, which may be explained by the extraordinary development of the doctrines of socialism and anarchism in that country. In the socialists the Germans found a ready pseudo-philosophic sympathy; in the anarchists a torch that might be useful, as a last resort, if, as they feared, the Allies should succeed in forcing Spain to co-operate actively with them. Fortunately for the world, the socialists and the anarchists in Spain hate and distrust each other as cordially as both hate the rich and the titled aristocracy. There has, consequently, been no co-ordination of the Teutonic propagandists in Spain, and while the demagogues have made pandering speeches that have stirred the bull-rings with as much enthusiasm, especially on the side of the bleachers, as if a matador had made a classic sword-thrust, the ministry, whether headed by Dato, Maura, or Romanones, has gone on its equivocal way, but actually never taking steps to interfere vitally with a sort of neutrality that has proved in the end benevolent to the Allies. The English mining companies can corroborate that; their shipments of copper and pyrite have not been halted. Administrative difficulties there have been, at times, but appeal over the head of the local official has brought governmental relief. Neither have the profits been absorbed by crushing taxes. As concrete evidence of this is the summary of the report of the great Peñarroya Mining & Metallurgical Company appearing on another page. It is a French corporation, one of the largest producers of lead in Europe, operating famous mines in the south of Spain, and, after shipping 170,000 tons of refined lead, 1873 tons of spelter, and nearly eight million ounces of silver, to France and England, it has been permitted to distribute to its shareholders in France the sum of $2,350,000, earned in 1917, which represents 16% on the common stock. That speaks with sufficient emphasis in answer to those trouble-makers who have been endeavoring to create hard-feeling between us and Spain.

Encouraging Gold Production

*It is a very interesting and important matter that is brought to public attention by the recent conferences of gold producers, and which received consideration at this week's meeting of the American Bankers' Association. The inevitable scramble for gold after the War is a vital, if not a threatening, problem of the future. There need be no alarm over a possible recurrence of agitation in favor of bimetalism. The 'standard of value' was never more firmly fixed in the world than it is today. All this vast indebtedness of war is payable in terms of gold—and any other form of payment will constitute plain repudiation. As to the suggestion of a return to the 'double standard', silver may have an enhanced market value, due to increased use because of war's circumstances affecting certain countries, but that market value of silver is measured in terms of gold, and any attempt to re-monetize it at war-prices would present again the old uncertainty of a shifting scale. Twenty-five or thirty million Government bondholders in the United States, and a similar number in other commercial countries, will hardly desire to take payment in silver, instead of gold as provided, only to find that precious metal dwindle in their hands. A dead delusion is hard to revive. The standard of value is not dependent for its effectiveness as a standard on the amount of gold in the world. Gold at a premium would not destroy the measuring value of a standard fixed by world-wide commercial experience and sanction.

But we do need more gold, and every nation needs more gold. Why? Well, here is one illustrative answer—for the same physical reason, in charatcer, not in kind or extent, that we need more yard-sticks to measure ten million bolts of cloth than ten thousand. Gold does not 'circulate'. It is not adapted to this—paper based on gold dollar for dollar is better—there is no abrasion and loss. Gold is used to pay balances. When credits have reduced themselves by cancellation to mere remainders, there must be something to pay the differences in, something that does not change, and it is by consent of common use, gold. By its world-adoption this gold as a standard of value, though recognized by governments as a legal tender for convenience of the people, is really independent of legal-tender qualities which can never operate beyond national boundaries. Gold pays the debt anywhere and everywhere—commerce says so—and commerce is wider and longer than political governments. Coinage values disappear, and a given commercial value, a standard, appears when we cross from country to country. All moneys decreed by governments translate into the denomination-weight of that coinage which has the most widespread recognition, by virtue of extent of commerce, in the marts of the world. At present it is probably the American gold dollar. Out of this translation grows international exchange—now muddled by war. If we had a complete effective system of international exchange, an international clearing house acting in the cancellation of indebtedness as our Federal Reserve or city clearing agencies do, we would not need any more gold, the world would not need more than exists now. Colossal war credits increase the number and volume of remainders, international banking machinery breaks down, hence, more gold to settle remainders. At present we are not settling—we are issuing more credits, increasing the need against the days of reconstruction.

There are 23.2 grains of pure gold in a dollar coin; $20.6718 in an ounce. Before the War there were grains enough, ounces enough, for the world's needs. Bars were shipped in preference to coin. Weight, grains, and ounces, paid any debt, because no debtor refused, and remainders were certainties—the 'standard' was physically as well as theoretically sufficient for commerce, trade. Now that electrically charged barbed wires, great guns, submarines, and bombing airplanes divide the nations, the translating process, international exchange, breaks down, while the basis of settlements, the volume of debts, increases to almost inestimable proportions, and, as we have said, the settlements, final, are not made, they await the resumption of trade, the offsets between nations as well as individuals. These are to come, and with them an attempted renewal of trade on a grand scale, causing, if it comes, increased remainders. But no matter what comes, the standard is secure—the grains in a dollar—and the corresponding computed grains in every other coinage. You may put the English pound in place of the dollar if you choose—an unchanged standard of value.

Therefore, we need more gold. Every nation does. Some of them will buy it, if they can. Some may order (legal-tender) their subjects to take payment in other metals, and internally fix a price thereon, and thus repudiate debts. The 'standard' will stand, nevertheless. Mark—the history of the world is being written in gold, as well as blood. We do not specially need more gold now. We already have more than our share, some think more than is good for us. That is a fallacy—and it should not be forgotten that we are steadily adding to our debt based on gold. But we may need more gold—when the War is over and democracy opens the gates of trade over the seven seas. An ounce of precaution is also worth a pound of cure. If it is a good monetary and financial policy to sequestrate all our gold in the vaults of the Federal Reserve Board and banks, where it will be hard to get when we mayhap shall need it to pay commercial balances incident to our assumed coming domi-

*Editorial in 'The Commercial and Financial Chronicle', New York, Sept. 28, 1918.

nance in world-trade (gold does not rigidly follow the balance of trade as between two peoples or nations), then it would be good policy to get more now, if we can. It is here, in mountains and valleys, but hard to find. It is probable, if failures to find it were counted, it never did pay a comparative cost of production in any country, not excepting the fabulously rich sands of Alaska. It is a very simple proposition, that, with new processes alone making possible the utilization of low-grade ores, and with labor soaring in wages all the time, the cost of production now will diminish the amount of production. It is amount we want, and may need. The standard will take care of itself. We would not change it if we could, and could not if we would. Yes we could—with the result of tumbling credits over the whole world down like a house of cards, and spreading commercial ruin more disastrous than the physical destruction of 'the greatest war in history.' But that is inconceivable folly. Why, then, is there not a duty incumbent here to study the question of how to increase the output of gold?

Meanwhile, our great banks are establishing branches in foreign countries. If all nations would do the same, not only would world-trade be facilitated, but the need for volume-of-gold would be diminished. Some day, perhaps, we will have a perfect international system of interrelated banks, with an international clearing house for all, and then we will have attained true economy in the use of gold. A perfect democracy will tend to ensure this —but it has not yet come. Dangers are often imaginary, and panics come from imaginary causes on occasions. At all events, why not encourage gold production, as a mere precaution, while we are encouraging everything else from fixed double prices on wheat to a spoonful of sugar a meal for saving. It is an open question. But gold will be a live question when the dynasties are dead and autocracies no more forever.

Salvaging Metal From European Battlefields

Europe's battlefields have been showered with steel and iron and brass from shells, exploded and unexploded, and from hand grenades. Much of this metal will be removed as a necessary preliminary to the resumption of peaceful pursuits. The quantity of metal is so great that it would be a source of annoyance, and even of danger to the tiller of the soil. A systematic sweeping, so to speak, of all the bombarded regions will be necessary. A French engineering journal describes an apparatus which, though created for this special purpose, can be applied to other uses, for it will indicate the presence of steel and iron not too deeply buried in the soil. This, however, is a slow way to proceed where long-continued bombardment has literally filled the soil with metallic fragments. Methods of salvaging are contemplated that involve passing the soil through plants for recovering the metal, and returning the soil to its place, levelled and ready for tillage. It is also pointed out that the concentration of fixed nitrogen in these battlefield-soils, resulting from the enormous quantities of explosives used, will make these areas exceptionally fertile.

Gold-Secured Currency for China

Tsao-Julin, Chinese Minister of Finance, in his recent petition to the President of the Republic, states that in February 1914, the Government promulgated a coinage law, the object of which was to unify the silver currency as a preliminary to the adoption of the gold standard. He shows that China would suffer great loss in exchange if silver should fall in price, and if it should rise it would disturb the appropriations in conformity with the budget. Since the outbreak of the War in Europe, China has made large gold loans to the Allies, so that she is now suffering greatly on exchange, and in the event that gold should return to its normal value-level, China would pay dearly again for what she has borrowed, thus suffering double losses. The fluctuation of exchange between gold and silver long has been a serious handicap, causing incalculable losses in Chinese commerce, and making the development of Chinese industries impossible. This makes the immediate adoption of the gold standard imperative.

China has but little gold. It is difficult to mint gold coins at once. It is also difficult to fix the ratio between gold and silver owing to abnormal conditions created by the European war. So it is necessary to have a transitional program. Liang Chi-chao's program is: (1) Strictly to enforce the National Coinage Law of 1914 to secure unification of silver currencies. (2) To clear up paper-currency entanglements to secure a sound note-issue. Then to issue gold-notes as a preliminary step to the adoption of the gold standard. Liang also approached the Quadruple Group of Banks for a currency loan to carry out his program. The Group represented by the Yokohama Bank advanced Y10,000,000 during Liang's tenure as Finance Minister, another Y10,000,000 during Wang Ko-ming's time, and another Y10,000,000 during the encumbency of Tsao-Julin.

The conclusion arrived at is that three steps should be carried out: (1) Unify silver currencies; (2) adjust the note issues; (3) issue gold-notes. The gold-note issue, as preliminary to a gold-standard, was suggested by Dr. Vissering in 1912, and is similar to Liang Chi-chao's idea, which is to fix the new unit, to be called the Chin-yuan, or gold yuan, containing 0.752318 gramme of pure gold. The gold-notes will be issued by banks designated by the Government, and empowered to raise the necessary capital for establishing a trading company to conduct international business. The gold-notes are to be exchangeable at specified banks for foreign gold coins or for 'string-gold.' The banks of issue are to maintain a fixed gold-reserve, subject to periodical official verification. There shall be no restriction upon the size of the secured issue of notes, and such currency is to be legal tender. A Currency Bureau is created, members to hold office 10 years, having a Director General in conjunction with the Minister of Finance, a Governor, and a special Advisor.

The Utah Copper Enterprise—II

History (Continued)

By T. A. RICKARD

Enter Capt. Joseph R. De Lamar. This actor has played a part in mining romance all the way from the Sangre de Cristo mountains to Lake Nipissing. He has been known to give the comic touch to the heavy performance of *la haute juiverie* at New York and to render foolish the antics of their super-expert. The Captain is a remarkable man, and he has had a picturesque career. He was born at Amsterdam 75 years ago. He has been a diver; he has commanded merchant-ships between New York and the Bermudas; thus his captaincy is of the sea. He has bought prospects and developed mines in Georgia, Colorado, Idaho, Nevada, Utah, and California. His name is on the postal map. I am told that he is a hard worker; a man of keen judgment, capable of quick shrewd decisions; possessing the rare faculty of looking ahead. Capt. De Lamar has proved himself alert and enterprising; he is an adventurer, using the term in its old sense of one willing to venture, as the Cornish used to speak of the shareholders in a mining enterprise and as the proprietors of the Hudson's Bay Company are still called officially: "the adventurers trading in the Hudson's Bay territory." Had the Captain lived in the spacious times of Great Elizabeth he would have harried the Spanish main, chased the heavily-laden galleons, and taken tribute of the *conquistadores*. In short, Capt. De Lamar is a notable figure in American mining.

De Lamar had known Colonel Wall at Mercur, for, among other dealings, he had bought from him the Brickyard mine in 1894. At that time the Captain's chief of staff, or manager, was Hartwig A. Cohen, now in San Francisco. In 1895 Cohen came to examine Wall's copper prospects; he took a few samples* and made some hand-tests, by panning, the result being a favorable opinion. De Lamar obtained a six-month option on three-quarters of the property at $375,000. A test was made on 76 tons of ore in a small stamp-mill, called the Markham, in the lower part of the town of Bingham. This ore came from the Mackintosh tunnel, then about 300 ft. long, and from two other similar prospecting drifts. The test yielded a concentrate containing 28 to 33% copper, on an ore assaying 2%, the recovery being 60 to 62%.

No business ensued. De Lamar thought the recovery discouraging and the ore too poor; moreover he was intimidated by the weakness of the copper market, which, near the close of 1895, suffered from disturbed financial conditions, the quotation for electrolytic copper falling to 9¾ cents per pound, as against 12 cents a few months earlier.

Three years later, in 1898, De Lamar, probably encouraged by the rise in copper, which was quoted at 12 to 12½c., in the summer of that year, again asked for an option, in order to make further tests and investigations. He obtained an option on a quarter-interest at $50,000 and on a second quarter at $250,000. A preliminary sampling was undertaken by Robert C. Gemmell (Univ. of Michigan, '84), at that time engineer for De Lamar at his Golden Gate mine, at Mercur. Oxidized copper ore was exposed wherever the rock was not hidden by vegetation. On the east side there was more brush than on the west side of the gulch. Some tests were made in a 5-stamp mill, called the Rogers, below the mine, by Daniel C. Jackling (Missouri S. of M. '92), who also was a member of De Lamar's staff, being then metallurgist at the Golden Gate mill. Everybody seemed pleased with the investigation, including De Lamar himself, but that astute financier told Wall that he would like an extension of time in order to do some exploratory work in the mine, and that he was prepared to undertake it if he could acquire a larger interest. Wall replied that he would sell three-quarters of the property for $750,000 cash. That ended the negotiations.

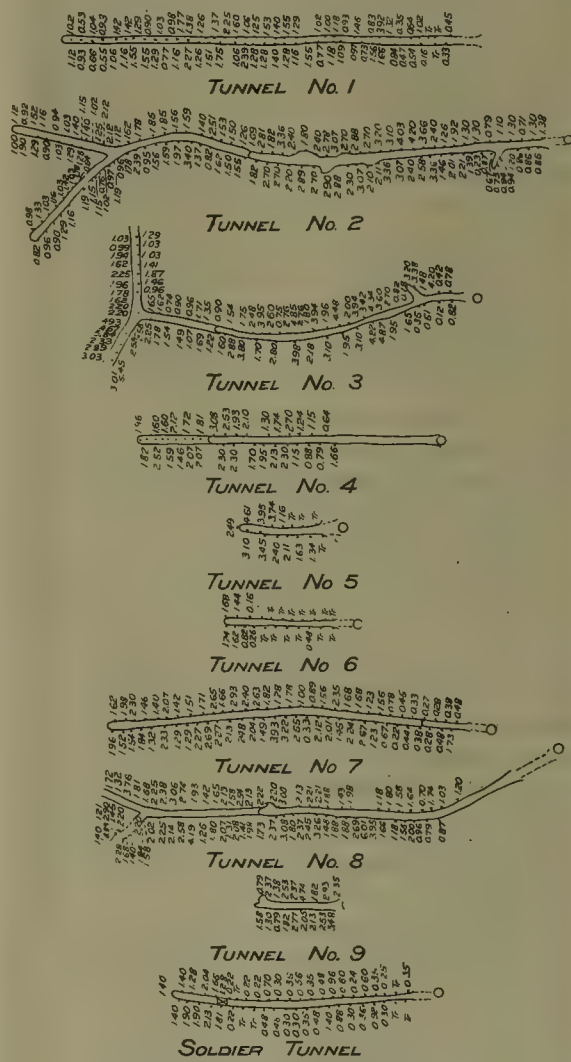
Shortly afterward, at the end of 1898, De Lamar and Cohen had a disagreement, the immediate consequence being that Cohen resigned as manager for De Lamar, his place being given to Victor Clement, on a salary of $36,000 per annum and an eighth interest in anything he found, that is, in any new mining venture introduced by him to the Captain. Clement had returned in 1896 from Johannesburg, where he had been manager of the Simmer & Jack mine, controlled by the Consolidated Gold Fields of South Africa, Ltd. He had met Wall, and a friendly acquaintance had developed. From Gemmell and Jackling he heard about the Wall property; thereupon, early in 1899, he told Wall that he had been going over Cohen's figures and thought he saw the making of a successful venture; he informed Wall that he himself would participate in any business that might result with De Lamar and he could guarantee a square deal. Clement took Gemmell with him to Bingham, and they went over the ground. The result was an offer, by Clement, for De Lamar, to purchase a quarter for $50,000 outright, with a year's option on another quarter at

*Which, he tells me, he assayed by the volumetric cyanide method in a little house on the dump of the Mackintosh tunnel.

$250,000, and on a third quarter at $1,250,000. This proposal was accepted. It was Clement's intention to prove the property and then sell the third quarter through his financial friends in London, thereby obtaining the money needed to build a mill and a railroad from the mine to the mill. During the year of the option De Lamar had the right to test and explore. Clement put James Mason in charge of the mining work and spent $25,000 in extending the drifts and in driving new crosscuts, all of which were carefully sampled by Gemmell. The mill-tests were placed in charge of Jackling, who repaired the old Rogers mill, in the gulch just below the Ohio Copper mine and conveniently near the Wall property. The mill was equipped with a 5-stamp battery, two Wilfley tables, and a vanner. Henry M. Crowther acted as superintendent. The mill-tests served to check the sampling of the workings by Gemmell, and to determine the amenability of the ore to ordinary concentration. I am glad to be able to quote from the report made by Jackling at that time.

This report, dated September 18, 1899, is addressed to Cohen as manager for De Lamar; it is extremely interesting when read in the light of later developments. The report was the result of collaboration between Messrs. Jackling and Gemmell, the latter writing the portions that bore upon the development of the mine, the probabilities of further discovery, the character of the orebody, and the average value of the ore as determined by sampling. I take pleasure in reproducing the map of the principal workings, with the results of the sampling as done by Mr. Gemmell at that time. The assay-figures were written on the original map at the points where the samples were taken, but they would have been illegible when the map was reduced to the size of one of our pages, so I give them separately in another column, with the outlines of the various tunnels, rendering identification easy.

In his report, Mr. Jackling describes the ore-bearing rock as "a very silicious fine-grained porphyry," which has been so fractured naturally that when blasted the ore breaks into small fragments. Where Bingham canyon cuts this porphyry the width of ore is 3000 ft. "The copper occurs in the form of grains of very pure chalcopyrite quite uniformly distributed throughout the mass, there being very little iron pyrites, or other base sulphides of any kind associated with it. Near the surface the oxidizing action has been such that the larger percentage of copper has been converted into carbonates, and, to a certain extent, silicates, and in most cases the copper thus oxidized has been, to a very great extent, leached out of the rock, leaving the values practically nothing on the surface, but increasing rapidly with depth, both as to value and percentage of copper present as sulphides." Thus he recognizes the effects of secondary enrichment. He states that only the tunnels numbered 1 to 9 and the Soldier tunnel have been considered in calculating the amount of ore developed, "no attention" being paid "to shallow surface workings or to incline-shafts sunk on small veins." Evidently, for the sake of simplicity, the workings that were used in making these calculations were numbered from 1 to 9, inclusive, and were so shown on the map accompanying the report. In order to correlate this numbering with the workings shown on the original sampling-map, as reproduced herewith (Fig. 1), it is necessary to say that the order of enumeration from 1 to 9 was Tunnel 1, Tunnel 12, Quinn tunnel, Tunnel 2, Tunnel E, Tunnel 6, Tunnel 15, Tunnel C, Tunnel D, and Soldier Tunnel.



ASSAY-PLANS OF THE PRINCIPAL WORKINGS

(See map on opposite page)

Samples from raises in these tunnels were used in arriving at an average, but the results from the churn-drill holes were questioned, and therefore were not used. Samples were taken at intervals of 10 ft. on each side, alternating, so that the workings were really sampled every 5 ft. The samples were reduced and quartered in the usual way. Mr. Gemmell tells me that notes were made as to whether the samples represented oxidized or sulphide ore, the assays of the oxidized ore being used in

calculating the average value of the 'cap' and the assays of the sulphide samples for calculating ore. The original blue-print, from which the accompanying map was copied, shows a number of shallow surface workings, such as pits, open-cuts, short drifts, and the like. Generally these surficial diggings had been made at particularly favorable spots, often where the gash-veins of richer oxidized ore had been detected; therefore, the assays of samples from these shallow workings were discarded. Assays of ore from the two tunnels called 9 and 10 on the blue-print were ignored, because these tunnels were not on the Wall property. The total length of workings on the Wall property, including the 2520 ft. done during the terms of De Lamar's option, amounted to 5770 ft. The report states that in estimating the average grade of the concentrating ore 461 samples were used, and as these samples were taken every 5 ft., as explained, they would represent an aggregate length of workings equal to 2305 ft. About 40 ft. of surficial rock (consisting of soil, detritus, and leached porphyry) would have to be stripped and dumped to one side, says Mr. Jackling. He takes 300 ft. as the average length of ore proved by the tunnels, and 200 ft. as the average maximum depth of ore. The length, as exposed in the tunnels on both sides of the canyon, is 2000 ft., "and it is assumed that the ore will be quarried to a plane level with the gulch." Thus he indicates the method of mining he has in view. From the dimensions given, he estimates 167,200,000 cubic feet, which, at 13½ cu. ft. per ton, is equivalent to 12,385,000 tons of ore. This assumes "an equally developed orebody on either side of the canyon". The average assay is 2% copper, as determined from 461 samples broken in the ten principal tunnels, omitting the 40 ft. of stripping. The mine-sampling is confirmed by the mill-tests. In conclusion, Mr. Jackling says that "an estimate of 25,000,000 tons, in addition to that already developed, is conservative as a probability of further production. This estimate is based upon a supposed width, at the northerly end of the property, of 600 ft., at the southerly end 1000 ft., at the middle 2400 ft., with a length of about 3000 ft., and a depth of about 110 feet." All these expectations have been more than confirmed by mining operations. His synopsis is as follows:

Ore at present developed	12,385,000 tons	
Average assay value	2% copper	
Average thickness of waste to be stripped	40 feet	
Average thickness of orebody developed	110 feet	
Estimated cost of stripping waste, per cubic yard	75 cents	
Estimated cost of mining ore, per ton	40 cents	
Estimated cost of hauling ore to mill, per ton	15 cents	
Estimated cost of concentration, per ton (on 2000 tons per day basis)	45 cents	
Estimated total cost of mining and concentration, per ton	$1.14	
Saving made by concentration on 2% ore	75%	
Estimated cost of smelting and refining concentrates:		
Per ton of concentrates	$11.39	
Per ton of raw copper	0.71	
Profits per ton of raw ore (price of Lake copper, 18 cents per pound)	2.83	
Actual cost of producing one pound of copper	0.06	
Profit per month, on basis of 2000 tons daily capacity, taking price of Lake copper at 14 cents	$90,000	
Profit per month at present price of copper (18 cents per pound)	162,000	
Estimated cost of mine equipment		$21,600
Estimated cost of railroad and equipment		232,000
Estimated cost of concentrator		356,000
Estimated cost of smelter and refinery		223,000
Estimated cost of steam-power plant		170,000
Estimated cost of shops, etc.		20,000
Total		$1,022,600

It will be noted that the actual cost of producing copper is estimated at 6 cents per pound. In this estimate no charge is made for interest on the investment, only ordinary repairs on the equipment being considered. Including depreciation and interest on investment, the cost is estimated at about 7 cents per pound. The appraisal of the mine is based on an average price of 14 cents for Lake copper, which at that time was the standard and was worth nearly a cent per pound more than electrolytic copper.

In describing the tests made in the Rogers mill, Mr. Jackling states that the equipment consisted of five 650-lb. stamps, two Wilfley tables, and a 6-ft. vanner, the last, however, "was scarcely used at all, as the belt was not in good shape, and it was impossible, with the appliances at hand, to separate the slimes and take them direct to the vanner without using such an excess of water that the work of the machine was worthless." The ore was classified roughly in a hydraulic sizing-box, the coarser material going to one Wilfley table and the remainder, with a large excess of water, to the other table. The mill-tests may be summarized:

Weight of sample lb.	Crushing mesh	Assay Heading %	Assay Tailing %	Assay Concentrate %	Recovery %
418,800	20	1.42	0.43	22.16	58.0
258,400	25	2.04	0.51	23.69	76.5
68,200	30	1.70	0.45	20.98	103.4
149,000	30	1.84	0.34	22.85	97.7
151,600	25	1.37	0.42	16.15	58.9
191,400	25	1.08	0.32	18.95	67.36

The last two tests were made on dump ore, partly leached. It will be noted that the better results were obtained by finer crushing. Discrepancies between recoveries calculated from the differences between the heading and the tailing and between the heading and concentrate produced are due, says Mr. Jackling, "to carelessness in handling concentrates and allowing them to become mixed, and, in this way, weighed and credited to the wrong test." This applies particularly to the third test. The summary of results is given as follows:

Total dry weight of ore milled	574.82 tons
Average assay-value in copper	$1.55
Total dry concentrate	29.339 tons
Average assay of concentrate	21.75%
Recovery, by assay of ore and concentrate	71.70%
Concentration	19.59 into 1

The actual returns from the sale of the concentrate to the Germania smelter, near Salt Lake City, showed 57,000 lb., containing 54,601 lb. net dry weight, assaying 22.10% copper, 0.12 oz. gold, and 1.40 oz. silver; the contents therefore being 12,067 lb. of copper, with 3.27 oz. gold, and 38.22 oz. silver per ton. Payment was made on 94% of the copper at $2.50 per unit, or 12½c. per pound, making $1419.60. All the gold was paid for at $19 per oz., making $62.24. On the silver 95% was paid at 59½c. per oz., making $21.56. Thus the total valuation at the smelter was $1503.40, equivalent to $55.07 per ton of concentrate. From this a smelting charge of $7.98 was deducted, leaving $47.09 net per ton of concentrate, or $1.94 per ton of crude ore. Mr. Jackling estimated the total cost of mining at 54 cents, of haulage to the mill at 15 cents, and of concentrating at 45 cents, making a total of $1.14 per ton. He assumed a recovery of 75% on a 20% ore and a ratio of concentration of 16:1. The cost of roasting, smelting, and refining he estimated at $11.73 per ton of concentrate. This concentrate would yield 451 lb. copper, 1.26 oz. silver, and 0.114 oz. gold, making an aggregate value of $75.26, as against a total cost of $29.97, leaving a gain of $45.29 per ton of concentrate or $2.83 per ton of ore milled.

While this examination was in hand, Clement got into a wrangle with De Lamar over his one-eighth interest, the Captain claiming that the Wall business had been introduced by Cohen, of his own staff, while Clement insisted that the Captain's staff had turned it down and that he himself had initiated the later negotiations, which had proved fruitful. Clement resigned and Cohen came back. Again the Captain dropped the deal, save for the quarter he had bought at $50,000. He had also spent $46,000 in the course of the examination, exploration, and testing. It is likely that his quarrel with Clement was one reason for abandoning the option; another being a not unreasonable timidity at tackling a mining venture based on such low-grade ore and requiring so much capital to place it on its feet. Clement might have helped to dispose of an interest on advantageous terms in London, but that possibility was spoiled by his resignation.

In 1901 Clement went to Mexico; so did Gemmell. From Mexico, Clement wrote to Wall occasionally, assuring him of his continued interest in the mine at Bingham. He had an idea of persuading Volney Williamson of Spokane to join him and Wall in developing the big prospect. Meanwhile De Lamar retained the quarter interest that he had bought for $50,000 in 1899, and it was necessary to get him out. Thereupon Wall told Clement that if he would buy out De Lamar for $100,000, he would sell a quarter to Clement for $50,000, provided the property was incorporated and sufficient capital raised for development and equipment. De Lamar's quarter-interest worried Wall; it spoiled his sleep. He obtained an option on it for 90 days at $100,000, but nothing came of that. An injunction obtained by Clement forbade delivery by the bank. Clement died at Saltillo, in Mexico, on April 26, 1903. I record the fact regretfully even 15 years after.

Now comes another turn of events. Mr. Jackling had taken part in the tests made for De Lamar on the 'porphyry' ore in 1898 and 1899; he had written the report that summarized the results of those tests and of the accompanying examination of the mine itself. At that time, however, he was junior to Cohen and Clement. He was then only 30 years of age, but he had already proved himself a capable and resourceful metallurgical engineer, and he had repeatedly advised De Lamar that the Bingham venture was full of promise. A masterful character, possessed of strong initiative, starting life poor and without friends, but a graduate of the Missouri School of Mines, he was beginning to feel his way to his natural position as a captain of industry. He realized that to turn Wall's prospect into a profitable mine it would be necessary to spend much money, at least $3,000,000; and in those days, before any of the low-grade 'porphyry properties' had been proved a basis for successful exploitation on a big scale, it was almost impossible to engage the attention of capitalists in such a venture.

Before proceeding with my history, I will give instances to corroborate this last statement. My friend James W. Neill, now in the far North-West of Canada, told me the following story a few months ago: "One day, in 1897, Colonel Wall came to my office at Salt Lake City and said to me: 'Jim, I have a copper mine,' and I said 'Colonel, where is it, and how big is it?' He said, 'It's in Bingham, and it's a mile wide and as long as a railroad, and it's got more copper in it than the Anaconda had at surface.' I said, 'Colonel, that's easy; the Anaconda had no copper at the surface.' Later Col. Wall gave me an option on his three-fourths interest in his claim, the chief of which were the Dick Mackintosh and Charles Read, and I also had an option on the entire holdings of what is now the Ohio Copper Co., then the Cook group. I offered these holdings to Benjamin Guggenheim, in New York. He referred me to his engineer, Hermann A. Keller. The answer that I got to my representations that there was a mass of ore there, as shown by the tunnel on the Dick Mackintosh claim, which ran 2¾% copper, was that the tailing from the Parrot mill, at Butte, which had been under Keller's charge, ran as much in copper, and he couldn't see where he could make any money on that class of ore; so, naturally enough, my proposition was not attractive."

Mr. Cohen tells me that he submitted the business to

the late Benjamin Guggenheim in 1900 and to Charles A. Coffin, of the General Electric Co. in 1902, with his own report stating that the mine showed 18 million tons of 1.6% ore, concentratable in the ratio of 15:1. In 1903 he presented the deal to John Hays Hammond, shortly before Messrs. Penrose and MacNeill took hold. In the same year L. C. Trent had an option and offered it to the Tharsis Sulphur & Copper Co., of Glasgow, Scotland. Colonel Wall tells me that an engineer named Wilson examined the property for Marcus Daly in 1901, and that Joseph Clark visited Bingham in 1902, becoming so favorably impressed as to ask if he might submit the project to his brother, Senator W. A. Clark; but nothing happened. The fact that a mass of 1½ to 2% copper ore was unattractive 15 to 20 years ago should surprise no one; it required constructive imagination of no common order and unusual financial courage to undertake the large-scale exploitation of such a deposit at that time.

To return to our story: Soon after the last examination of Wall's property, in the summer of 1899, Mr. Jackling resigned from Capt. De Lamar's employ and went to Republic, in Washington, where he designed and built a mill for Clarence McCuaig and other Canadian capitalists. In 1901 he went to Colorado Springs and became associated again with Charles M. MacNeill and his other former employers, now his friends, as consulting engineer to the United States Reduction & Refining Co. At the very start of his career, at Cripple Creek in 1894, he had made the acquaintance of MacNeill and also of Spencer Penrose and Charles L. Tutt, these three being the organizers of the U. S. Reduction & Refining Co., which operated two big mills at Colorado City, close to Colorado Springs, on ore coming from the mines at Cripple Creek. For this company Jackling re-built and managed the Bartlett zinc-pigment plant at Canon City in 1902. Meanwhile he had not forgotten the Wall property at Bingham. He spoke about it to his friends in Colorado and they undertook to back him; so, at the close of 1902, just before Christmas, while at Salt Lake City on other business, he called upon Colonel Wall and asked him for an option, but without success. It happened that both Jackling and Cohen were in Salt Lake City in connection with a suit brought by De Lamar over the interpretation of an electric-power contract made during the time when they were in the Captain's employ; so they met. Jackling discussed the Wall property with Cohen and stated to him that if he could persuade Wall to grant an option he (Jackling) could get his Colorado associates to provide the capital necessary to develop the enterprise. Cohen went to Wall and spoke of having New York friends that would be willing to find money for the Bingham property if Wall would give a reasonable option. Wall was willing to sell half of his holdings for $400,000, but he imposed conditions covering the equipment and development of the mine; and he demanded that a mill to treat 500 tons daily be built by the supposed New York buyers, who also were first to purchase De Lamar's quarter. The negotiations broke down until Cohen obtained the help of the Salt Lake banker, William S. McCornick, who aided Cohen in persuading Wall to come to terms. The result was that on January 23, 1903, Wall signed an option to Cohen on "two-fourths undivided interest" at $350,000 in cash, of which $50,000 was payable on March 9 and $300,000 on June 7 of that year. In this agreement Wall recorded his willingness to join in the organization of a stock company, retaining the right to nominate one member of the governing board. Cohen took the option to Jackling, who took it to MacNeill, in Colorado. Thereupon MacNeill, Spencer Penrose, and his brother R. A. F. Penrose, came with Jackling to Utah and visited Bingham. Cohen's agreement was replaced by a new one, in the name of Spencer Penrose. By the terms of this new deal Wall was to receive $385,000 for 55% of the entire property and the MacNeill-Penrose group was to buy De Lamar's quarter, leaving Wall with a 20% holding in both shares and bonds. The option was for six months, with the privilege of an extension for twelve months more on payment of $5000 in cash for each monthly extension of time. They did use seven months extra and for that they paid $35,000, so that Wall eventually received $420,000 in all. They bought De Lamar's quarter for $125,000.

R. A. F. Penrose selected F. H. Minard to examine the mine. Mr. Minard's report is dated April 23, 1903. It is of particular interest to me because in 1899 he was my assistant in the examination of the Camp Bird mine, another famous bonanza. Mr. Minard brushes aside the non-essential geologic features, and places his finger on the dominant fact that the 'porphyry' has intruded into the limestone and quartzite, and that "with the exceptions noted on the north and east, the entire property is in the porphyry, and it is this formation which carries the copper." He says: "Copper occurs in this porphyritic formation in small particles of iron and copper pyrites which are very finely disseminated through its entire mass." He states that Bingham canyon has been cut, by erosion, through this copper-bearing intrusive mass, so that exploratory work, by means of tunnels aggregating 2500 to 3000 ft. in length, has afforded facilities for sampling. His samples were taken with hammer and moil, at intervals of 10 ft. "Each section was stripped and cleaned of all loose rock and copper stains, and the sample taken of the hard fresh rock, avoiding all seams or veins of ore. The cuts were made up both sides of the tunnel and across the top, and each sample weighed 50 pounds, and some of them heavier. These samples were all sacked and sealed immediately after taking; they were then dried and broken to the size of almonds and quartered twice, then broken to the size of small peas and quartered, making duplicate samples, one of which was sent to Colorado City, and the other to Canon City for analysis." Mr. Jackling was stationed at Canon City, Colorado, at that time. The assay-plan showed a zonal occurrence of the copper, as also did the two previous samplings of the property. "All the maps," he says, "show that there is a distance of low values for about 50 ft. from the portals, then they rise rapidly on going farther into the hill and maintain a high average to a point 260 ft. in, and beyond that point they

fall to an average which is between the first low and the succeeding high averages, showing conclusively that, following the contour of the hill for a distance of 50 ft. and normal to the slope of the hill, there is a zone of the porphyry which has been leached, and the value of the copper contents is not over 0.75%; that immediately below this leached zone is another zone which has been enriched, that is, the copper which was leached from the top zone has been carried down by the water and re-deposited in the zone below, and enriched the original rock which formerly carried only the same percentage of copper as is now contained in the zone below the enriched one. This enriched zone averages 2% copper and extends for 100 ft. below (normal to the slope of the hill) the leached zone. This enriched zone is a little thicker—probably 150 ft.—at the bottom of the canyon, as is shown by the horizontal distance on the maps showing the drill-holes. These holes were sunk near the bottom of the canyon. This is due to the constant tendency of the water to gravitate toward this level, making a larger quantity [of ore] here than on the sides. Another and equally important proof of this enriched zone, is the occurrence in the same horizon of high values of the well recognized secondary minerals of copper, namely covellite and bornite. The zone of material below the enriched horizon is the original rock unaltered by surface erosion or leaching, and averages 1.1% of copper, and constitutes the bulk of the deposit."

I give Mr. Minard's own words because it is well to place them on record. He recognizes a leached zone that reaches for 50 ft. from the surface, and within this zone the monzonite averages 0.75% copper. Next comes a zone of enrichment, 100 to 150 ft. thick, within which the copper abstracted from the surface zone has been precipitated upon the primary deposit, raising the copper content to 2%. Underneath the zone of secondary enrichment is the primary deposit containing 1.1% copper.

The average of all his samples was 1.6%, this being the average of the two upper zones, namely, those of leaching and enrichment. He did not estimate any ore below the zone of enrichment nor did he include any ore above the level of the creek, but only for 300 ft. above the creek, for 150 ft. at right angles to the hill-slope, and for 1600 ft. north and south. Thus he concluded that it was "reasonable to suppose" a mass of 9,000,000 tons of 1.6% ore available.

The only obstacle to success was the possible insufficiency of water to treat this ore by concentration. He considered that at least 2000 gallons was required per ton of ore treated, and referred to two possible sources of supply. The last paragraph of the report is as follows: "The property in question has excellent merit, but one cannot be enthusiastic over it on account of the water problem. There is no doubt as to the existence of the ore, under the conditions already noted, which can be readily and cheaply mined, and if the water supply can be satisfactorily determined I would recommend the erection of a 200 or 300-ton plant, to make extended experiments covering a period of at least a year, only upon the condition that you can acquire an interest in the property for the building of this plant without any payment whatever. It would also be advisable to acquire at the same time an option on the remaining interest. You would then be in shape to further develop the property, keeping constantly in mind the distribution of the ore along the lines as explained in this report."

The samples taken by Mr. Minard were shipped in duplicate to Canon City and Colorado Springs, where, after re-sampling for assay, they were collected and forwarded to the mill at Colorado City, to be subjected to a concentration test, which confirmed the results obtained in the stamp-mills at Bingham.

On June 4, 1903, a company was organized, called the Utah Copper Company, under the laws of Colorado, the capital being $500,000, in shares of $1 each. On July 1, 1904, there followed an issue of $750,000 worth of 7% bonds to run for three years and convertible into stock at par. These bonds were largely underwritten by the promoters themselves, for the Colorado group had made a good deal of money at Cripple Creek and 'Dick' Penrose, the distinguished geologist, owned a third of the Commonwealth mine, at Pearce, Arizona, which had yielded several million dollars in profit. Here I may mention that $250,000 was all the cash that was put up at the start in order to launch the Utah Copper enterprise. Colonel Wall was left with $150,000 in bonds as his share, and from the remaining proceeds of the bond-issue the promoters were enabled to pay Wall the purchase price, besides a 5% commission due to Cohen and Jackling. They still had to find the working capital—several million dollars—required to develop and equip the mine on an adequate scale. In the summer of 1904 the purchase of a block of stock was considered by, among others, the General Electric Company, for whom D. M. Riordan, assisted by E. Gybbon Spilsbury and W. Lawrence Austin, made an investigation, and reported favorably. Mr. Spilsbury's measurements showed that there was "at least 5,000,000 tons of 1.98% copper ore developed." He says† that the Copperton mill "had been brought to the point of profitable operation, the profits based on 13c. copper amounting even at that time to 70 cents per ton of ore treated." These estimates of Mr. Spilsbury fully corroborated the earlier figures of Messrs. Jackling and Minard; nevertheless they were received with skepticism not only by his own clients but by others that heard of them; indeed it was insinuated, so he tells me, that he had succumbed to the undue influence of Messrs. MacNeill and Penrose! However, when the business was heartily recommended by Mr. Riordan, on the strength of Mr. Spilsbury's report, to the directors of the General Electric, they seemed inclined to close the deal, until one of them remarked that he did "not believe the damn figures." That undoubtedly was the mental attitude of many others to whom the business was presented. Meanwhile an experimental plant of 300 tons capacity—called the Copperton mill—was built at Bingham. It was completed in April 1904. Shortly after-

†In a letter to the writer.

ward Messrs. Penrose and MacNeill bought De Lamar's surviving interest of one-eighth and re-organized the company, this time* incorporating in New Jersey with a capitalization of $4,500,000 in $10 shares. In 1905 the capitalization was increased to $6,000,000. In this year the Denver & Rio Grande Western railroad extended its line from Bingham to the mill-site at Garfield. The Bingham & Garfield railway, controlled by the Utah Copper Company, was not completed until August 1911. In 1906 the remainder of the original bond-issue of $7,500,000 was retired, at a premium of 5%, in order to clear the way for a new issue of bonds, namely, $3,000,000 at 6%, this money being required to build the Magna mill, at Garfield. The bond-issue was underwritten by the Guggenheims, in the name of the Guggenheim Exploration Co., and they, at the same time, acquired a block of stock. In January 1908, after the panic that marked the close of 1907, Hayden, Stone & Co. underwrote the purchase of a block of stock ($1,500,000), this stock being sold in order to provide funds for expanding the capacity of the mill. Thus the capitalization of the company was augmented to $7,500,000.

Two years later, in January 1910, the capitalization was increased to $25,000,000, of which $16,244,900 in $10 shares has now been issued. Out of the stock issue, amounting to $8,282,240, made in 1910, the sum of $3,100,000 was paid for the property of the Boston Consolidated, and $4,455,120 for 1,000,152 shares of Nevada Consolidated, the latter being a highly successful copper enterprise at Ely, Nevada. From the day when production began, in 1907, to the end of 1917, the mine has yielded 67,220,700 tons of ore, averaging 1.428% copper, producing 3,118,385 tons of concentrate, averaging 19.81%, and containing 617,785 tons of copper, enabling the company to pay $75,770,882 in dividends and accumulate a working capital of $30,285,889.

Colonel Wall was elected a director of the company when it was organized in 1903, but he resigned in 1908, owing to friction with his colleagues on the board. The result was to create bitter feeling between him and Mr. Jackling, a feeling that found vent in a journalistic vendetta, for Wall started a paper called 'Mines and Methods', which was published at Salt Lake City and under the not too scrupulous editorship of Claude T. Rice waged bitter war against Jackling and his associates from September 1909 to August 1913, when it ceased to appear. This animosity was due, as far as I can learn, not to personal wrong but to intense disappointment, on the part of Colonel Wall, in not being made manager of the company and in seeing the credit for the creation of the enterprise pass to Mr. Jackling, whose virile personality increasingly dominated the operations. One cannot withhold some measure of sympathy from the old miner, who stuck to his dreams so long and showed such patience in consolidating the property first, and then in nursing it during the long years that passed before his dream came true; but such sympathy is not inconsistent with admiration for the persistence and ability of the younger engineer, who, with equal faith in the prospect, brought the dream to fulfilment.

(To be Continued)

*On April 29, 1904.

Production of Quicksilver

Quicksilver production in the United States during the first half of 1918 was 17,576 flasks, according to F. L. Ransome, of the U. S. Geological Survey. The total in 1917 was 35,954 flasks, and as one-half of this is 17,977 flasks, the quantity thus far produced this year falls short by 401 flasks of that which should have been produced if the output this year is to equal that of last. As quicksilver, if not absolutely essential to the conduct of war, is a metal for which it would be exceedingly difficult to find satisfactory substitutes in all of its uses, and as an output of 36,000 flasks would, it is estimated, be barely enough to meet the demands in this country in 1918, the shortage indicated by the returns for the first half of the year calls for energetic efforts by the producers, the consumers, and the Government to increase the supply of the metal and to curtail less essential uses. With the enlargement of our Army the demand for quicksilver is likely to be considerably greater in 1919 than in 1918, and the perfection of satisfactory detonators for high explosives that shall contain little or no mercury is one of the urgent problems of chemistry as applied to war.

The decline in production during the first half of 1918 was due chiefly to the shortage and the increased cost of labor, and to the exhaustion of depletion of known orebodies under the stimulus of high prices for the metal. The practice at some of the larger mines has been to devote nearly all energy to getting out ore and to postpone underground exploration and development that are necessary to insure long-continued steady production. In the language of the miners, some of the mines have been 'gutted,' and considerable time will be needed to restore them to a condition of high productivity. On the other hand, the high price of quicksilver has not led as extensively as had been hoped to the re-opening of old miles long idle, although there are some notable examples of this result, and, during the second half of the year, these re-opened mines may make good the shortage. Quicksilver mining is full of uncertainties, and capitalists are slow to invest extensively in an undertaking whose future can be so little foreseen. There is opportunity here for patriotism to cast the deciding vote where the cold doctrine of chances might turn the investor to industries offering greater assurance of reward.

One of the notable achievements in the industry during the year has been the successful adaptation of the rotary cement kiln to quicksilver metallurgy. Eight of these furnaces are now or will soon be in operation in California, and they are expected to make an increase in production that may more than offset the falling off during the first half of the year.

The average monthly prices ranged from $128 to $112, or about $115.84 per flask for the six-month period.

Process for Recovering Platinum

By V. J. ZACHERT

Though the occurrence of platinum has been reported from many localities in the United States, little actual increase in production has resulted. The Western placers produce a few hundred ounces annually as a by-product; and this comes, more by accident than by design, in the course of gold-dredging and other forms of alluvial mining.

The platinum in these alluvial deposits is found in small scales or flakes, from one-eighth inch in diameter down to minute particles hardly visible to the naked eye. These flakes have a tendency to evade capture in the ordinary miner's sluice, so that a large part of this platinum has been carried in suspension to the tailing-dump. In the operation, after passing a large quantity of gravel over the riffles in the sluice, some of the larger flakes of platinum are retained with the other heavy concentrates and remain there until the clean-up, but the finer flakes, which are most abundant, are too light to resist the 'boil' in the riffle, and are lost.

As the preponderant amount of platinum in these placers is in the form of minute scales and an efficient method of saving it is of vital importance, some means other than gravity-concentration must be employed. The most feasible and economic means of saving all the platinum of these placers is by some arrangement to produce a rough concentration only, for the purpose of reducing the bulk by eliminating the coarse material and part of the valueless sand. Thus sand-concentrate can be produced averaging 75c. to $1 per ton, which would contain most of the platinum and other precious metals; and then subjecting this product to a further treatment.

An efficient apparatus for producing the low-grade platinum concentrate is the Neill jig, which is in successful operation on a number of gold-dredges in California and elsewhere. Though this jig is capable of saving the platinum in a low-grade sand-concentrate, the problem is to recover the platinum from this jig-concentrate efficiently and economically.

At the present time the means used is a shaking-table of the Wilfley type. This produces a high-grade concentrate, which can then be shipped to some refinery. It is unnecessary to discuss the ineffectiveness of separating fine platinum by simple gravity-concentration; exhaustive trials have proved it to be impracticable from a commercial point of view. A method by which the platinum will be separated in the form of crude bullion on the spot is the means upon which we rely for an increase in the production of platinum from our Western placers.

I present a method, discovered by myself, after experiments to ascertain the reason why metallic grains of platinum amalgamate with mercury only when the mercury is alloyed with sodium, and why, as soon as the sodium is spent, the platinum again leaves the mercury. When placing sodium amalgam in water the sodium immediately commences to decompose; the oxygen of the water combines with the sodium and forms sodium oxide, which dissolves, while the hydrogen escapes as gas. This chemical decomposition creates an electric current flowing from the electro-positive metal sodium to the electro-negative metal mercury. If the current is powerful some of the dissolved caustic soda in the solution is again deposited as metal on the mercury, and if a piece of platinum be placed upon the mercury it instantly will be plated with metallic sodium and the mercury will then envelop it; but if this amalgamated piece of platinum be placed in a glass of water the platinum will leave the mercury, as there is an insufficient quantity of sodium in the mercury to create the necessary electric current for its re-deposition. The reason why sodium amalgam has never been successfully applied to recover platinum in placer mining is that this function is not generally understood, and also the consumption of sodium caused by its decomposition in the water is prohibitive. In fact, it costs many times more than the value of the platinum recovered by its use.

I next proceeded to devise a means for producing a coating upon the surface of platinum that would remain permanent. Copper in solution as sulphate appears to be the most suitable metal for producing this coating upon the platinum, and zinc, mercury, and sulphuric acid serve as the means for generating the electric current. As these reagents, however, would be costly if used in large quantities when treating sands for the recovery of platinum, I determined the least amount of these reagents that could be used to obtain the desired result, step by step reducing the quantity of reagents until the limit was reached with a solution containing 0.05% copper sulphate and 0.05% sulphuric acid.

In practice the following procedure was found to give good results. Prepare a solution containing one pound of copper sulphate and one pound of commercial sulphuric acid, by dissolving the contents in 2000 lb. of water; the function of this solution is to serve as the electrolyte for creating the electro-chemical action when passing over the amalgamating plate with the platinum-bearing sand. On an ordinary amalgamating plate of standard dimensions sprinkle a little zinc amalgam (prepared by pouring molten zinc into a quantity of mercury and, on cooling, reducing it to powder in a hand mortar); or this powder may be fed periodically in small quantities into the sand-hopper so as to become thoroughly mixed with the sand before it approaches the amalgamating plate, thus producing a more uniform distribution.

In operation the platiniferous sand is fed from the hopper with the prepared electrolyte to the amalgamating plate; on its progress over the table the platinum and other precious metals present are seized by the mercury and firmly held, while the barren sand passes off as tailing; the electrolyte is pumped back into the storage tank and used again. It is remarkable to observe the avidity with which the platinum and the metals of its group will amalgamate by this method. Fully 90% of the metals remain as a spongy mass of amalgam on the first six inches at the head of the plate, while hardly a trace could be found at the foot. This method of recovering platinum and other precious metals is efficient and inexpensive. Consequently it allows the treatment of a large tonnage of low-grade platiniferous sand economically, and crude bullion, instead of concentrate, would be available to send direct to the Mint.

This method can be used also in estimating the platinum content in material too low in grade for reliable results by assay. The quantity of material that is usually taken for assay is so small that the sample must be quite rich in platinum to give reliable results. At this time, when platinum is so high in value, even the most careful and refined manipulation will fail to indicate an amount of platinum in a product that would have a market-value of 75c. to $1 per ton. In making a determination for platinum by this method, place 10 lb. of the sand in a gallon bottle, with one pound of mercury to which has been added 10 gm. of zinc amalgam. The electrolyte can be prepared by dissolving in 2000 cc. of water 1 gm. of copper sulphate and 1 gm. of sulphuric acid, then gently roll the bottle for 10 minutes. Then discharge the contents of the bottle into a pan and remove the sand by panning. The remaining mercury is squeezed through a chamois skin, the amalgam retorted, then the residue fused with a little borax in a scorifier, cupelled, and weighed.

There is a great deal more platinum in the alluvial deposits in the western part of the United States than is generally supposed, but its presence is difficult to determine without special efforts; first, because the quantity per cubic yard of gravel is not large, and, secondly, because of the illusive character of these minute flakes of platinum when associated in the pan with chromite, magnetite, and the other iron-bearing minerals composing the 'black sand' that also possess a metallic lustre when wet, and an observer is unable to be sure of the presence of platinum in the sample. I have tried this method with successful results also on a sample of platinum ore from British Columbia, and on concentrate from the Rambler mine in Wyoming. The latter must be given an oxidizing roasting before it can be subjected to the amalgamating process for the recovery of the platinum.

CHROME PRODUCTION of Rhodesia, east-central Africa, accounts for 50% of the world's total. In 1916 that country exported 62,000 tons. The 'African Herald' of August 31 states that Peake brothers have 2,000,000 tons of high-grade chrome in the Umvukives. This was discovered a year ago, since when considerable development has been done. Over 300 samples averaged 53% Cr_2O_3. There is also 1500 acres of chrome-bearing soil of good grade. A survey has been made for a railway 30 miles long from Banket Junction. It is estimated that the ore can be delivered at Beira, on the east coast, for $8.50 per ton.

Carbocoal

*One great advantage of the carbocoal, as compared with other forms of fuel, is that brought about by the formation of the semi-carbocoal at a low temperature. When coal has been coked at a low temperature and allowed to cool, it will no longer soften and continue the process of coking when again heated. The character of coke so formed is entirely different from that of coke made at a high temperature. It probably occludes more oxygen, and is more readily acted on by the oxygen of the air, and probably burns with less excess of air than is required for burning other fuel. One interesting factor is the marked reduction in the formation of clinker, as compared with the coal from which the carbocoal is made; this is hard to understand. The carbocoal will naturally carry more ash than the coal from which it is made, but owing to the uniform grinding and mixing, the ash is distributed uniformly, and probably every particle of the ash is covered with a layer of soft coke in the initial coking. This may have some effect in reducing the tendency of the ash to clinker, and may enable it to drift away from the zone of highest temperature before it becomes so fused as to give trouble. In addition to its value for ordinary gas-producers or Mond gas-producers, the carbocoal should have special value in connection with suction gas-plants. The wider adoption of such plants has been retarded by the difficulty of securing adequate supplies of suitable fuel. While carbocoal undoubtedly can be used for steam purposes, it looks as if it would have much greater value in the domestic trade, where it could take the place of anthracite. One of the difficulties in the production of large amounts of ammonia from coke-oven gases has been the apparent limit to the demand for coke; but the demand for such a material as carbocoal will be far more extensive, and it is not unreasonable to expect that in time a large amount of nitrogen compounds, so greatly needed in agriculture, will be derived from this source.

ZINC FERRATE is produced when blende is roasted at too high a temperature. The chief difficulty in obtaining a good extraction of zinc in leaching the calcine is eliminated by careful attention to this detail so as to reduce the proportion of that insoluble compound. Thomas French asserts that there is no difficulty in obtaining 90% extraction from zinc ores assaying as high as 15% of that metal and 25% iron, and roasted zinc concentrates may be counted upon to yield as much as 95 to 97% of the zinc on treatment with sulphuric acid.

*Abstract: Discussion in Trans. A. I. M. E. by Charles Catlett.

Colloids in Flotation

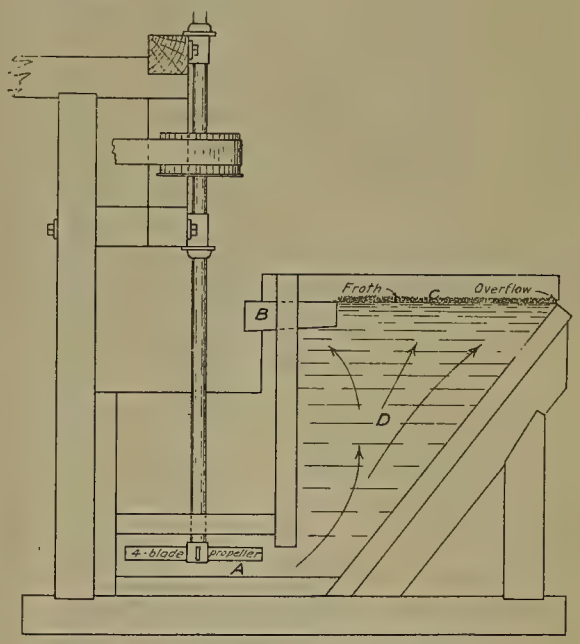
By JACKSON A. PEARCE

The very fine amorphous material in crushed ore usually spoken of as colloids or colloidal matter seems to have escaped the professional discussion usually accorded to a subject of such importance. If metallurgists generally are giving the subject serious consideration they are not giving to the profession their due share of the findings, whether positive or negative. Now and then brief notes on the agglomeration of colloids by acids or alkalies find their way into print leading us to believe that such colloids are troublesome, while others maintain emphatically that without colloids flotation is impossible. My own experience has been that colloidal matter in flotation is a nuisance, and worthy a systematic investigation by those in position to make it.

Several years ago I was called upon by a custom-mill in Clear Creek county, Colorado, to adapt flotation to the general run of ores in that district. After spending several weeks in useless endeavor to find an oil adapted to the ore on which we were working, I made a series of changes in the machine itself. One day, after weeks of discouraging work, we made an alteration that necessitated an empty machine. Upon starting after the alteration we were surprised to get an excellent froth, heavily laden with sulphides. This was the first genuine flotation any of us had seen, and the event elicited congratulations from the staff. I passed the cigars around as befitted an occasion of such importance and of such felicity, and as we watched developments we smoked. Soon we had occasion to regret both congratulation and cigars, for there was a gradual increase in the volume of froth, and as the volume increased the sulphides decreased. At the end of two hours we had more froth than we could handle—and no mineral.

This action of the machine led me to correlate certain other data that had come under my observation, the importance of which I probably would have recognized sooner had I not been led to believe that each ore required a certain oil, to find which was the supreme and ultimate duty of the flotation metallurgist. Several times before, I recalled, the froth was slightly better immediately after starting the machine. At other times, when the machine was at its worst, throwing off barren froth in such abundance as to require the efforts of two men to sluice it into the river, I would take samples of the feed and try them with different oils in the testing-machine. Although several oils gave good results in this machine, none of them worked well in the big plant. I recalled also that some time previously, in making flotation tests on cyanide-tailing, 85% of which would pass 200-mesh, I could get no mineral-bearing froth until a large part of the colloidal matter had been removed. Now, the machine in use was of a well-known type with bottom-discharges regulated by valves. There were openings in the partitions of the froth-cells to assist in equalizing the pulp-level in these cells. The bottom-discharges favored the elimination of the coarse material while the back-flow through the partition-openings favored the accumulation and retention of the fine material, thereby increasing the proportion of colloids within the machine. With all these data correlated it looked as though the colloidal matter exercised considerable influence over flotation.

Assuming it was the increase in colloidal matter that



MACHINE FOR DECREASING THE EFFECT OF COLLOIDS IN FLOTATION

prevented flotation, I proceeded to alter the machine so as to prevent its effect as far as possible. Closing the holes in the froth-cell partitions to prevent the back-flow, raising the openings between the agitation and froth cells to get a better circulation of slime, and many other minor changes all of which contributed, I was able to get a better recovery than I had expected. However, it soon developed that many ores could not be treated successfully even with the improved conditions, and that it was necessary to discriminate carefully in the purchase of ores. This limited the field of operation, a serious handicap to a custom-mill.

Later on, still adhering to the supposition that colloidal matter was the source of our trouble, I designed a machine to reduce its effect. The accompanying sketch

shows a cross-section of the new machine. In the figure, *A* is the agitation-cell. The pulp is forced up through the froth-cell *D*, overflowing at *B*, while the froth collects at *C* and may be removed in the customary way. The advantage of this type of machine is that with an upward circulation of the pulp in the froth-cell and a discharge wholly at the surface, the coarser or granular material tends to remain behind, while the lighter or colloidal matter passes forward in preference. In this way granular material will accumulate within the machine. Eventually an equilibrium is reached where the composition of the overflow practically is the same as the feed, yet the proportion of colloidal matter within the machine itself is much less than that in the original ore.

It may be interesting to know how this machine, devised on theory, worked out in practice. A 24-in. six-cell machine of this type was built, in size and cells the same as our old machine. For several weeks we ran the two in parallel, treating not one ore but many ores. The net result was strongly in favor of the new machine. Based on the feed to the machines, the new machine showed an average increased recovery of 19.8% of the gold, and 27% of the silver. Incidentally, the consumption of power dropped from 6.5 to 1.8 hp-hour per ton of ore. In the third day of this test with a high-grade silver ore the new machine showed a net gain of $322. The assay from which this figure was obtained was confirmed by panning the tailing. Later work showed that while this increased recovery was maintained on the general run of ores, on two ores the difference was little, both machines yielding a high recovery. The success attending these tests led to the installation of another machine to replace the old one and also to less discrimination in the purchase of ores.

Notwithstanding our success with the general run of ores, we received two or three that gave that direful voluminous barren froth. On these ores we were able to make a fair recovery by treating the slime and re-ground sand separately. The separation was made in a Dorr classifier preceding table-concentration. After table-concentration the re-ground sand was sent to one machine, while the slime, after table-concentration, was sent to another machine. The recovery on the sand-machine was good, and as the sand amounted to about 70% of the whole, the total recovery was fair; also by placing a small thickener between the slime-tables and the slime-machine, and maintaining a heavy overflow we were able to wash away a sufficient amount of the colloidal matter to permit a fair recovery on the remainder. The slime thus sent to waste was of higher assay-value than that of the original ore, but it was of limited tonnage. At any rate, it was more economical to discard some and recover the remainder than to treat it all and recover nothing.

I carried out a number of experiments on other ores to show the relative importance of treating the sand and slime separately and together. While the tests showed no pronounced advantage in treating sand and slime together, owing to the unfavorable conditions under which they were carried out, I have a suspicion that a higher recovery can be made on some ores by treating the sand and slime together. With most of our ores it was better to treat the sand and slime separately, and with a few it was imperative. Treating ores from so many different mines, I found it safer at all times to keep the sand and slime separate.

With these machines to increase the proportion of granular material, or rather to decrease the proportion of colloidal matter in the treatment of all ores, and with a small thickener for the elimination of colloids from some ores, our field of operations was greatly increased, in fact, it was more than doubled, and justified the company in the acquisition of another mill. During last year we treated ores from 95 different mines scattered over a distance of 20 miles. This statement would not convey much meaning if applied to the Mother Lode or to the Rand, on account of the similarity of the ores of the different mines in those districts, but here a different mine means an ore essentially different both as to matrix and valuable minerals. Here we find as great a difference in the ores of adjoining mines, or of different ore-shoots in the same mine, or of different levels in the same ore-shoot, as one would expect to find between the ores of Modderfontein and Tonopah. Aside from oxidized ores, little or no discrimination was made in purchasing. We successfully treated ores assaying as high as 133 oz. silver per ton; gold ores as high as 5 oz.; lead ores up to 40% lead; copper up to 10%; and zinc ore of varying qualities. Two or three times during the year we received ores from which no saving could be made on the slime-machine. The sand-machine worked well at all times.

We had two mills in operation, a stamp-mill, with a pebble-mill for re-grinding, and a mill equipped with crushers, rolls, ball-mill, jigs, tables, etc. In the stamp-mill from which the above data were taken, the ore was crushed to 16-mesh before the separation of slime was made. In the other mill the ore was crushed to 3½-mesh and the slime separated. It is interesting to note the behavior of the re-ground products when subjected to flotation. Crushing to 16-mesh before separating the slime, the re-ground sand gave very little froth and no large bubbles, but every small bubble was thoroughly saturated with sulphides. As the sulphides in the ore diminished to the vanishing point the froth likewise decreased, in consequence of which some ores gave nothing in the way of froth. On the other hand, when re-grinding the 3½-mesh sand the froth was at all times voluminous, consisting of a mixture of both large and small bubbles and sometimes was barren even in the presence of abundant sulphides. It was shown in the course of time that an ore crushed to 16-mesh before separating the slime therefrom might yield well to flotation, whereas the same ore crushed to 3½-mesh and the slime separated before re-grinding might yield nothing, although this was rare.

I may be wrong in the supposition that the proportion of colloidal matter within the machine has a decided influence over flotation, but on that assumption I have been

successful with these ores. The argument for this method of treatment seemed to be sufficiently novel and well founded to justify the Patent-Office in allowing a process patent. This accumulation of colloids within the machine might also explain why, in places, some machines must be emptied periodically to maintain a good recovery.

The reason for this I cannot explain, and there is no necessity for obscuring the results of operation by citing the theories already advanced, no one of which is generally known or well established. All the data I have given seem to sustain this argument. Cyanide-tailing was not amenable to flotation until a large amount of colloidal matter had been removed. Our flotation machine passed gradually from an excellent froth to a barren froth as the back-flow of the machine increased the proportion of colloids therein. The machine with its increased colloids gave no mineral-bearing froth while a sample of the feed without additional colloids, treated in a single-cell machine, gave a good froth. Crushing to 16-mesh would liberate a larger proportion of colloidal matter for separation than crushing to 3½-mesh, hence the difference in behavior of the re-ground products. Eliminating colloids by means of a thickener increased the recovery in some instances.

The absence of all or nearly all colloidal matter might end most of our flotation troubles. Unfortunately this is not always feasible economically, as in some instances such colloidal matter constitutes a large part of the ore and may be sufficiently impregnated with valuable minerals as to render its elimination wasteful. I have noticed that on some ores violent agitation would yield no satisfactory result, whereas the same ores moderately agitated would yield a good recovery, and in some cases the mild cascade action gave the best result. On the other hand, some ores require violent agitation, showing clearly that flotation is sensitive to mechanical changes. My experience has been that the mechanical treatment of colloidal matter is far more encouraging than its chemical treatment, and to me it seems the logical field for investigation. That well-worn but misleading slogan, "an oil for every ore," might be more appropriately rendered, "a machine for every ore."

Invested Capital

One of the chief stumbling-blocks in equitable administration of the excess-profits tax has been the definition of 'invested capital,' says the 'Boston News Bureau.' At the hearings before the Ways and Means committee it was suggested that the following definition be substituted for that contained in the present law:

(*a*) In the case of a corporation or partnership:

(1) The actual cash value of all the tangible property of the corporation or partnership, including mines and mineral deposits, as of March 1, 1913, if such property was acquired prior to said date; or, if acquired on or after said date (*a*) the actual cost thereof in money; or (*b*) the actual cash value, at the time of payment, of tangible property other than cash paid thereof; or (*c*) if otherwise acquired, the actual cash value thereof, at the time of such acquisition; and

(2) Paid-in or earned surplus and undivided profits acquired on or after March 1, 1913, used or employed in the business exclusive of undivided profits earned during the taxable year.

In the argument submitted in support of the changes John R. Vanderlip and Frederick C. Stevens said in part:

"The foundation upon which the present excess-profits tax law and the income-tax law rests is, that, as between the Government and the taxpayer, a line of demarcation is drawn (on the 1st of March 1913 as respects income taxes, and on January 1, 1914, as respects excess-profits taxes), distinguishing between the period prior to the dates named, when neither of said taxes could lawfully be levied by the Government, and the period after said dates. Whether a taxpayer gained or lost in the carrying on of his business prior to the date constituting such line of demarcation is immaterial. Upon all income, gains, and profits derived by a taxpayer after the specified date, the Government has the authority, which it is exercising, to impose income and excess-profits taxes. The basis for the depletion allowance under the income-tax law, and for the deduction permitted under the excess-profits tax law, should be the actual invested capital of the taxpayer on the 1st of March 1913 and the 1st of January 1914, respectively (unless, as would seem reasonable for the sake of uniformity and consistency, the date of March 1, 1913, should be adopted for both laws).

The definition of 'capital' in a tax law cannot be abstractly accurate. The aim should rather be to make it practical. The definition, therefore, should be one in consonance with the recognized understanding and practice of business-men of the country where the law is operative. The adoption of this proposed amendment will eliminate one of the elements of complication and doubt which has produced so much confusion in the application of the law; and, as respects owners of mineral properties, will give the additional advantage of conforming the definition of 'invested capital' in the excess-profits tax law, to the basis of valuation for the purpose of depletion allowances incorporated in the income-tax law. It will also greatly simplify the administration of the law by the Treasury Department. It is therefore submitted that, for the purposes of the excess-profits tax, the actual value of the invested capital of a mine-owner, as of the first of March 1913 should be adopted as the basis for determining the amount of his earnings which shall be free from excess-profits tax. The suggested definition of invested capital, if adopted, will in large part efface the inequality in the operation of the law of which criticism is so widely heard. It will give every enterprise the exact standing as respects income-taxes that it had in the business world on March 1, 1913—a standing based upon its actual resources and not upon inaccurate and artificial standards of measurement. . . ."

Charcoal as a Precipitant of Gold

*In discussion of a paper by H. R. Edmands on the use of charcoal for precipitating gold from its solution in cyanide, W. R. Feldtmann confirms the observation that the activity of the charcoal as a precipitant is enormously increased by wet grinding, without screening. In the experiments much of the charcoal was apparently in a colloidal condition, and this influence has an important effect on the precipitating power of the charcoal.

The effect of reducing the charcoal from a coarsely granular to a finely granular condition is, as Mr. Edmands has shown, and as might be expected with such a porous substance, only a small one. The increase in precipitation due to crushing from $-\frac{1}{8}$ in. $+1/20$ in. to $-1/100$ in. $-1/150$ in. grade (the finest dust being screened out) is relatively unimportant and is certainly not proportionate to the increase in surface of the charcoal granules. When, however, by wet grinding without screening, the comminution is carried much further, a precipitant is produced of which the increased activity is so great as to be almost of another order. In making this discovery Mr. Edmands has definitely brought the use of charcoal as a precipitant for cyanide solutions within the scope of practical technology. Mr. Feldtmann carried out a few confirmatory experiments. The solutions contained only distilled water and $KAuCy_2$, equivalent to 67.2 mg. gold per 150 cc. The charcoal used was cocoanut-shell charcoal. The fine grinding was done in a Wedgwood mortar with water, for some minutes, the water used being measured and allowed for in the gold tenor given. The time of contact was 22 hours. Even with the limited amount of grinding, a considerable proportion of the charcoal became so fine as to remain suspended in the solution during the 22 hours contact. The subsequent behavior of the charcoal on filtering seemed to indicate that some of it was in a colloid state.

The precipitation results were:

	Quantity of solution, cc.	Gold precipitated, mg.
3 gm. finely ground charcoal	150	57.54
3 " " " "	300	80.40
3 " coarsely granular "	150	14.70

It is seen that the effect of even a very limited amount of fine grinding is considerable. The experiments serve to show that, owing to the difficulty in filtering finely ground charcoal, some special form of apparatus would be necessary in order to apply the precipitation process successfully. Such apparatus Mr. Edmands seems to have succeeded in devising. The increase in precipitating effect as the result of fine grinding is probably due, not so much to an increased area of granular particles of charcoal as it is to the formation of colloid carbon.

The auric cyanide salts, $NaAuCy_4$, $KAuCy_4$, and hydrogen auric cyanide, $HAuCy_4$, are scarcely, if at all, precipitated by charcoal. This is a point of considerable interest, which does not appear to have been noted previously, and only became known to Mr. Feldtmann recently. The following are two sets of tests illustrating this point. In each test 3 gm. of cocoanut charcoal in coarse pieces was left in contact with 150 cc. of the gold solution overnight:

		Precipitated, mg.
1a.	Solution containing 68.0 mg. Au as $KAuCy_2$	13 3
1b.	Solution containing 65.5 mg. Au as $KAuCy_4$	1.3
	Time of contact, 22 hours.	
2a.	Solution containing 67.2 mg. Au as $KAuCy_2$	10.4
2b.	Solution containing 66.6 mg. Au as $KAuCy_4$	nil
	Time of contact, 17 hours.	
2c.	Solution containing 67.2 mg. Au as $HAuCy_2$	20 7
2d.	Solution containing 66.6 mg. Au as $HAuCy_4$	0.23
	Time of contact, 22 hours.	

The relative precipitating power of different kinds of charcoal is shown below. In each of the cases cited below, 10 gm. of the freshly prepared charcoal, crushed to $-1/10$ in. $+1/30$ in., was left in contact with 200 cc. of solution containing 0.22 gm. KCN and 17.2 mg. gold per 100 cubic centimetres.

	Precipitated, mg.
Lime-wood charcoal	32.28
Birch	31.68
Larch	31.08
Laurel	28.9
Hazel	27.88
Almond	26.88
Cocoanut-shell	11.0
Bone	8.4

Although coarsely granular cocoanut-shell charcoal gives a relatively low precipitating efficiency, it is a convenient medium, and different samples prepared at different times give consistent results. Both cocoa-shell charcoal and bone-charcoal are notably denser than any of the ordinary wood-charcoals, and when used in coarsely granular form sink at once, whereas the wood-charcoals all float for at least part of the time of contact.

This method of precipitation is meeting with success in Australia.

*Abstract: Bulletin, Institution of Mining and Metallurgy.

MOLYBDENITE occurs in three definite types in the Pontiac deposits, according to a paper by E. Thomson in 'Economic Geology' for June. These are: 1. Associated with slightly more basic segregations in the granites, syenites, or gneisses, as seen in the Laurentian deposits in Pontiac county, Quebec. 2. In intimate association with pyroxene in the 'contact pyroxenite' of the Grenville series (Canada) or in the partly digested rock present where this process of silicification has been active. 3. In pegmatite dikes. The characteristic accessory minerals in the first type are fluorite and tourmaline; in the second type scapolite and titanite, along with pyroxene, but pyroxene may be abundant without any sulphides being in evidence. The second type of deposit is the more common. Pyrite and pyrrhotite are generally found accompanying the molybdenite, scapolite, and titanite. On oxidizing they discolor the rock, usually giving it a dark appearance, such as prospectors term 'burnt'.

ORE-RESERVES of the Mount Morgan mine, Queensland, are estimated as 3,825,685 tons, assaying 2.58% copper and $6.16 gold per ton.

Separating Barium From Strontium

By JOHN WADDELL

In a textbook on quantitative analysis recently published* a volumetric method is given for the determination of lead in ores, which depends on obtaining the lead as chromate, dissolving the chromate in dilute hydrochloric acid, adding potassium iodine and titrating the iodine set free by means of sodium thiosulphate. This is an extremely accurate method and duplicates should agree within a few hundredths of one per cent. In Bulletin 422 of the U. S. Geological Survey, details are given of a method for the separation of barium and strontium by precipitating the former as chromate by means of ammonium dichromate. A solution of ammonium dichromate containing 100 gm. to the litre, and another of ammonium acetate 300 gm. to the litre, are used. A double precipitation is said to be necessary to free the barium from the whole of the strontium. The barium chromate thus obtained is ignited and weighed. As the ignition of barium chromate gives some trouble, it seemed to me that it could be determined volumetrically with greater ease, provided a sufficient number of determinations are to be made to warrant the trouble of standardizing a solution of sodium thiosulphate.

The equations involved are:

$$BaCrO_4 + 2HCl = BaCl_2 + H_2CrO_4$$

$$2H_2CrO_4 + 12HCl + 6KI = 6KCl + 2CrCl_3 + 8H_2O + 3I_2$$

$$6Na_2S_2O_3 + 3I_2 = 6NaI + 3Na_2S_4O_6$$

In testing the method I observed the precautions that had been found necessary with lead. Having made a solution of 3 gm. of crystallized barium chloride ($BaCl_2 2H_2O$) per litre, I precipitated two lots of 50 cc. each, filtered in a Gooch crucible, ignited, and weighed. I then dissolved these precipitates and titrated with a sodium thiosulphate solution, of which 25.45 and 25.34 cc. respectively was required. I repeated the determination without, however, igniting the precipitates, again in two lots of 50 cc. each, requiring 25.10 cc. and 25.05 cc. of thiosulphate. Three students in the laboratory made determinations as well, and after some preliminary experimenting they obtained in succession 25.05, 25.08, and 25.09 cc.

The details of the process were as follows: To 50 cc. of the barium chloride in an Erlenmeyer flask, 10 cc. of the ammonium acetate solution mentioned above was added, the liquid brought to boiling, and while the flask was given a swirling motion, 5 cc. of the ammonium dichromate solution was added. The flask was boiled for a minute and then cooled, since barium chromate is somewhat more soluble in the heat than in the cold. The whole was filtered through a Gooch crucible, and the soluble chromate, of course, thoroughly washed out of the Erlenmeyer though the solid barium chromate was not entirely removed. The washing of the flask was done with successive quantities of cold water, to which a few drops of the ammonium acetate solution was added. When the precipitate was completely washed, it was removed, along with the asbestos, to a beaker, and part of a mixture of 25 cc. of concentrated hydrochloric acid and 75 cc. of water was used to dissolve it, and the whole was poured into the Erlenmeyer containing the remainder of the barium chromate. The rest of the acid was added, and the solution was made up to about 200 cc. Unless 25 cc. of the concentrated hydrochloric acid is used the subsequent titration will be too slow; but the acid must be diluted and must not be hot, else, by its action on the chromate, chlorine will be set free. Then, after the reading of the burette containing thiosulphate was taken, about a gramme of potassium iodide was added to the liquid in the flask. After shaking to ensure the liberation of the iodine the titration was begun immediately to avoid escape of any iodine. In order to give time for the reaction the thiosulphate should not be run in more rapidly than two or three drops per second. If four or five grammes of potassium iodide is added instead of one, loss of iodine undoubtedly would be prevented, even on standing for five or ten minutes, and the titration with thiosulphate thus could be made rapidly. When the brown color of the iodine had nearly disappeared starch paste was put in and thiosulphate added, a few drops at a time, with alternate vigorous shaking, until the blue color was almost gone. Then about 10 cc. of concentrated hydrochloric acid was added and the liquid was warmed to blood heat, in order to hasten the last stages of the reaction. A drop or two of thiosulphate usually sufficed to discharge the blue color, and then the burette reading was taken.

Among the first determinations made by the students was one intended to test the necessity of a double precipitation of barium in its separation from the strontium. To 50 cc. of the barium-chloride solution about 0.15 gm. of strontium nitrate was added, and, after one precipitation of chromate, 25.91 cc. of thiosulphate was required, whereas, after a double precipitation of the barium chromate, 23.40 cc. of thiosulphate was needed. When no strontium was present the student making this test had found that 24.50 cc. was required for the barium chloride alone. It appeared that in a single precipitation strontium, if present in considerable quantity, was carried down appreciably with the barium, and that in the re-precipitation some barium was lost. As indicated

*'Quantitative Analysis in Practice.' John Waddell. P. Blakiston's Son & Co.

above, further investigation showed that 24.50 cc. was incorrect for the barium chloride alone, but the substitution of the correct figure, 25.10 cc., would not affect the conclusion, and it was evident that something was wrong in the details of the process.

The following procedure finally was found to be satisfactory. The precipitation and filtration having been made as described, the chromate was dissolved from the asbestos while still in the Gooch crucible, by as little hot 1:1 nitric acid as would serve the purpose, alternating with hot water. The acid having been thoroughly washed out, the solution was brought into the Erlenmeyer, made up to about 50 cc., and heated to boiling. After the addition of dilute ammonia until a permanent but not abundant precipitate of chromate was formed, 10 cc. of ammonium acetate solution and 5 cc. of ammonium dichromate were added. For complete immediate precipitation a considerable excess of dichromate was advisable, and as much as 5 cc. apparently was not disadvantageous. Following the addition of dichromate the whole was boiled for less than a minute, and, after cooling, the filtration and titration were made as previously described.

In the determination made in this way, the starch solution added contained some lumps which did not break up on shaking. These retained the blue color until 25.10 cc. of thiosulphate had been added, which was what was required when no strontium was present. As the rest of the solution, however, was decolorized by a slightly smaller amount of thiosulphate, it was not quite certain that I might not have overshot by a few drops, and two students made the separation in the manner described. One found 25.33 cc., the other 24.96 cc., as the amount of thiosulphate required. The probability is that this degree of accuracy easily can be attained by most students; and that after two or three determinations had been made, the duplicates would agree within a few hundredths of a cubic centimetre.

In the separation of barium from strontium in barite, after fusion with sodium carbonate, leaching, and filtration, by which alkaline-earth carbonates are obtained on the filter, the process of dissolving the precipitate in hydrochloric acid, separating the strontium from the barium, and determining the latter, in no instance should take more than an hour. If the amount of strontium is known to be small, one precipitation only would be required, and the time could be correspondingly shortened. This method of separation would apply even if the barium chromate were ignited, but in a double filtration through the Gooch crucible and ignition of the precipitate there is danger of loss of asbestos, and the time and trouble required in weighing the crucible before and after filtration are to be considered. For a single determination this time would be less than that required for the standardization of the thiosulphate, but for a series of determinations the standardization can be made against a weighed quantity of barium chloride or nitrate without difficulty, and the time required for this operation is of little moment.

What is Radioactivity?

*Radioactive substances will affect a photographic plate and will ionize gases. This is due to the fact that radium and its salts give off three types of rays, called the alpha, beta, and gamma. The alpha rays travel with a velocity of about 20,000 km. per second and are positively charged. It was early found by Rutherford that their mass was comparable to that of a helium atom; and he definitely made the statement before the proof was actually obtained that the alpha particle was a helium atom with two positive charges on it. This was afterward proved by Sir William Ramsay and Professor Soddy, who dissolved some radium chloride in water and allowed the occluded gases to run into a spectrum-tube which had previously been evacuated. On allowing these gases to stand for a day or two, the spectrum of helium gradually appeared. The beta rays consist of negatively charged electrons, with a mass of about 1/1600th of a hydrogen atom. During radioactive changes, they are ejected with a velocity of from 100,000 to 186,000 miles per second. While the alpha particle is stopped by an ordinary sheet of note-paper, the beta particle will penetrate a thin piece of glass, but is completely stopped by lead one millimetre thick. All evidence points to the fact that the beta particle is similar in its properties to the electron found in a Crooks tube, and gives rise to cathode rays. The gamma rays are not material in character but are vibrations of very short wave-length in the ether. Just as the X-rays are formed in an X-ray tube by the stoppage of the cathode rays by impinging on the target, so the gamma rays are formed during radioactive changes when such changes give rise to beta rays; and these rays are expelled from the atom with the velocity of light. It is evident, therefore, that the gamma rays are practically identical with the X-rays, except that they are of shorter wave-length and penetrate matter to a much greater extent. Anything, therefore, is radioactive that gives out alpha, beta, or gamma rays, or all of them. All radioactive changes are accompanied by at least one of these rays. The elimination is due to the explosion of the radioactive atom, such explosion taking place at a definite rate, so that, in the case of radium itself, half is completely transformed in 1690 years. In the second 1690 years, half of what is left will have been changed. In the third period of 1690 years, half of what is left at the end of the second period will have been changed—and so on. The 1690-year period is called the half-life or half-value period of radium; and it can be readily seen that in 10 times the half-life period, only about 1% of the element will remain unchanged.

STEEL-WORKERS' WAGES have been raised 133% between January 1916 and October 1918, from $2.20 to $4.62 per 10-hour shift. In 1913 the U. S. Steel Corporation paid $2.85; now the average is about $6 per day.

*Richard B. Moore, Trans. A. I. M. E., Sept. 1918.

RENO, NEVADA

Manganese and Iron Deposits.—Tungsten Mills.—Technical Training.—Silver Revives Old Centres.—Recovering Gold and Quicksilver from Old Tailing.

Manganese deposits of Nevada are to be examined for the War Industries Board, and Walter S. Palmer, of the Mackay School of Mines at Reno, has been commissioned to report on all known deposits and on production. A large output has been made from a property near Las Vegas, in the southern end of the State, where extraction has been resumed lately after a brief suspension. Other deposits of considerable magnitude have been reported to exist near Coaldale, on the Tonopah & Goldfield railroad; near Cuprite, south of Goldfield; as well as in Elko, Humboldt, and Lyon counties. The vein near Coaldale is said to be over 20 ft. wide, forming the hanging wall of a deposit of manganiferous iron. The iron is of bessemer quality, containing little silica or phosphorus; and the lime capping, below which the ore is found, covers an area of great extent. Other large deposits of iron ore have been sampled and prospected lately, and attention is being directed to this metal for the first time, owing to expansion in iron and steel manufacture on the Pacific Coast.

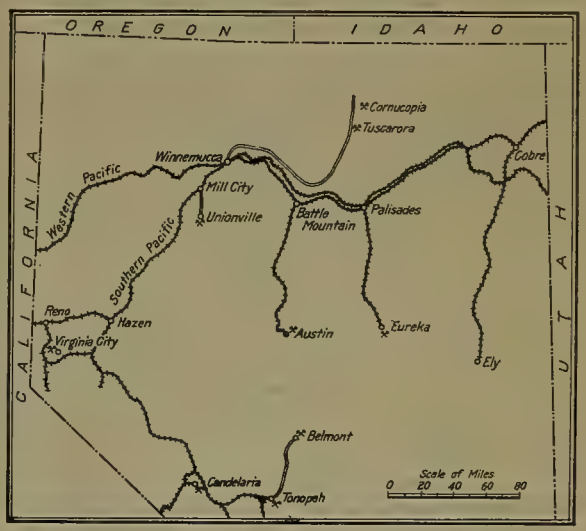
Two mills of 100 and 125 tons daily capacity, designed to dress tungsten ore, are nearing completion at Tungsten, near Mill City, in Humboldt county. A concentrating plant at Toulon, on the main line of the Southern Pacific, has been dressing ore from the same district, but hereafter will receive tungsten ore from the Winnemucca Lake district. The mills at Tungsten will concentrate ore from the mines of the Nevada Humboldt Tungsten Co., The Pacific Tungsten Co., and the Mill City Tungsten Co. Both mills were designed and constructed by K. Freitag of San Francisco. Water is obtained from the Nevada Valleys Power Co., which has laid a 6-in., wire-bound, redwood pipe-line over 4 miles long, with storage-reservoirs of 50,000 and 100,000 gal. capacity. Power has been supplied by a 34-mile transmission-line connecting with the Rochester line. Development of tungsten deposits has been resumed near Sodaville, in Mineral county, and two mills are proposed near this point.

Secondary mining schools are being conducted at Goldfield, Tonopah, and Ely, under the direction of Francis Church Lincoln, head of the Mackay School of Mines of the University of Nevada. Another school, similarly equipped, is traveling through the State, giving short courses in instruction at various mining centres. The courses are designed to fit men to become assayers, solution-men, cyanide or flotation-mill foremen, smelter foremen, machine-men, or assistants to geologists. The instructors are professors from the State mining school, and the classes have had a fair attendance. Mr. Lincoln reports a large demand for mine foremen, assayers, and other skilled workmen.

The high price of silver has resulted in reviving several of the famous old bonanza camps, notably Eureka, Austin, Candelaria, Belmont, Tuscarora, Unionville, and Cornucopia. Many isolated mines and prospects are again being worked. A. J. Stinson, State mine inspector, reports a greater number of mines in operation than at any time in recent years, although work is hampered by the shortage of labor and by the inefficiency of available labor.

The Candelaria Mines Co., headed by New York and Rhode Island men, has acquired the Badger, H. G., and Lucky Hill claims, and will erect a cyanide mill to treat the old dumps and stope-filling of the Argentum and Mount Diablo mines, paying the owners a royalty of 75c. per ton. It is said that sampling has indicated 1,000,000 tons of $14 ore. Development in the Lucky Hill has exposed high-grade ore, and in August, 8 men produced ore worth $14,000. The silver is a chloride, with a little gold.

Austin, in Lander county, is another of the old silver dis-



PRINCIPAL SILVER DISTRICTS OF NEVADA

tricts being revived. The Austin Dakota mine is being reopened to a depth of 200 ft., and is showing some high-grade ore, in addition to large bodies of good milling ore. Development has been in progress on other properties and a large tonnage of medium-grade ore has been blocked out.

Placer mining is recovering amalgam containing gold and silver from the bed of the Carson river, 6 miles below Empire, where bends in the river have caused to be deposited in the form of bars large quantities of tailing from the Santiago, Vivian, Merrimac, Brunswick, Morgan, and Mexican mills, which treated the product of the Comstock bonanzas. In the earlier period the ore had a greater gold than silver content, in the proportion of 60 gold to 40 silver. A tremendous quantity of quicksilver was used in the pan-amalgamation process, and all of this was finally lost in the tailing, while extraction of the metals was rarely above 65%. Sumps are dug in the sand of the river-bed, which contains many boulders precluding the use of dredges, and a 2-stage, 3-in., motor-driven centrifugal pump delivers the water and sand under pressure to another sump, where it is taken by a 4-in. Byron Jackson centrifugal pump, which raises the gravel 16 ft. to the sluice. The sluice is 65 ft.

long, lined with ordinary Hungarian riffles and cocoa-nut matting under expanded metal. Five feet from the end of the sluice, ⅛-mesh screens are used as a grizzley to carry the fine material to a side sluice, thus saving the concentrate on an under-current. Panning reveals some native quicksilver and quantities of carse lumps of amalgam. Tests appear to have proved the existence of quantities of valuable material in the river-bed, and production is said to be a question of mechanical methods. Tests have been made at the Mackay School of Mines at Reno, and the best results have been obtained in washing in sluices. Bedrock has not been reached, and a coarse concentrate recovered from the first tests assayed $15,166 gold and silver, and 20% mercury. Fine from this sample assayed $25,248 gold and silver, and 17% mercury; while third-grade fine assayed $1000 in precious metals. Amalgam recovered separately from the fine had a value of $1.05 per ounce. The operation, which is yet in the pioneer stage, is conducted by the Unevida Gold Mining Co., a Delaware corporation, of which A. B. Lewis of New York is president; W. S. McCornick of Salt Lake City, treasurer; and W. C. Ralston, Jr., secretary and manager. Some profitable hand-sluicing was done during the period of mill operation, but the present undertaking is the first to apply power to the recovery of metals from the river-bed.

Southern Nevada mining men are becoming interested in placer mining in Tule canyon, a branch of Death Valley, in southern Esmeralda county. Placer gold has been found at bedrock for a long distance along the dry bed of the valley in tributary gulches. Water can be made available by pumping from a few feet below the surface.

The scarcity of miners has materially curtailed the scope of work at Jarbidge and the Elkoro company's 300-ton mill is operating at less than half capacity.

LEAD, SOUTH DAKOTA

Accident-Record at Homestake.—Pyrite and Tin Mining.

Lead.—The Homestake company has established a new record in the elimination of accidents. For the first eight months of the present year no fatalities have occurred, while other casualties have been reduced greatly. In view of the fact that a large proportion of the mine labor consists of new men, the result is good. The safety of employees is looked after by an efficient organization, which deserves commendation.

Announcement is made by B. C. Yates, superintendent of the Homestake company, that women will be employed during the period of the War in the lighter surface occupations. This is made necessary by the shortage of labor and will relieve able-bodied men for mine work.

Rapid City.—The State School of Mines has received its second contingent of 124 men to be instructed in mining and telegraphy, also in military affairs. The course covers a period of two months. Barracks and a mess-hall have been erected, and good accommodation is given men that have been inducted into the service.

Deadwood.—Since commencing mining at his property, Olaf Seim has shipped 30 tons of pyrite daily, the total being over 500 tons. Only one eight-hour shift is employed. The orebody is large and carries 38% suplhur.

Hill City.—There has been considerable activity in this district within the past few months, and several tin properties have changed hands. E. C. Johnson of Chicago, who already owns the Gertie mine, has purchased additional ground and will start operations.

The American Tin & Tungsten Co. has completed unwatering the Cowboy mine, and is breaking ore for the mill. This is taken from the 200-ft. level, where the orebody has a length of 77 ft. and a width of 2½ ft. The shoot shows good ore in places. On the 300-ft. level the orebody has a greater length, and stoping will commence soon. A 60-hp. hoist is being erected at the Cowboy mine, and the one used heretofore will be set up at one of the company's other properties. A 20-cu. ft. skip will also replace buckets. The mill has been repaired, and arrangements are now being made to put in a mill to re-grind the jig and table middlings. In addition, an intermediate crusher in the preliminary crushing-plant will be erected, also a slime plant consisting of Deister plato slime tables, Cornish buddles, and rag-frames. The capacity of the mill will be 200 tons per day. It is the intention to make a mill-test of 2000 tons within the next few months and then shut-down for the winter. The development of the mines will be continued, and milling resumed early in the spring. Several hundred tons of ore have already been broken.

Placer mines in Lawrence and Pennington counties in 1917 yielded $924 in gold compared with $2111 in 1916.

VICTORIA, BRITISH COLUMBIA

Platinum and Mica.—Re-opening Mines in Merritt District. —Trail Smelter.

Mining and prospecting for platinum on the Tulameen river, is proceeding briskly, having been stimulated by interest of the Dominion Geological Survey. The Church company, of Tacoma, Washington, is doing a lot of work on the Tulameen above Bear creek. It has erected a big dam, and a flume 200 yd. long. Twenty men with three large centrifugal pumps are working the bed of the river over a distance of 700 ft., and are reported to be recovering considerable platinum and gold. Several smaller outfits are at work. The Government, having established camps at Slate creek, is sinking test holes to bedrock on the bars and benches to determine the value of the ground.

The Donohue Mines Corporation has re-opened its property at Stump lake, Merritt district. Engineers' reports state that the ground is traversed by a series of true fissure veins, all of which assay high in copper, gold, silver, and lead, with some zinc. New machinery and equipment are to be erected, and it is likely that a new concentrator will have to be provided. John D. Leedy, of Seattle, will be the new manager.

Mica deposits in the Cascades, discovered by W. Schmock, are being examined by F. W. Farrier, representing the Munition Resources Commission of Canada, and R. Graham, assistant professor of Mineralogy in McGill University. A feature of the ore receipts at the Consolidated smelter at Trail during the third week of September was 421 tons from the Mandy mine, Flin Flon district, Manitoba.

Fire threatened to destroy the entire plant of the Consolidated M. & S. Co. at Trail recently, but it was got under control with a loss of only $40,000. The Dwight-Lloyd sintering plant was destroyed. This structure was one of the oldest at the smelter, having been erected with hewn timbers 20 years ago. It was soaked with oil. The only explanation of the outbreak given is that the oil temporarily ceased to flow to the furnaces, then re-started without being noticed, resulting in its becoming ignited by the hot furnaces. Re-construction is being hastened. Six electric motors, one of 100 hp., two of 50 hp., the others in smaller sizes, were destroyed and will be the most difficult to replace. It is not thought that the lead plant will be shut-down, as there are old roasters that can be used.

There is every indication that the inquiry into the smelting charges and general policy of the Consolidated M. & S. Co. will commence at an early date. Messrs. Fowler, DeLashmut, and Anderson, three prominent mining men in this Province, who were nominated by the Associated Boards of Trade as being the proper persons to conduct such an investigation, have decided to accept their appointment at the hands of the Dominion government.

NEW YORK

Impressions of the Annual Chemical Exposition.

The fourth National Exposition of Chemical Industries was held at the Grand Central Palace, New York, during the week of September 23. This was probably the last time the building will be open for such a purpose until after the War, as the Government is to use it as a hospital.

With regard to the exhibits it will probably be generally conceded that both the managers of the exposition and the manufacturers and other exhibitors themselves succeeded in excelling last year's effort. All the available space was taken up, and attractions of interest and education seemed to be even in greater variety than in previous instances. This was due in part to the fact that the U. S. Railroad Administration would not agree to any expenditure for exhibits such as were shown by the various companies last year, indicating the resources of the country in those districts reached by the railroads concerned. It was felt in some quarters last year that exhibits of this kind were hardly suitable for such an exposition, although the good done in indicating a greater scope for industrial development was not questioned. The dominant purpose of this year's show seemed, however, less of an attempt to point out possible avenues of development of resources; and was, rather, a distinctly successful advertisement of the notable achievements of the country's chemists and manufacturers in entirely and successfully replacing foreign-made products with those of American manufacture. The loss of the railroad exhibits was, therefore, not noticeable as far as the general success of the exposition was concerned. Had much space been devoted to showing the resources of the country, in this way, a number of exhibits illustrating the present-day vitality of American progress would have, necessarily, been crowded out.

The successful development of the dyeing and ceramic industries naturally featured largely, and attracted a considerable amount of attention. Among exhibits of particular interest, on account of their novelty, was the booth under the direction of the Chemical War Service, where gas-masks and other interesting war appliances were on view; a panorama scene arranged by the Solvay Process Co., depicting a modern battlefield, with an exhibit of the company's products alongside and information as to their particular use in warfare; samples of ferro-chrome-zirconium and ferro-zirconium produced by the General Electric Co.'s equipment; a model sprinkler-system designed by the General Fire Extinguisher Co., in periodic operation; and many others. Striking though familiar exhibits included the enormous apparatus from the Buffalo Foundry & Machine Co.; an extensive display of products from the factories of the E. I. Du Pont de Nemours Co.; a number of new models of 'duriron' castings, and other makes of acid-resisting metal; excellent displays of metals and other products by the Anaconda Copper Mining Co., the American Metal Co., the Raritan Copper Works, the New Jersey Zinc Co., the Nichols Copper Co., and many others. A number of booths displayed varieties of precision instruments and recording apparatus of many kinds. Filtration equipment on view showed that little change in design or construction had been made in standard types during the year. A zenith revolving-drum filter formed part of a particularly neatly-arranged and well-designed model plant, and attracted considerable attention.

The addresses delivered during the week centred around the subject of the development of the chemical and metallurgical industries in the United States, particularly with reference to the war period since July 1914. The meetings were well attended, and much interest was displayed in the details of technical development portrayed by the speakers.

The fifth exposition is to be held at Chicago on September 22, 1919.

CHICAGO, ILLINOIS

Further Notes on the Bankers Convention.

The full resolution endorsing aid to the gold miners, passed by the convention of the American Bankers' Association on September 27, was abbreviated in the report sent by wire. Nevertheless, the essential features were preserved. The missing preambles were the following:

"Whereas this decline in production is due entirely to the fact that the cost of producing the gold-ounce as a commodity has exceeded the fixed price of $20.6718 per ounce, and

Whereas, the Secretary of the Treasury of the United States has stated that, next to food and ammunition, gold is the one most needed war-essential."

Aside from this, the resolutions, as printed in the 'Mining and Scientific Press' on October 5, were complete and correct. The importance of the position taken by the miners at the American Gold Conference at Reno was shown by addresses clearly stating that under no circumstances could the bankers endorse a program that involved any alteration in the standard gold-unit measure of value. One prominent delegate expressed the prevalent sentiment when he said: "If this resolution is intended for the purpose of providing an adequate wage to the gold-miner equal to every other miner, and if it is intended for the purpose of bringing returns on the capital invested in gold-mining enterprises equal to the return on other mining enterprises, then I favor it. If it is intended to provide a higher price for hoarded gold, whether coined or bullion, I oppose it (applause) for the reason that the National banks have been compelled to transport their gold-reserves to the Federal Reserve Bank, and the State banks have willingly handed over their gold-reserve, and we do not want any gold hoarder to make any money on a premium upon gold not now in public circulation." Eugene Davis, in his argument for support to the gold industry, said:

"The conditions that are so greatly intensifying the necessity of additional gold to strengthen and extend the foundation of our expanding credit-structure are causing an alarming decrease in gold production. The value of gold as a commodity having been fixed by law, its price remains stationary, while the cost of everything employed in its production has greatly advanced. The increased cost of labor is from 33% to 50%, with a decrease of from 40% to 60% in efficiency. Freight and smelter-charges have advanced fully 25%, while the cost of supplies has risen from 100% to 300%. The great deposits of gold-bearing ores are low in grade, and in normal times can at best be made to yield but a small profit by operating on a large scale and employing the most economical methods of treatment. For these mines to cease production means not merely a temporary loss of the normal output; in a majority of cases it means the permanent loss of the mines and of the gold locked up in them, for, once filled with water, allowed to cave and the equipment to deteriorate, the cost of re-opening would be so great as to be prohibitive."

Lively discussion ensued in regard to the attitude of the State banks, which had been severely criticized by Comptroller of the Treasury, John Skelton Williams. This brought a return-fine upon Mr. Williams at the convention, but the tempest was calmed by a rational resolution passed by the State Bank Section of the convention, advocating the shipment of all the gold-holdings of the State banks to the Federal Reserve banks, "where only it is of value in providing note-issues and in upholding the monetary and general financial structure of the country." Further resolutions indicated a tendency of the State banks to increase the number becoming member-banks in the Federal Reserve system.

ARIZONA

Clifton.—The Arizona Copper Co. has issued a statement showing results of the half-year ended March 31, 1918. The profit was £326,560 ($1,569,000), less taxes, etc., but plus revenue from other companies, making £257,098 ($1,234,000) net. From this was deducted interest on debentures, and reserve accounts, leaving £143,102 ($686,400). Dividends on preferred shares amounted to £12,266 ($58,000). On August 31, 1918, a dividend of 1s. 6d. (36 cents), amounting to £113,992 ($547,000) was paid on the ordinary shares. The balance on hand is £30,581 ($144,000). All the outstanding bonds were redeemed on March 25, leaving the company free of debenture debt. The output during the period was 7896 short tons of copper. The strike in 1917 affected operations, and although work was resumed in November, the normal output was not attained until March.

Globe.—The Superior & Boston Copper Co. has issued a report by Walter Osborn, mining engineer, and one by the superintendent, A. L. Graham. Mining operations in this property came under two main divisions; the first in the known orebodies above 800 ft., the second is exploration at depth to find sulphide ore. The Great Eastern, the principal lode, has been explored for a lateral distance of 2500 ft. It is mineralized for the whole length. In many places the copper is badly leached, only the iron remaining. Lenses of oxide ore occur, from a few inches to 20 ft. in width. The lode is badly faulted, but this trouble is understood. The lode is persistent and maintains a width of 30 to 40 ft. Careful exploration is necessary to find the good ore. A recent discovery is that of a body 100 ft. above the 800-ft. level, in the east end of the mine. It has been opened for 90 ft., and is 20 ft. wide, averaging 6% copper so far. This lens has important possibilities. The future of the mine lies in finding sulphides, so the 1200-ft. level is to be extended under the orebodies and under the leached portions of the lode in the east end.

Johnson.—The August output of the Johnson district approximated 5000 tons of 4% copper ore.——The Peabody Consolidated is preparing to resume development.——The output from the Dragoon Mountains Copper Co., for August, was 11 cars. New ore has been opened on the 400-ft. level. ——The McKay lessees on the Arizona United property are shipping 6 to 8 cars per month.

Miami.—Inspiration Consolidated pays $2 per share, $2,363,934, on October 28. This makes $6 for the current year.

Oatman.—The Oatman Bureau of Mines has sent a marked copy of the 'Oatman Mining News' to the 'Mining and Scientific Press'. The headline is: "Big strike in Arizona Mossback, puts Oatman on the map as world's greatest gold camp." This is followed by "W. H. Halcom, of the directorate, withholds announcement until all elements of doubt had been eliminated. $25,500,000 worth of $25 ore in sight with stupendous reserve body that will keep 300 ton mill busy for years. Value up to $10,000 a ton with plenty of $500 and $700 ore for anyone to see and examine. No stock for sale, so there's nothing to exploit but the truth." The Oatman Bureau of Mines, wishing to correct this, noted that 'Halcom' should be 'Holcomb'; the word 'had' should be 'have', and '$25,500,000' dwindles to '$2,500,000'. Exaggerations from Oatman have been commented upon editorially in this journal during the boom there, and more of it will do Oatman no good. The Arizona Mossback Mines Co. is sinking to 500 ft., the shaft being 435 ft. deep at present. This mine has been worked for 17 years, during which time 1700 ft. of work was done to the 300-ft. level. The present owners unwatered the workings during July of 1918, and started sinking in August. It is now estimated that reserves are 100,000 tons of $25 ore. The 'pay' orebody so far is said to be 18 ft. wide on the 50-ft. level, 25 ft. on 120 ft., 45 ft. on 200 ft., and 67 ft. on 300 ft. On the dump is 3000 tons, in which free gold is reported as visible. A 200 or 300-ton mill is being designed, to be in operation by mid-1919. C. W. Maier is president and general manager and J. Lamb superintendent.

Superior.—The Grand Pacific Copper Co. will ship 300 tons of copper ore during September, compared with 150 tons in August. The ore-shoot that was opened on the first and second levels has been developed 175 ft. below the second, exposing commercial ore. The copper ore occurs in a cross vein cutting the bedding rocks at right angles, conditions closely paralleling those of the Magma mine.

CALIFORNIA

Blythe.—There is reported to be some activity near this place in Riverside county. W. A. Hanson and W. Villman have a property from which, according to the Riverside 'Enterprise', assays return high content in nearly all the metals.

French Gulch.—A hoist, costing the Gladstone mine $13,000 five years ago, and used for three years, has been sold and shipped to the Tintic Standard Mining Co. at Eureka, Utah. The purchaser paid exactly what the hoist cost originally, also $2000 for removing it from the mine, where it was at the inner end of a 3600-ft. tunnel. The purchaser must also pay the freight to Utah. The hoist and its accessories weigh 50 tons.

San Jose.—The so-called 'meteor' in Alum Rock park, 6 miles from this place, has been sampled by the city authorities and found to assay 53% manganese. It is thought that there is between six hundred and several thousand tons of ore available. The city manager, E. Bailey, has been in touch with L. H. Duschak of the U. S. Bureau of Mines and G. D. Louderback of the University of California regarding disposal of the ore.

Winthrop.—The flotation plant at the Bully Hill mine will be started about the end of October. Additional housing accommodations must be provided for the extra men who will then be employed. The Bully Hill mines are now employing 90 men. Ore shipments are made regularly to the smelter at Kennett.

IDAHO

Cascade.—Quicksilver and antimony deposits in central Idaho have been examined recently by the State Inspector of Mines, R. N. Bell. The mercury deposits are situated along the eastern border of the Yellow Pine district, formerly in Idaho but now in Valley county. This part of the

district is entirely embraced within the drainage-area of the east fork of the south fork of Salmon river, and is approached from Cascade on the Oregon Short Line over the old Thunder Mountain road that was built by State and private capital during the Thunder Mountain boom of 15 years ago. The distance from Cascade to the Fern mine, which is the centre of the present activity, is a little over 70 miles. Of this distance, the first 30 miles to Knox, and in fact to Cabin Creek summit, 6 miles beyond Knox, is within the Payette national forest, and has received some support from that Government department in maintenance of the wagon-road which is now barely passable for auto travel, as far as Knox. From that point it is 40 miles to the quicksilver district, over the most atrocious excuse for a wagon-road in the State. Freighters refuse to contract delivery, but work by the day, charging $8 or $10, according to the quality of the team, with food furnished for man and horses and a demand of 8 or 10 days for the round trip, which, with the present high cost of horse-feed, brings the cost of delivered freight to the district to approximately $100 per ton. The elevation of the road is from 4700 ft. at Cascade to 9000 ft. near the Fern mine. The region is well watered and timbered. Mr. Bell discusses the geologic features as exposed. The Fern company has done a fair amount of work. Three or four men are extracting ore from the surface and a tunnel. The furnace is of the old Johnson-McKay type, consisting of 12 cylinders 12 in. diameter and 6 ft. long, fitted with condensing apparatus. Each holds 150 lb. of ore. The furnace is fired with wood. C. H. Richmond of California is in charge of this plant, which has a daily capacity of 3 tons of ore, carrying 5% mercury. The Yellow Pine company's claims adjoin those of the Fern. Other operators are the Idaho Quicksilver Mines, and Chief, controlled by Boise people. One of the most promising cinnabar claims is that of Pringle Smith, situated north of the Gold King mine on Thunder mountain. This was the first discovery of mercury in the district, 15 years ago. The Hennessy property, a mile south-west of the Smith, is considered worth watching. Near this cinnabar is some promising antimony deposits. Twenty miles north-west of the Fern quicksilver mine is the Yellow Pine antimony mine. Here a 25-ton plant is being erected by the Frank Nowak Co. of Chicago. The American Continuous Retort Co. of Denver is supplying the equipment.

Kellogg.—Grant Smith & Co. of Portland, Oregon, has been awarded the contract for completing the Pine Creek branch of the O.-W. R. & N. Co. Some of the grading has been done. Four or five miles can be laid before snow falls. This line will enable the Constitution, Douglas, Highland-Surprise, Nabob, and other mines to ship ore.

Mullan.—John A. Percival has opened a tungsten deposit 150 ft. across, said to average 15% WO_3, but large samples assayed much higher. This property lies a few miles north of the Consolidated Interstate-Callahan mine, of which Mr. Percival is president.

KANSAS

Cherryvale.—The Edgar Zinc Co. has started operating its smelter here at full capacity again, having been at half capacity during the summer. The plant has 4800 retorts.

MISSOURI

Joplin.—Production of the Tri-State region last week totaled 9663 tons of blende, 534 tons of calamine, and 1432 tons of lead. These averaged $58, $40, and $100 per ton, respectively. The total value was $708,660, of which Missouri contributed $131,498.

MONTANA

Butte.—The 'Miner' of September 29 says that the I. W. W. agreed to resume work in the mines and the strike that was called on the 12th is ended. This action was taken on the 28th at a closed meeting of Metal Mine Workers' Union, local No. 800 of the I. W. W., when members of that body agreed to return to the mines, pending Federal adjustment of their grievances. At the conclusion of the meeting, Federal agents asserted that they had unveiled a plot said to have been hatched by I. W. W. leaders, which, the officers said, would result in a riot.

It was alleged by Government men that the men were urged to besiege the Federal employment bureau and demand Government rustling-cards. The Federal mediator, Tom Barker, explained that the Government rustling-card has not been accepted by organized labor and has not been adopted at the Butte mines. He declared that leaders who had urged I. W. W. to demand rustling-cards from the employment bureau had deliberately and maliciously attempted to fan the fires of discontent. Federal agents are adopting measures calculated to suppress any trouble and promptly quell any disturbances Monday mroning, for it is feared that many illiterate members of the I. W. W. have accepted these alleged statements relative to a purported employment card for the one now used by the mining companies, of the leaders as the truth. Although the mining operators of the Butte district have offered to adopt the Government rustling-card, the American Federation of Labor must be consulted before this form of employment card is accepted. In his report to Washington officials Mr. Barker has requested that the local situation be given the earliest possible consideration. B. K. Wheeler, United States district attorney, addressed a letter of rebuke to D. M. Kelly, counsel for the Anaconda Copper Mining Co., who is alleged to have said that the local Federal authorities have failed to enforce certain laws and thus have made Butte a haven of refuge for the members of the I. W. W. organization and for persons classed by him as the radical element.

The Tuolumne company is to absorb the Colusa-Leonard company on the basis of one share of the former for four of the latter. For some time the Tuolumne has been in control of the Colusa. The output in August was 2700 tons, but at present daily shipments are 100 tons. The 800-ft. level is opening well.

The Butte East Slope company is preparing to resume operations. The ore in the oxidized zone carries gold and copper. E. P. Lomas is manager.

Hassel.—The Iron Mask mine in Broadwater county, has been developed to 375 ft. It formerly yielded manganese-iron ore. A rich streak of steel galena has been found a few inches from an old drift. The shoot is 120 ft. long and of unknown height.

Helena.—Drifts on the 400-ft. level of the Helena mine have disclosed 2 ft. of galena, valued at over $30 per ton. The mine is owned and operated by the Cruse Developing Company.

Rimine.—After opening old workings of the Lee Mountain mine and shipping 37 cars of ore to smelter, this mine is closed. There is plenty of ore available.

Saltese.—The St. Lawrence Copper Mining Co.'s property was recently visited by Eastern shareholders. Considerable development is under way, in charge of H. M. Lancaster. A new road has been constructed to enable traffic to continue through the winter.

NEVADA

Carson.—On October 15, Raymond T. Baker will confer with Western assayers to discuss the precious-metal industry.

Goldfield.—The Reorganized Blue Bull Mining Co. has issued a statement covering the year ended August 31, 1918. On the 700-ft. level of the Hat shaft a total of 1800 ft. of openings have been made, including work in the Victor claim of the C. O. D. company. On the veins found

800 ft. was driven. As the ore was not in commercial quantity, work was stopped. The Simmerone shaft was then prepared for exploration in the north end of the property. On the 100-ft. level, a vein 6 to 18 in. wide, assaying from $100 to $800 per ton, was opened. From a winze, 21 tons of $117.29 ore was sent to the smelter. By raising from the 250-ft. level, and connecting with the winze, the ore-shoot was found to be 50 ft. long, 6 to 18 in. wide, worth $100 per ton in gold, silver, and copper. Expenses were $1000 monthly during the past 16 months. Assessment No. 7, of 1c. per share, has been levied.

Tonopah.—The West End Consolidated pays 10c. per share on October 16. This is equal to $178,849, and makes $357,698 for the current year.

The Tonopah Mining Co. pays 15c. per share, equal to $150,000, on October 21.

Virginia City.—The Mexican Gold & Silver company has levied an assessment of 10c. per share, due October 23. This will realize $20,160.

NEW MEXICO

Steeplerock.—After a suspension of operations, the Carlisle mine and mill have been re-started. A New York syndicate had an option on the property, but gave it up.

OKLAHOMA

Picher.—Production of the districts last week totaled 7493 tons of blende and 1177 tons of lead, valued at $543,322.

Miami.—The ore-warehouse project is said to be worrying smelter-men, who think that they may have to buy concentrate in the open market and so pay a higher price. The warehouse at Picher will be finished in 30 days, while one at Douthat has been started. The Oklahoma Mining Exchange is the 'father' of this scheme. The Oklahoma Ore Producers' Association, of Picher, favors the idea and is advising mine-owners to send their products to the warehouses.

OREGON

Baker.—S. L. Shonts, of Wallace, Idaho, has recently returned from an investigation of the chrome deposits of eastern Oregon—Grant, Baker, and Willowa counties. The chief producers are in Grant, centring around Canyon City, Prairie City, and John Day, old gold placer districts. Most of the mines are 10 to 20 miles from rail; a few are 40 miles. Freight to the East is $16 per ton. It is estimated that these counties have yielded 11,000 tons in 9 months, and should total 18,000 tons for the year.

Grants Pass.—The Oregon Chrome Mine, in charge of H. Sordy, reports that the road from the property to Waters Creek is complete. Auto-trucks are ready to haul chrome to rail. Supplies were formerly packed in by way of Galice, but that route is now to be discontinued in favor of the easier and quicker road from Grants Pass.

SOUTH DAKOTA

Deadwood.—A contract has been let by W. E. Elder and others for the driving of a 1200-ft. tunnel in the Carbonate district. It is claimed that there are rich silver lodes in the ground to be opened.

UTAH

American Fork.—Development in this region is hampered by lack of labor. The Bay State and Miller Hill mines have been closed.

Eureka.—The Eureka Bullion mine has been examined by J. H. Weber. The shaft is 825 ft. deep. At 138 ft. the vein was found, being 12 ft. wide, assaying 28% iron, some gold, silver, lead, manganese, and calcite. The vein shows the pay-ore has been leached deeper, but it proves the larger north and south vein which makes the big orebodies.

Lark.—The Ohio Copper Co.'s mill, which was considerably damaged by fire during August, was expected to start again early in October.

Park City.—This district produced 8285 tons of ore and concentrate during September. The list of shippers is as under:

Mine	Tons
Judge	2863
Ontario	2080
Silver King Coalition	1503
Daly West	720
Daly Mining	541
Naildriver	45
Creek jiggers	33
Miscellaneous	500

Daly West is to increase its capital from 180,000 to 250,000 shares. The par value is $20. A connection between the new cross-cut and shaft is expected at an early date. Lessees mined 184 tons of $55.64 ore in August.

The Daly Mining Company pays 10 cents per share, equal to $15,000, on October 1. This makes a total of $3,030,000. The weekly output is from 80 to 200 tons of ore.

Tintic.—Ore production of companies and lessees during September totaled 30,000 tons, a little better than in August and July. Dragon Consolidated headed the list with 7500 tons, followed by Chief Consolidated with 5500 tons, Iron Blossom with 2500 tons, Tintic Standard with 2500 tons, and Centennial Eureka with 2400 tons.

Silver production of Chief Consolidated was 1,328,968 oz. for the first half of 1918, nearly as much as for all 1917.

WASHINGTON

Northport.—The Electric Point lead mine near here has finished erecting its aerial tram, and probably will increase its daily output from 40 to 100 tons.

Silver Hill.—A promising tin property is being developed here, 11 miles from Spokane. The property is owned by John A. Percival, president of the Consolidated Interstate-Callahan Mining Co. of Idaho.

CANADA

British Columbia

Atlin.—Near this place is an immense deposit of magnesite, which has been examined in the past by Canadian geologists. So far it has not been exploited, because of the distance from points of consumption. The ore would have to be hauled a long way and trans-shipped several times.

The Gold Commissioner for this district reports that on Pine creek the Columbian Mines Co. operated with 40 men last year, in charge of P. W. Greyer. Work has since been stopped on account of judgments against the concern. It is said that at a sheriff's sale, 52 claims and an immense quantity of equipment were sold for $62. Wages are owing to miners, and the whole affair is considerably mixed.

Britannia.—The Howe Sound Co. pays 5c. per share on October 15. This amounts to $99,207.

Fernie.—On September 21 there were 1200 coal miners out on strike in this district. They demanded the introduction of the single-shift system in the Crow's Nest Pass collieries on account of certain dangers. If the 9000 men employed walk-out, it will be serious for the metal-mining industry.

Hedley.—The Hedley Gold Mining Co. paid a dividend of 15c. per share on September 30.

Rossland.—The Granby Consolidated is preparing to extract ore from its Velvet copper-gold mine. Fifty men are employed.

The chrome belt west of Rossland is said to show good indications.

Slocan.—The Rambler-Cariboo Mining Co. had a surplus of $29,120 on August 3, plus ore in transit valued at $21,000. Present profits are $2000 monthly. The mill is working one shift on account of lack of men. W. A. Cameron is superintendent.

Ontario

Boston Creek.—The new railroad station here is complete. Telegraphic service is also available.

Cobalt.—Nipissing Mines Co. pays a dividend of 10% on October 21.

The Edwards-Wright company, operating the Green-Meehan mine, in which high-grade ore was opened at 240 ft., has decided to sink deeper.

At the Genesee water has retarded operations, and more pumps are being installed.

The McKinley-Darragh has cut high-grade ore in its Savage mine.

The Beaver is taking out high-grade ore from the 300 and 400-ft. levels, and has discovered ore 28 ft. wide in the diabase on the 500-ft. level.

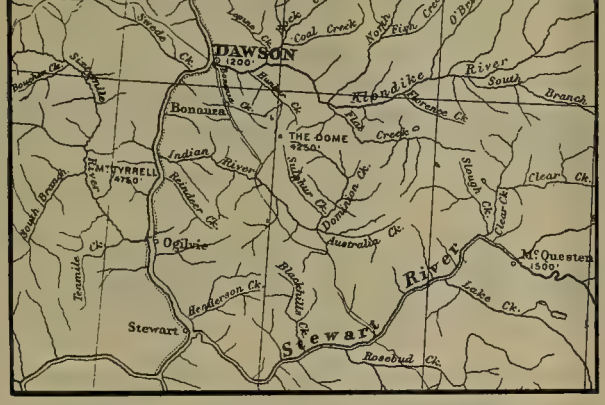
La Rose has opened a rich vein in the Violet property at a depth of 410 feet.

Kirkland Lake.—The 150-ton mill for the Wright-Hargreaves company is to be designed by James Grant of the McIntyre-Porcupine company.

Lake Shore yielded $44,000 from 1732 tons during August. Since the mill started in March it has treated 9393 tons worth $236,049.

Yukon

Dawson.—Alfred Thompson, member for the Yukon, who is at Ottawa, stated that it is his intention to ask Parliament at its next session as a war measure, to remove the royalty on gold produced in the Yukon. This can be done by passing the necessary amendments to the Yukon Placer Mining Act. He considers that his proposal would be in the best interests of the Allies in view of the desirability of increasing gold production, and the suggestion which has been made in some quarters that a bonus should be given to encourage gold mining.



PRINCIPAL PRODUCTIVE AREA OF THE KLONDIKE

The Yukon Gold Co., operating dredges at Dawson, in Alaska, Idaho, and California, and a mine in Nevada, has suspended dividend payments. The estimate of income for 1918 is a disappointment, due to causes affecting all gold producers. Owing to shortage of power in California, the company's operations have been curtailed.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

John P Gray, of Idaho, is here.

Horace V. Winchell was in San Francisco this week.

Marion L. Thomas has returned to New York from Cuba.

E. A. Julian, manager for the Goldfield Consolidated, is at Reno.

J. C. Martin has returned from Valdez, Alaska, to San Francisco.

John W. Mercier sailed from New York to Europe on September 25.

C. V. Hoskins, manager of the Jerome Verde mine, is here from Arizona.

Carl Trischka is at the Engineer Officers Training School at Camp Humphreys, Virginia.

C. A. Filteau has been appointed manager of the Peterson Lake mine at Cobalt, Ontario.

Duncan MacVichie of Salt Lake City has returned to his home from a visit to Yerington, Nevada.

L. S. Cates, manager of the Ray mine, is serving on the Draft Appeal Board at Phoenix, Arizona.

Norman Carmichael is serving as chairman of the United War Work Campaign at Phoenix, Arizona.

E. R. Abadie, Jr., has been appointed superintendent of the Golden Center mine at Grass Valley, California.

B. R. Brown has been made superintendent of the La Grange mine, to succeed **Louis Webb**, who has resigned.

T. E. Mitchell, until recently general manager for the Burma Mines, Ltd., is here on his way from Burma to London.

Stanley C. Sears has received his commission as Captain of Engineers, U. S. Army, and is stationed at Camp Humphreys, Virginia.

W. J. Loring, engineer representing Bewick, Moreing & Co. of London, has been at Mill City, Nevada, supervising the construction of a tungsten mill.

J. K. Turner, engineer in charge of several Goldfield properties, is at Reno attending a session of the Federal District Draft Board, of which he is a member.

Dwight Garrison, Lieutenant in the Coast Artillery and the son of F. L. Garrison, of Philadelphia, is now stationed at Fort Winfield Scott, near San Francisco.

George E. Bowen, of Leadville, Colorado, has obtained a commission as First Lieutenant, Engineer Officers Reserve Corps, and is now at Camp Humphreys, Virginia.

Frank Wilson, formerly connected with the Syndicate Mining Co., Masbate, P. I., has accepted a position with the Mexican Candelaria Co., S. A., of Sinaloa, Mexico.

W. A. Bradley, manager for the Pittsburgh Silver Peak Gold Mining Co., has been at Tonopah. His company has abandoned the Rawhide mine on the Mother Lode.

C. D. Kaeding, manager for the Dome Mines, of Porcupine, has been in the Mason Valley district, Nevada, and was among the first to be taken in the new draft at Reno.

James F. Kemp, Waldemar Lindgren, A. C. Lawson, Walter Wiley, and **Reno Sales** are at Bingham, preparing evidence for the three apex cases that are impending.

E. C. Hickman, metallurgist for the A. S. & R. Co. at Murray, Utah, has resigned to accept a position as assistant superintendent for the St. Joseph Lead Co. at Herculaneum, Missouri.

J. W. Moffet, many years manager of the Beaver Consolidated at Cobalt, Ontario, has resigned owing to ill health. He is succeeded by **L. W. Ledyard**, recently manager of the Teck-Hughes at Kirkland Lake.

THE METAL MARKET

METAL PRICES

San Francisco, October 8

Aluminum-dust, large and small lots, cents per lb.	65—70
Antimony (wholesale), cents per pound	15
Copper, electrolytic, cents per pound, in carload lots	26.00
Copper, electrolytic, cents per pound, in small quantities	27.35
Lead, pig, cents per pound	8.30—8.80
Platinum, Government price, per ounce	$105
Quicksilver, per flask of 75 lb.	$120
Spelter, cents per pound	12
Zinc-dust, cents per pound	15

ORE PRICES

October 8

Antimony, 45% metal, f.o.b. California, per unit	$1.10
Chrome, 38 to 48%, California, per unit	$1.25—$1.50
Fluorspar, 85% CaF_2, f.o.b. shipping point, or San Francisco, per ton	$22—$30
Magnesite, crude, California, per ton (nominal price)	$7.00—8.00
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 45%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 85% MoS_2	$1.00
Pyrite, per unit of sulphur, cents	28—32
Tungsten, 60% WO_3, per unit	$20—$25

EASTERN METAL MARKET

(By wire from New York)

October 8.—Copper and lead are unchanged. Spelter is dull and lower.

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government has fixed its maximum at 48.81 pence for metal 925 fine.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.35c., respectively, until August 15. On August 7 the current rates were again fixed until November 1, prices to be effective on the day of shipment, not the day of sale.

Quotations in cents per pound are as under:

The price-fixing committee of the War Industries Board and producers are to confer on copper prices from October 15 to 20.

Owing to shortage of labor, refineries are said to be behind production.

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. This is to be continued until January 1, 1919, the price at point of delivery to be at East St. Louis plus freight. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefor $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds.

TIN

Prices in New York, in cents per pound. The monthly averages in 1918 are nominal. Under the new international agreement, the United States is to get 66% of the world's supply of tin.

Monthly averages

	1916	1917	1918		1916	1917	1918
Jan.	41.76	44.10	85.13	July	38.37	62.60	93.00
Feb.	42.60	51.47	85.00	Aug.	38.88	62.53	91.33

May	49.10	63.21	100.01	Nov.	44.12	74.18	....
June	42.07	61.93	91.00	Dec.	42.55	85.00	....

Tin imports into the United States in seven months of 1918 totaled 53,027 tons. This is at the rate of 81,163 tons per annum, closely tallying with the 80,000 tons to be allocated this country, as determined by the Inter-Allied Tin Conference at London. Of the tin imports, 17% come in as concentrate, against 13% for the whole of the last fiscal year.

Ferro-manganese: The Sub-Committee on Ferro-alloys has sent notices to importers of the British alloy that any further imports will probably be impossible, as it is felt that British blast-furnaces can better devote any excess capacity to making pig-iron, which is scarce both in Great Britain and the United States, and also because the United States can supply its own needs in ferro-manganese as well as those of Canada. This means that this country will probably export to Canada instead of the alloy coming from Great Britain. The quotation is unchanged at $2.50 per unit for 70% alloy, with $3.50 per unit added and subtracted above and below the standard. Probably this could be shaded on a good inquiry.

Eastern Metal Market

New York, October 2.

The markets are all quiet and transactions in those where an open market prevails have been small. There have been no startling developments, but in view of the war situation some may spring up any day.

Copper production presents a somewhat more encouraging aspect, but the effect on the market produced by the new draft on the labor situation is watched with interest.

Tin business has almost come to a stop, but prices are a little stiffer.

Lead supplies continue meager, with the control of all avenues of the trade very tight.

Zinc is inactive and the trading of the market has been softer each day.

Antimony is a little stronger.

The most interesting announcement in the steel industry is that of the United States Steel Corporation which last week stated in a special bulletin that after October 1 the basic 8-hour day would be effective in computing all wages of employees. This amounts to another increase in wages, since men working 12 hours continuously will receive six hours' pay for four hours of overtime, which means a 16⅔% advance. It is expected that independent steel-makers will follow in the new departure. An advance in freight rates, amounting to nearly 10%, will become effective by November 1, applying to New England and generally to points east of Pittsburgh. Steel production in September has exceeded that for August, with two days less for working.

COPPER

How the draft will affect the labor situation is an absorbing topic. It is likely that miners of copper and workers in refineries will be accorded special consideration, as the labor supply, particularly of the right sort, is by no means ample, and copper is a decided war necessity. The refinery situation as to labor is expected to be better as the cooler weather comes on. The output of crude copper seems to have been better in August than in July and also than in August a year ago. The output of 16 domestic and 4 foreign prominent mines in August is put at 151,790,000 lb., as against 151,359,000 lb. in July. The total for the eight months ended August 31, 1918, is estimated at 1,230,042,896 lb., or about 50,000,000 lb. in excess of that for the same eight months a year ago. The price question is looming up. The present 26c. price holds until November 1, and the new one, if any change is made, will probably be decided by October 15. That is the expectation which is quite general now. July imports of copper are placed at 16,500 tons, making the total for the seven months 130,000 tons, as compared with 144,000 tons to August 1, 1917. Casting copper, as well as jobbing lots of refined copper, are said to be selling under the fixed maximum of 27.35c. per lb. This is regarded by some as significant, pointing to a greatly lessened domestic demand for ordinary non-war purposes. The demand for raw copper, as well as for brass from Europe, is heavy.

TIN

Again there is nothing official or otherwise to report regarding the international situation. The proposition to control the distribution and price of tin by means of an International Executive Tin Committee, sitting in London, is understood to have been settled, and announcements to this effect have come from Washington, but details as to the working-plans are still unknown. It is said that the Dutch and Chinese have not fallen in line and are still maintaining high quotations. Neither is anything known yet as to the fate of American importers. They are still on the anxious-seat as to their future life-work, but continue to report on the job each day. About the actual market there is little to say this week. There have been sales of small lots of all the grades of tin available for nearby delivery; but it is in the market for future delivery where the big business is usually done; this market, however, has been dead. Consumers are still refraining from entering the market. For November shipment from the Straits probably 71.25c. per lb. could be done. The spot and early-delivery market is again higher at 82c. per lb., New York, nominal, but the quantity available is very small. Arrivals at Pacific ports to September 25 have been 3620 tons and at Atlantic ports 1025 tons to September 30. The London market continues to fall, with spot Straits quoted yesterday at £337 10s. per ton, against £340 10s. a week ago.

LEAD

The lead market has settled to one of routine. All the metal available, every ton and even every pound, is under the strict control of the Lead Producers' Committee as to distribution and price, the latter being fixed by agreement at 7.75c. per lb., St. Louis, or 8.05c., New York. Everywhere one hears nothing but commendation for the manner in which this committee is handling such a difficult situation, which was made especially hard by the scarcity of the metal. There is at present no relief in sight on this score. Imports of lead, as well as exports, have been larger this year than last. The total imports to August 1, 1918, have been 52,473 gross tons, against 34,482 tons in the same seven months last year.

ZINC

The market continues easy, with the demand exceedingly light for domestic consumption, but there are rumors that fairly large inquiries for foreign account are shortly to appear. Consumers do not seem interested, nor do sellers appear anxious. The market has gradually declined, each day nearly, in the week, until yesterday prime Western for October or early delivery was quoted at 9.05c., St. Louis, or 9.40c., New York. Spot delivery was generally held at 9.15c., St. Louis, or 9.50c., New York. For November-December shipment the quotation was fairly firm at 8.90c., St. Louis, or 9.30c., New York. For grade A zinc 12c. per lb. base is still the Government maximum price. According to the Government's weekly report of output and stocks of zinc, the former had increased about 600 tons in the week, and the latter has decreased about 700 tons.

ANTIMONY

The tone of the market is stronger and the quotation for wholesale lots for early delivery is 14c., duty paid, New York. There has been some bidding among dealers.

ALUMINUM

Government maximum prices control the market for No. 1 virgin metal, 98 to 99% pure and for scrap at 33c. per lb. for 50-ton lots, at 33.10c. per lb. for 15 to 50-ton lots, and at 33.20c. per lb. for 1 to 15-ton lots.

ORES

Antimony: No developments again in this metal.

Molybdenum: Prices are nominal at $1.25 to $1.50 per lb. of MoS_2 in 90% material. Government orders are a possibility.

Company Reports

GOLDEN HORSE-SHOE ESTATES CO., LTD.

Property: mine and mills at Kalgoorlie, Western Australia, one of the most important in Australia.

Operating Official: J. W. Sutherland, general manager.

Financial Statement: bullion and sundries in 1917 realized £413,581 ($1,990,000). The profit was £100,797 ($487,000).

Dividends: two, No. 41 and 42, amounted to £82,500 ($398,000), making £3,375,000 ($16,200,000) to date.

Development: there was 6310 ft. of new work done, making 163,996 ft. to date. Last year 3862 ft. was in ore. The main shaft is 3252 ft. deep, and No. 2, 2513 ft. deep. No. 4 lode at 3140 ft. is showing good ore. Reserves total 748,352 tons, assaying $9.58 per ton, an increase of 40,000 tons. Three lodes contain all save 7055 tons of this.

Production: an average of 90 stamps crushed 176,028 tons of 51s.8d. ($12.40) ore. The sand, slime, and concentrate plants treated 49,488, 109,844, and 16,696 tons, respectively, extracting 89.4% of the total gold. Fine gold sold was 95,660 oz. Since 1899, 3,876,043 tons have yielded 2,509,586 ounces.

Costs:

Mining	$3.08
Milling (crushing, stamping, classifying, concentrating, and fine grinding	1.53
Total at mine, excluding development	6.84
Sand treatment (percolation)	0.92
Slime treatment (settling, agitating, filter-pressing, etc.)	1.84
Concentrate treatment (roasting, grinding, filter-pressing, etc.)	3.50

CHILE COPPER CO.

Chile Exploration Co.

Property: extensive property and works at Chuquicamata, Chile.

Operating Officials: H. C. Bellinger, general manager; B. T. Colley, manager of welfare department. Consulting engineers, Fred Hellmann, mining; E. A. Cappelen Smith, metallurgical; H. A. Guess, milling; P. H. Thomas, electrical; Fred Sargent, power; and S. B. Williamson, construction engineer.

Financial Statement: results in 1917 may be tabulated as under:

Sales of copper	$18,908,855
Operating charges	11,751,778
Interest and taxes	2,365,758
Plant, ore depletion, discount, etc.	2,842,202
Surplus, including $649,294 miscellaneous income	2,598,411
Balance from 1916	1,790,218
Total surplus	4,388,629
Less adjustments, depletion, plant	3,786,511
Net surplus to 1918	602,118
Current assets, including cash, metal, supplies, investments	21,654,877
Current liabilities, including depletion reserve and surplus, less unamortized discount on bonds	8,392,853

Development: prospect drilling amounted to 1842 ft., against 9519 ft. in 1916. Two holes were put down 737 and 1165 ft., respectively, to determine the southern limits of the orebody. There was no ore at this point. Further prospecting has been suspended. Total drilling is 60,786 ft. Reserves of positive and probable ore amount to 700,000,000 tons, averaging 2.12% copper.

Production: the past two years compare as follows:

Year	Tons leached	Per day, tons	Copper, %	Recovery, %	Copper, lb.
1917	2,904,191	8067	1.757	81.80	88,370,000
1916	1,739,812	4887	1.720	77.70	42,688,000
1915*	625,394	....	1.710	66.87	10,944,000

*7½ months.

Plant: eight electric and steam-shovels are now in operation, also eight locomotives, and two electric churn-drills. Alterations were made to the primary and secondary crushing plants—seven disc-crushers replacing eight rolls at the latter. Five more discs are to be added. Car haulage of tailing has proved better than belt-conveyors, and the disposal system now handles 1000 tons per hour. The sulphuric-acid plant was always able to meet requirements of the leaching department. At the smelter a second wire-bar furnace was completed. The whole plant is to be enlarged to a capacity of 15,000 tons daily, instead of 27,000 as contemplated. This is for the time being. There was no trouble in securing ample labor. The natives are rapidly adapting themselves to important operations. The number of people living on the property total 9287. The welfare department did much toward the contentment of employees.

Penarroya Mining & Metallurgical Co.

This famous lead-silver producer is one of the leading mines of Spain. The properties are situated in the southern part of the country, the metal mines being near Granada. The company is controlled by French shareholders. The size of the operations is shown by the fact that in 1917 the company marketed 7,715,354 fine ounces of silver, 330,708,400 lb. of refined lead, and 3,740,600 lb. of spelter. This production represents a diminution from the returns for the previous year, ascribed to a decrease in the tenor of the ores from the mines in the district of Linares. The corporation also owns and operates coal mines in Spain that produced last year a total of 756,000 tons. These mines are in the Peñarroya basin, near which is the principal smelter. Owing to the shortage of coal in Spain, however, the company has been obliged to deliver a large part of the output from its collieries to the Government for use on the railways, while it brought coal for its own operations from England. The total production of coal from the mines of Spain was 5,972,000 metric tons (1 metric ton = 1.102311 avoirdupois ton) during the year 1917, and is rapidly increasing under the impetus of favorable legislation. The Peñarroya company, being the owner of a fleet for its own operations, was in a position to secure coal from abroad, especially since part of its shipments of metal were made to England, or delivered to France for the benefit of the Allied cause. The total galena recovered from the ores of the company amounted to 70,072 metric tons, and of zinc blende 2940 metric tons. From outside sources there was delivered to the Peñarroya smelters 3080 metric tons of galena and 3263 metric tons of zinc blende. On account of the shortage of labor and the increase of wages to more than double the rates prevailing before the War, the company is preparing plans for a complete reconstruction of its Peñarroya smelter, following the most-advanced American models. To this end, the manager has recently visited the United States to study our large plants and methods, and to arrange for the delivery of at least a part of the equipment needed by manufacturers in this country. One of the objects is to reduce the amount of hand-labor required, substituting mechanical appliances as far as possible. The company has also put in blast a new smelter at Marseilles, France, treating ores from Spain and from mines belonging to the same concern in Pierrefitte in the Pyrenees. In addition to these enterprises the Peñarroya company has undertaken large mining and metallurgical operations in Algiers and Tunis. For the use of its mines and smelter in southern France, it has under construction a hydro-electric plant in the valley of the Neste d'Aure, to develop 10,000 kw. The net product from all operations in 1917 amounted to $2,799,723, from which there was applied to amortization and reserve the sum of $279,978, leaving a disposable balance of $2,519,808. Out of this was paid a regular dividend of 12½ francs per share on the capitalization of 292,500 shares having a par value of 250 francs each, or roughly $14,625,000. In addition an extra dividend of 27½ francs per share was paid, making a total distribution of 40 francs per share, or $2,350,000, being at the rate of 16%.

Mining Decisions

Suit on Adverse Claim—Evidence

In a suit brought to determine an adverse claim for patent when the issue was one of discovery of mineral and conflict of boundaries, proof of performance of annual labor or the $500 worth of work required as a pre-requisite to patent was immaterial and properly rejected.

Roberts v. Oechsli (Montana), 172 Pacific 1037.

Mine Lease—Responsibility for Machinery

Where the lessee of a mine agreed to operate continuously and "to keep the machinery in as good working order as when he took possession," his lease became subject to forfeiture when he did not re-build, within a reasonable time, the mill which was practically destroyed by an unusual flood, even though he continued to mine free ore after the destruction of the mill and to pay royalties thereon.

Bradley v. Holliman (Arkansas), 202 Southwestern, 469.

Texas School-Lands—Mineral Rights

Under the laws of Texas the owner of mineral rights in school-lands under a State permit must comply with certain requirements specified or have his rights forfeited. Held, that failure to comply with the requirements does not 'ipso facto' work a forfeiture, but the forfeiture takes place only when the Commissioner of the Land Office indorses a termination of the permit upon the duplicate on file in his office. Mandamus will not lie to compel this indorsement.

Underwood v. Robinson (Texas), 204 Southwestern, 314. June 28, 1918.

Conversion of Ore—Shipping and Smelting Charges

In an action for the conversion of ore, in the absence of pleading and proof as to the cost of shipping the ore or the charge for smelting the ore, an innocent purchaser for value from persons who had taken the ore from plaintiff's claim by an unlawful trespass thereon is not entitled to a recovery of the shipping and smelting charges. A location made by persons on ground already covered by a valid existing location upon which annual labor has been performed is void and the attempted re-locators are in the category of trespassers.

Kelvin Lumber & Supply Co. v. Copper State Mining Co. (Texas), 203 Southwestern, 68.

Severance of Minerals—Effect of

Ordinarily, oil and gas while in the earth are not the subject of ownership separate from the soil, but the owner of the land may dismember his ownership and sell his land, excepting and reserving to himself the oil, gas, and mineral rights therein. The right to such severance is not affected by the migratory character of oil and gas, if the oil or gas flow from beneath the land, the value of the reservation is diminished 'pro tanto' but not the right to take such oil or gas as may be found there. The right to take minerals thus reserved becomes a separate entity, and its ownership is attended with all the burdens and incidents peculiar to the ownership of land.

DeMoss v. Sample (Louisiana), 78 Southern, 482.

The American Smelting & Refining Co. reports a net income from all sources for the first half of 1918 of $9,745,526. This is a decrease of $9,012,374 when compared with the same period of 1917.

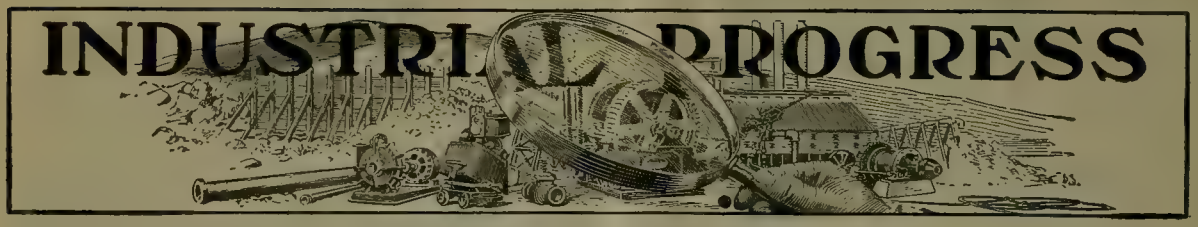
Book Reviews

International Mining Law. By Theo. F. Van Wagenen. Pp. 342, index. McGraw-Hill Book Co., Inc., New York; Hill Publishing Co., Ltd., London, 1918. For sale by 'Mining and Scientific Press'. Price, $3.50.

This readable and attractive volume presents the mining laws of the world mainly in an abstracted form, and also treats the subject from a comparative historical standpoint. It is many years since a work has appeared in English covering this field and this is the first work of its kind to appear in the United States. 'Walmesleys Guide to the Mining Laws of the World' (London 1894) has long been out of print, and Alford's 'Mining Law of the British Empire' (London 1906) is limited in scope, as its title indicates. There is in this country a pathetic ignorance of foreign mining laws and of the principles underlying mining law in general. The recent widespread agitation for a profound revision of our own mining statutes has revealed remarkably little well-considered thought on the subject. Few possess ideas more inclusive than a demand for the repeal of the extra-lateral and discovery provisions of our existing laws, and no satisfactory workable substitute for these ancient and venerable doctrines has been suggested. Before we tinker with laws that have been the outgrowth of the American miners' own conception of what they should be, we should know at least what other countries have done in similar legislation.

The author states in his preface that: "Practically all the raw material in this volume was collected primarily for the purpose of enabling the author to form an intelligent opinion as to whether the American Federal Mining Law was in need of revision, and if so, in what respects." He finds the fundamental principles of the American system of mining law to be sound and, on the whole, to present a workable and democratic system, comparing favorably with those abroad, and, if judged by practical results, to vindicate its existence. He favors ownership of mining claims in fee simple as opposed to the leasing system, and emphasizes the important part the prospector plays in this country, whose activities, he feels, should be still further encouraged. It is regrettable that he did not select a more accurate title for his work. International Mining Law implies one system of mining law common to nations generally. It is extremely doubtful, if the League of Nations should become a reality and the now shattered fragments of international law should be gathered together and placed on a firm and unshakable foundation, whether mining law will receive any consideration whatever as a subject meriting international attention. What the author doubtless intended by the title is rather Mining Laws of Nations, or Mining Laws of the World.

We note a few inaccuracies of statement, such as, "unpatented mining claims are not taxable by the State" (the Supreme Court of the United States has held otherwise); the Federal law only "inferentially requires" discovery, (as to lode-claims the Federal Statute is specific on this point). We cannot always concur in his conclusions, and at times he is inclined to speculate to a degree not warranted by his premises. For example, there is no reliable data to justify his statement that the extra-lateral right probably had its root in the laws of the Roman Empire. We also regret that, in a work possessed of so many excellent features, he does not, with rare exception, cite the authorities upon which he bases his statements. In spite of these minor criticisms the work is well worth while. It occupies a place in the literature of mining law that heretofore has not been represented in America, and deserves attentive study by everyone who is interested as mine owner, operator, or mining attorney. This was referred to editorially last week.



INFORMATION FURNISHED BY MANUFACTURERS

COMMERCIAL PARAGRAPHS

The Giant Mineral Co., Louisville, Kentucky, is planning for the development of a fluorspar property near Marion. J. B. Riley is president.

The Dominion Feldspar Co., Rochester, New York, affiliated with the Rochester Feldspar Co., has broken ground for the erection of a new two-story plant on the Genesee river.

The Gulf Sulphur Co., Bay City, Texas, has increased its capital from $250,000 to $750,000 for proposed extensions. The company has also filed notice of change in name to the Texas Gulf Sulphur Company.

The Solvay Process Co., Syracuse, New York, is preparing for the erection of a new plant for the manufacture of picric acid near Grand Rapids, Michigan, to cost over $1,000,000. The works will be used for Government service.

The Federal Mica Co., New York, New York, has been incorporated with a capital of $25,000 to operate mica and kindred properties. G. L. Ambert, D. S. Dushking, and E. A. Gersbach, New York, are the incorporators.

The Rare Metals Reduction Corporation, Newark, New Jersey, has been incorporated with a capital of $20,000 to operate a metal reduction works. Julius Cuter, 7 Hinsdale place, and Henry M. Snitzer head the company.

The International Graphite Corporation, Richmond, Virginia, recently organized with a capital of $7,500,000, is planning for extensive operations and development work in graphite properties. Thomas B. Gay is president.

The United States Manganese Corporation, 50 East 42nd street, New York, is rushing construction in extensions to the milling plant of its subsidiary, the Butte-Detroit Co., at Ophir. The plant will be used for the handling of manganese ore.

The American Sheet & Tin Plate Co., Frick building, Pittsburgh, Pennsylvania, has completed plans for a tinplate mill to be constructed near Gary, Indiana, at an estimated cost of $10,000,000. Bids for the erection will be asked at once.

B. H. Tripp, special representative of the **Chicago Pneumatic Tool Co.**, on the Pacific Coast, has succeeded M. W. Prieseler as district manager of sales for the Pacific Coast territory. His headquarters are at 627 Howard street, San Francisco. The Los Angeles branch of the company, at 251 Title Insurance building, comes under Mr. Tripp's jurisdiction.

In connection with the installation of a battery of 300 by-product coke ovens, of the Koppers type, at the Eliza furnace of the **Jones & Laughlin Steel Co.**, Pittsburgh, Pennsylvania, arrangements have been completed for the erection of a number of new buildings to cost $390,000. About $750,000 has been expended to date for property in this vicinity.

The Wood Equipment Co. has recently purchased and equipped commodious shops at Grand Crossing, Chicago, in order to provide increased facilities for manufacturing the pneumatic rotary dump and other mining specialties. The main offices will be at that plant, and the company will continue to maintain a city office in the McCormick building, Chicago, as well as branch offices in New York, Pittsburgh, Knoxville, and Denver.

The Chicago Pneumatic Tool Co. announces that a contract has been let and work started on the erection of an up-to-date addition to its Cleveland plant, to double the present output. It is expected that work will be completed on the building about November 1. The necessary equipment has been ordered, and it is believed that it will be delivered and ready for installation by the time the building is completed.

The Birmingham Steel Corporation, Birmingham, Alabama, has commenced construction of its new steel works at North Avondale, near Birmingham. The initial unit will cover an area of approximately 5 acres. The company has filed notice of an increase in its capital from $1,000,000 to $5,000,000, to provide working-capital for the project. The plant will specialize in the production of fabricated steel sections, a large portion of which will be for the Mobile Shipbuilding Co. Henry Leon Brittian is president of both organizations.

The Lunkenheimer Co. of Cincinnati, royally entertained the delegates and visitors to the N. A. S. E. National Convention held in Cincinnati during the week of September 9. The company obtained permission to use Cincinnati's wonderful Zoological Gardens on Wednesday afternoon and evening for their outing. Amusements were arranged by Lunkenheimer representatives. The vaudeville was particularly enjoyed, especially the ice-skating upon the only outdoor artificial ice-skating rink in the United States. The performers were the best that the profession afforded and were brought from Chicago solely for this affair. Dinner and other refreshments were furnished gratis to the delegates and their friends by the Lunkenheimer company. Over 1500 people were entertained.

The Nevada Engineering & Supply Co., of Reno, Nevada, announces an extensive list of machinery and equipment suitable for mines, mills, and shop, ready-to-deliver, and available for shipment at Reno, with a special circular announcing equipment suitable for gold milling or crushing for flotation, now on hand and ready to ship at Wabuska, on the S. P. railroad in Nevada. In these days, when mine equipment is hard to obtain, even when priority orders are issued, the chief reliance of new enterprises necessarily is upon second-hand supplies. The manager today does not scrap old equipment with the glee that used to scorn the opportunity to repair and conserve. Old machinery has become precious, and the services of companies that collect and make available the old appliances are deeply appreciated. The catalogue of a second-hand supply house has come to mean as much, and, if time is a serious item, to mean even more than the announcements of the original manufacturers.

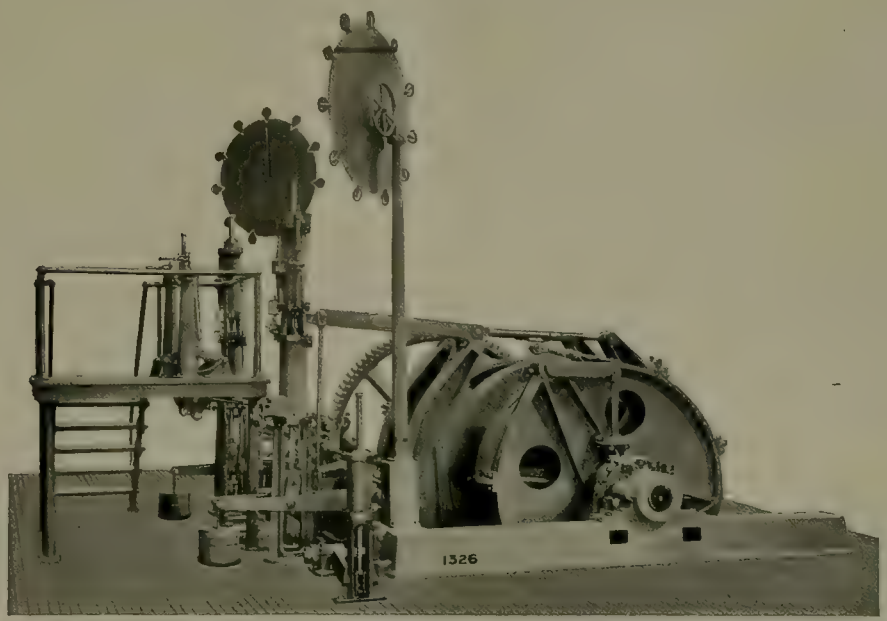
DEWCO ELECTRIC HOISTS

Repeat Orders are Proof of Efficiency

Read what the Socorro Mining & Milling Company of Mogollon, N. M. said when they ordered the DEWCO hoist shown in the cut:

"The new 10,000 lb. hoist which you shipped to us has been assembled and erected, and is nearly ready for operation. We beg to advise you that we are very much pleased in every detail with the hoist construction."

"The rugged design and heavy service afforded by your old 6000 lb. hoist, which has been in service here for eight years, has influenced our decision in continuing our patronage."



MACHINE CUT GEARS INSURE SAFETY, PREVENT NOISE, REDUCE FRICTION.

AIR-COOLED BRAKE RINGS PREVENT OVERHEATING DURING BRAKING OPERATIONS.

INCREASED LEVERAGE IN BRAKE MECHANISM GIVES POWERFUL CONTROL OF LOAD.

NOTES 509

KEEP FAITH WITH THE DEAD 510

England and France each have a million dead on the roll of honor; we have lost few, but with that loss the iron has entered the soul of America; the only redemption for the lost ones is to establish the world on the basis of a firm peace; shall it be 'in vain,' or 'never again'? M. & S. P., October 19, 1918.

KAMERAD? 511

What is the German government? Are we to sheathe the sword with the Germans merely frustrated and not beaten? Is the chief aggressor to escape punishment as did Bulgaria? Are the uncertain phrases of public speeches to be used as the basis of negotiation to avoid the wrath of the world? M. & S. P., October 19, 1918.

THE GOVERNMENT'S DUTY TO THE MINER 511

The War Minerals Bill a dead issue; there is no measure now to protect the poor miner; the Government, through its accredited agents, however, is committed to a moral obligation to avert losses by those who patriotically responded to the call to produce chrome, manganese, and other metals. M. & S. P., October 19, 1918.

DISCUSSION

THE CHROMITE CRISIS

By Hugh W. Sanford and F. C. Smith 513

Strictures upon criticisms of the unjust policy toward chrome producers pursued by the War Industries Board; hint that a remunerative market may possibly be arranged for first half of 1919.—— Fiascoes in the Committee-management of war-industries; politicians muddle the war-business through favoritism; new and honest appointees needed. M. & S. P., October 19, 1918.

INTERNATIONAL MINING LAW

By F. W. Carnahan 514

Suggestion for a reciprocity agreement with countries admitting alien privilege of locating claims. M. & S. P., October 19, 1918.

GOLD PRODUCTION

By Akin M. Nicholas 514

Proposal to require marketing of all gold to the Government and fixing differential prices for metal sold to the trade. M. & S. P., October 19, 1918.

LOSS OF QUICKSILVER

By H. G. Smith 514

Comparison of losses in Huntington-mill practice with losses in stamp-mills as shown by W. J. Sharwood. M. & S. P., October 19, 1918.

ARTICLES

Page

THE UTAH COPPER ENTERPRISE—III. THE MINE

By T. A. Rickard 515

Trip from Salt Lake City to the mine; geology of the deposit; the ore is mainly a monzonite porphyry, feebly mineralized with copper sulphides, with subsequent enrichment by downward leaching; mineralogic changes, and relation to enclosing rocks; the workings; map of the area; method of bank-blasting, and handling the ore; local manufacture of explosives; the quartzite over-burden; water and air-service to the working-terraces; contrast with steam-shovel operations on the Yukon. M. & S. P., October 19, 1918.

POTASH FROM CEMENT 525

M. & S. P., October 19, 1918.

INFLATION AND BUSINESS AFTER THE WAR 526

The economics of inflation and its relation to post-war business; review by staff of the National City Bank; monetary systems of the world; credit now artificially elastic; stringency to follow unless 'waiting orders' maintain the demand, creating an active market; gold as the basis of credit. M. & S. P., October 19, 1918.

COMPLETED FIGURES FOR GOLD AND SILVER OUTPUT, 1917 528

M. & S. P., October 19, 1918.

RECENT DEVELOPMENTS IN MOLYBDENUM

By L. F. S. Holland 529

Reliable sources of molybdenum; outlook for wulfenite; large bodies of low-grade molybdenite developed by Climax Molybdenum Co.; description of the ore and methods of concentration; property of Molybdenum Products Co. M. & S. P., October 19, 1918.

A LETTER FROM THE FRONT 532

M. & S. P., October 19, 1918.

THE TERRY DIFFERENTIAL PROCESS

By Joseph T. Terry, Jr 533

Method based on the action of ammonia in promoting oxidation of metallic sulphides by entrained air; iron oxide insoluble in ammonia, but oxides of zinc, lead, and copper soluble in that reagent leaving those sulphides clean. M. & . S. P., October 19, 1918.

LATEST MODEL
NO. 9 WILFLEY

Double capacity in same floor space

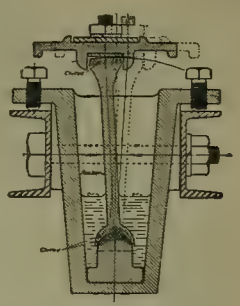
WILFLEY TABLE

Since it was first offered for sale less than three years ago THE NO. 9 WILFLEY HAS BEEN A VERY POPULAR TYPE OF THE FAMOUS WILFLEY TABLE. By the use of the No. 9 WILFLEY TABLE it has been possible to double the table concentrating capacity without increasing floor space and without loss in metallurgical efficiency.

This machine has, heretofore, required slightly increased horsepower to operate as compared to the No. 6 WILFLEY but now even this objection HAS BEEN OVERCOME by our new Wilfley Rocker Bearing which cuts down friction, reduces power consumption 50%, and eliminates undue strain on the head motion.

The No. 9 Wilfley is equipped with extra heavy head motion, self-oiling bearings throughout, cast steel yoke and pitman, adjusting block, and improved feed and water boxes, besides embodying all of the excellent features of the well-known No. 6 Steel Frame Wilfley Table. Ample light and room between decks.

No. 9 WILFLEY TABLES have been tried and proven by the big users such as Nevada Consolidated Copper Co., U. S. Mining Co., American Zinc Co. of Tenn. and many others.



WILFLEY ROCKER BEARING
Ease of operation—reduces friction—50% less H.P.

Find out why so many big concerns are using Wilfley Tables —and ordering them for their new equipment.
Remember Massco Service is behind every Wilfley Table.

The head motion is extra heavy. Has chain oiling bearings—splash oiling pitman—3 point yoke suspension—cast-steel parts—a first-class motor for shaking launders.

BUY A THRIFT STAMP EVERY DAY of YOUR LIFE

THE President, in his note of October 14, informs Germany what it means to accept our terms of peace. Concurrently he states that 250,000 soldiers are to be sent monthly to the front. No armistice is granted. So far, so good.

GERMAN brutality does not diminish on the eve of their military collapse. The scenes enacted when the 'Ticonderoga' was sunk by a submarine were the most horrible since that fateful day when the 'Lusitania' was assassinated by the same set of pirates. After the 'Ticonderoga' was fatally disabled the Germans shelled the passengers trying to escape in the boats, and again while the vessel was disappearing under the waves they shelled the one lifeboat that had been launched successfully. Are these the people that are to escape punishment by shrieking 'Kamerad' as soon as they see themselves beaten; or ask for an armistice in order to reorganize their shattered armies?

AS a measure of the marvelous growth of the chemical industry in the United States, Mr. Charles H. Herty, in his report as chairman of the Advisory Committee to the Chemical Exposition held in New York last month, presented a comparative statement of the exportation of four commodities for the fiscal years ending June 30, 1914 and 1918, respectively. The figures are impressive. Sulphuric acid increased from 6000 to 34,000 tons, caustic soda and soda ash from nearly nothing to 334,000,000 pounds, benzol from nothing to 25,000,000 pounds, and dyes from a value of $357,000 to $17,000,000. The Government has expended $198,704,000 in the production of materials for gas-warfare. The preparation of potash salts has grown from 1000 tons in 1915 to 32,000 tons in 1917. The trade-mark of the future will be 'made in America'.

EXCESSIVE optimism is playing into the hands of the Enemy. Wild talk about the War being over before Christmas is bound to slacken the efforts being made to bring the War to the only conclusion that will retrieve the calamities it has brought on civilization. Pro-German propagandists are busy in our midst for the purpose of relaxing the force of the Allied attack. For example, here in San Francisco there have been spread rumors that the banks had been ordered to prepare for peace and that an order had been issued from Washington to stop ship-building. These are lies circulated by friends of the Enemy. All good citizens should not only refuse to give credence to such stuff but they should denounce them promptly. When the War will end no man knows, but we do know that if we are to end war we must see this one through to a definite conclusion, and that means the complete and irretrievable defeat of the aggressor.

IT is announced that the Dominion government has approved an investigation into the rates levied by the Consolidated Mining & Smelting Company of Canada for the treatment of ores at its Trail smelter, in British Columbia. The committee of investigation consists of Messrs. S. S. Fowler, Ivan D. Lachmutt, and James Anderson. We feel assured that under Mr. Fowler's leadership this committee will act fairly, so that if anything is wrong it will be disclosed, and if the conduct of the smelter people is correct they will be fully exonerated and suspicion allayed. We trust that the investigation will be more convincing than the one made in Colorado by the committee appointed by the State legislature last year.

HOW insincere are the protestations of our discomfited Enemy is made clear by his continued efforts to destroy and devastate the invaded countries from which he is being compelled to retreat. The destruction of the great coal-mining region in northern France, roundabout Lens, Douai, and Cambrai, is horrible. The Germans are taking pains to commit as much wanton sabotage as time will permit; they are destroying the mines, the cities, and more particularly the public buildings, looting as they go backward. In Belgium they are collecting all the cattle and foodstuffs belonging to the emaciated population and compelling the young and old alike to do their dirty work. What is the use of listening to 'defensive' talk and 'protection of the fatherland' so long as they continue their merciless marauding and bestialities. It is time for the Allies to notify the German government, that is, the Kaiser and his nominees, that the officers giving orders to perform these acts of vandalism will be held to personal account and brought to proper punishment when the hour of accounting arrives. The theory of personal responsibility is one that should be enforced as against the Kultural notion that a man is justified in surrendering his conscience to his superiors. The British

government did well, when the naval attaché at Petrograd was killed, in notifying the leaders of the Soviets that they would be held personally accountable for this murder and for others they might commit. Civilization revolts at the Prussian idea that any atrocity is permissible in time of war, especially on the losing side. Among nations, as in a community, we must assert the principles humanity has toiled to establish since emergence from the jungle.

TO demand indemnity from Germany is to pardon her crimes and to let her go with a fine. A Germany left so consolidated, so integral as an empire or as a representative government, that it can finance a payment of indemnities comparable to the magnitude of the depredations and damage done, is still a great, powerful, and dangerous Germany; it is still a potent force for evil and disruption, merely stung by defeat, not crushed and humbled; it is still a nation full of the consciousness of power, of which the indemnities constitute a measure; it is merely a nation with its ideals of world-power baffled, not blasted. Its pride would be hurt, its desire for revenge would color every one of its future acts. The gold paid over, under duress as indemnity, would become its boast of greatness, its demonstration to on-coming generations of ability in the future to wipe out the defeat of 1918 by forcing the world to accept the Pan-German yoke. When Bismarck defeated France in 1871 he imposed upon her an indemnity so great that all men thought it involved the collapse and downfall of that nation, but it proved only a stimulus to industry and thrift. France paid it, and laughed as Hercules laughed at the penalty imposed for his affair with Linus; his exile merely offered the opportunity to begin the twelve labors that covered his name with mythic glory. The nation that Bismarck believed he had crushed with a mountainous financial burden met the helmeted barbarians of 1914 at the Marne with a shock that shattered their dreams of conquest, and saved the world from destruction. We must beware how we measure in terms of money the things that are above or beneath barter and sale. A fine imposed is not an indignity; it is only putting a price on the thing that is called in question. We must not forget that the Germany of Bismarck used the plausible excuse of a plotting emperor as its *casus belli*, but it assessed its damages upon the French after their emperor had become a prisoner at Wilhelmshöhe, while they themselves were in the throes of re-organization as a republic. Not thus are nations humiliated. Even in finance the great names derive more honor and power from the magnitude of their liabilities, while they are in full career, than could come from the inactive balance after liquidation. Let us not commit the error of negotiating with a brigand people that is simply halted in its campaign of loot. France could boast of her innocence and her recuperative power, and she stood for civilization; an uncrushed Germany would boast of its power, in paying for trespass, with that age-old jeer of the savage Goth, unashamed, and unconscious of sin. On to Berlin!

Keep Faith With the Dead

All thoughtful men, particularly those whose kinsmen have made the supreme sacrifice, have realized increasingly as the War has progressed that the loss of life was a calamity that would become an unspeakable tragedy if it were made in vain. England and France have each a million dead on the roll of honor; we have lost comparatively only a few as yet, but they are dear to us and they seem many already. The iron has entered the soul of America. We are now in a position to sympathize with steadfast England and gallant France whose heart's blood has been poured continuously during four long years in the heroic effort to hold the enemy and to drive him back across the frontiers of freedom. Daily the casualty lists grow; we realize more and more the seriousness of the part the United States is playing. Out of suffering this nation is being made strong in spirit as in material resourcefulness; by sacrifice this composite people is being welded into a unit in preparation for its destiny as a liberalizing force in civilization. All this depends, however, on the fulfilment of one condition: that we hold firmly to our aim, which is to end war by making the aggressor in this war so sorry that he started on his campaign of aggrandizement that he will be forever unwilling to repeat the attempt and that others will be forever deterred from imitating him. There must be no more imitators of Alexander, Charlemagne, Napoleon, or Wilhelm II of Hohenzollern. That in itself is reason enough for seeing this thing through to the very end, namely, the complete defeat of the Enemy and his disarmament; but there is a more binding obligation upon us than even the restoration of international law, big as that is; we are deeply bound in honor to keep faith with those that have died for us in battle. They gave us their inspiration and their trust, their services and their lives; if we fail to complete the task to which they dedicated themselves then our roll of honor becomes a record of failure, a memorial of bad faith, a reminder of the pitiable wasting of the flower of the race. The one thing that can redeem the horror of the last four years is the assurance that the world will never again be subjected to such a holocaust. If that assurance be wanting, by our coming to terms with the aggressor, then all the suffering and loss will have been in vain. For what did those millions die? For what were Belgian babies killed and French women dishonored; for what were strong men driven into captivity and returned the pitiable husks of life; for what did the wounded British soldiers suffer tortures from devils incarnate and our American boys drain the cup of sacrifice? Do we owe nothing to them, shall we so soon forget our debt to the dead? The gallant men that stormed the gates of hell were glad to die because they believed that their lives were not wasted; they were proud to die because they felt confident that their task was done and that their cause would triumph. Have we the courage to face the hosts of the dead and tell them that they died for naught? Shall it be "in vain" or "never again"?

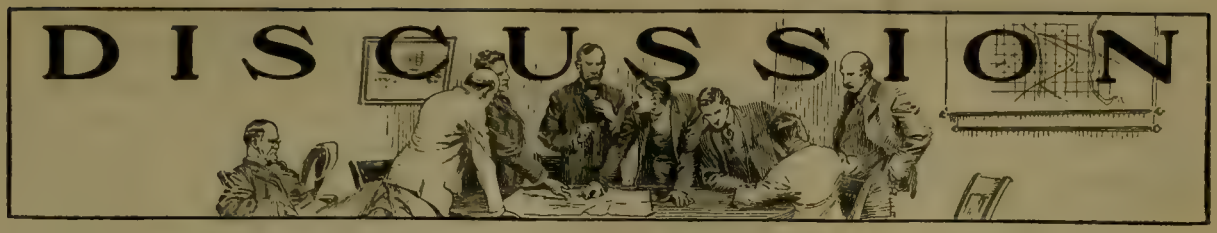
Kamerad?

The German government—whatever that may be—has accepted the conditions of peace laid down by the President of the United States on January 8, 1918. The news was flashed around the world on October 12 and immediately called forth the most eager questioning of its real meaning. At that very moment the newspapers that brought the news were full of accounts of German sabotage and brutality in the regions over which their defeated armies were retreating; they also quoted Sir Eric Geddes, who, speaking for the British Admiralty, informed the American public that a great renewed submarine campaign on the part of the Enemy was impending. Many doubts arise, and the chief of which are these: Has the government of Germany passed out of the hands of those responsible not only for the War but for the bestial manner in which it has been waged? Are the Kaiser and his henchmen still the real power behind the present Chancellor and the Foreign Secretary? Is it Jacob or Esau that is speaking? What proof is there that we are talking peace with the representatives of a repentant German people? Having brought untold horror and calamity upon the world, and having failed in their insane ambition, is the German people so sorry as to be determined never again to support a similar criminal enterprise? Are we going to sheathe the sword and come to terms with the bloody aggressor merely because he sees that his dream of world dominion has been frustrated? Is Germany penitent or only foiled; is she merely willing to hood her claws until a more convenient opportunity arises? These claws must be cut, they must be removed to the roots, lest the beast re-assert herself at the next chance. We have a hundred reasons for doubting the sincerity of Germany; every move made by her is suspect; the whole proceedings savor too much of the 'kamerad' performance in battle, when a Hun, having killed as many of our men as he can, raises his hands in surrender in order to escape his logical fate. So did Bulgaria: having massacred the Serbians, Montenegrins, and Rumanians; having devastated and despoiled the lands of her neighbors under the protection of the German armies, she capitulated at the very moment when her own country was about to be invaded and she was to undergo the logical punishment for her actions. Bulgaria escaped justice; is the bigger criminal to be allowed a similar immunity? Having broken every international law, having become an outlaw, is Germany to be treated as an honorable antagonist? These are some of the questions that must have exercised the minds of thoughtful men last Sunday, when this was written. The President's famous Fourteen Terms are familiar now to everybody. When he enunciated them he probably had no expectation that they would be accepted so soon at their face value. The German government—whatever that may be—appears to have accepted them in fear that the conditions to be imposed by the other Allies might prove even more exacting. Much remains to be defined. The terms numbered VII and VIII, for example, require specific interpretation. "Belgium must be evacuated and restored." What does "restored" mean? Does it mean, as it should, the reconstruction and rehabilitation of the bridges, railroads, cities, and public buildings of that innocent victim of Prussian frightfulness? Does it mean the return of, or compensation for, the money, supplies, and material removed from Belgium to Germany? For the dead manhood and outraged womanhood of Belgium the Kaiser and his people can make no recompense; for these they will account to history and to the God whom they have blasphemed continuously. Is the burglar to be compelled to give back the stolen goods, after having murdered the women and children in the house? Again, "All French territory," says the President "should be freed and the invaded portions restored, and the wrong done to France by Prussia in 1871 in the matter of Alsace-Lorraine should be righted." What do "restored" and "righted" mean? Is indemnity to be given for the incalculable sabotage perpetrated by the brutal armies of the Hun? Will they replace the machinery they took from the great industrial centres of France, the statues they melted for making munitions of war; will they re-build the cathedrals they shelled wantonly and systematically? More important still, will they give to France an amount of iron ore equal to that extracted by them from the mines of the Longwy-Briey basin? Does the "righting" of the wrong done to France mean specifically the unqualified restoration of Alsace and Lorraine to that country, with compensation for the millions of tons of iron ore that Germany has taken out of Lorraine for the purpose, *inter alia*, of making guns, rails, and equipment wherewith to attempt the complete subjugation of France? The President has enunciated conditions of peace such as might be addressed to a repentant Germany, to one that had decided to throw the Hohenzollern dynasty on the scrap-pile of belated anachronisms, to one that saw the error of its ways and was anxious to rejoin the comity of civilization; is he talking to a penitent or only to a burglar merely eager to escape punishment? We abide the issue, confident that in this supreme hour he will act so wisely that what he does will win the support of this country, the approval of the Allies, and the commendation of posterity.

The Government's Duty to the Miner

The War Minerals Bill, as useful legislation, may be dismissed from the mind of every miner who had thought to help his country by responding to the call for chrome, for manganese, for pyrite, to name but a few. We believe that the bill purporting to care for these industries has been agreed upon by the conferees of the two houses of Congress, and been approved. As the President is not a miner, we may exonerate him; he cannot know everything, therefore we can understand that he does not know how the signing of this piece of class-legislation dashes the hopes of thousands of poor men who thought that they had a right to make a dollar by patriotic service as well as did the presidents of sundry corporations now disporting themselves under a dollar halo. We realize

that a plausible technical defence of the bill can be made; the difference between the letter and the spirit of the laws has been long acknowledged; this bill offers one more example of that notable difference. Since we must lay aside all hopes of a straightforward democratic measure, honestly validating the appeal made by the accredited bureaus of the Government when they begged miners to produce chrome, manganese, pyrite, and other war-minerals, the question of national duty should be considered. Even if it be conceded that the Government at present is in such a position that it would be inexpedient to bid the prospectors to continue the search for these minerals under a guarantee to accept, at a fixed price, all the ore they might dig and ship, that has nothing to do with the moral responsibility already incurred. When the bureaus and committees at Washington, some months ago, undertook to stimulate production they set no limit; they made it a mark of patriotism for the miners to respond by delving in the earth and flinging the ores to accredited users for Government account. In line with these urgent appeals the original War Minerals Bill was drawn, meeting exactly such obligations as had been assumed through these blanket orders. Naturally people thought that the officials meant what they said. The War must be won; these minerals were essential to winning it; ships were not available for bringing such material from foreign countries; therefore a man was justified in spending his time, in consuming his nest-egg, or in availing himself of his local credit, to produce these supplies for Uncle Sam. Time was of the essence of the contract, for the War was upon us, and armies that wait are lost. What would you call those pleading letters and telegrams from the War Industries Board and the Bureau of Mines, if they were not in the nature of contracts? As constituted officials of our Government they spoke for that Government, and they told the miners in plain English to make haste and produce! In business that would be esteemed a 'firm order,' if it came from a reputable house. If Mr. E. G. Grace of the Bethlehem Steel Company should wire you to mine and ship him all the manganese you could produce, at a fixed rate, would you feel it necessary to await confirmation by an instrument duly signed and sealed by the executive committee? How long would it take the Board of Governors of the New York Stock Exchange to declare forfeit the seat of a member that had signaled, above the din and confusion of the pit, his acceptance of a quotation for a block of stock and then had repudiated his bargain? The people of the United States are just; they believe in the sanctity of contract, and they do not hold it clever in their representatives to pretend to save a dollar for the Teasury by making the Government play false to its engagements. We are having a startling illustration of the serpentine beauties of bureaucracy! The method of building an organization for war-supplies from an unpaid personnel of men who represent primarily the interested industries is wrong in principle. It has provided a camouflage of patriotism for the profiteers. A man should be paid for the service he renders, and be held accountable to the people for rendering it. Our view of the case is sustained by men of all shades of political faith. This is how it appears to one prominent committee-man in Washington: "First, as to the War Minerals Bill, I agree with you that it has been emasculated until it is of small value. The truth is that it has been killed by the bigger corporations of the country or by the men who run them. . . . The way this Bill has been antagonized by men whom we respect for what they have done in other things, who yet seem to be incapable of divesting themselves of their previous selfish competitive instincts, is grievously disappointing. You know these men, as well as I. . . . It is lamentable how the selfish obstruction, first raised at a meeting of a division of the American Mining Congress, subsequently kept alive by one of their men who camped in Washington and attended practically every hearing of the committees on the subject, acting as lobbyist, and cross-examining witnesses, followed by the attacks of the now president of the Anaconda company . . . have caused delay and amendments." We leave it to others to fight the battles of the wronged food-producers; they have their organs, and their difficulties meet with our sympathy because they resemble those of the metal-miners whose rights it is our special province to defend, especially prospectors. These build the foundations of the mineral industry, because their work constitutes its beginnings. This time it is the small miner who has been unjustly treated. Unscrupulous men have abused the authority given them, and the result is that financial ruin threatens an army of hard-working prospectors and miners. This must not be. The Administration is eager to keep its record clean as the champion of democracy, and it dare not allow such injustice, undertaken for the gratification of corporate greed, to stand unrighted. Every man who has tried to find and produce chrome, manganese, or other war-minerals, and has suffered by reason of the failure of the authorities at Washington to sustain his efforts, should submit a brief statement of the facts; our own discussion columns are open to all, and can serve no better purpose than to present information of this character, subject to verification, for the sake of letting the Government and the people know the manner and extent of the injury done. Given an Act that will admit of making contracts for the minerals needed, the administration of that Act can be so directed by a ruling of the War Industries Board, or by special legislation, which the Administration should endorse as an urgent measure, as to ensure that those already involved, by having actually made ready to deliver ore, shall receive consideration through acceptance of their product under terms and prices that will enable them at least to come out even. We cannot believe that the representatives of our Government, at a critical moment in a war for democracy, will allow deserving men among the plain people to be financially crushed in this manner. The Government will not fail to note that a small group stands ready to win enormous profits on an accumulated stock of ore if this widely distributed competition, which arose in answer to the call of patriotism, shall be demolished. Whether the War continue or not, justice must be done.



The Chromite Crisis

The Editor:

Sir—The writer's attention has been called to an extract from your magazine of September 28, in regard to the chromite situation.

The writer hardly sees how your magazine feels justified in making the comments that are quoted from this article without knowing any more about the facts, or investigating the facts further than you apparently have done. In this article you state you will defer further comment, but we think it would have been a good deal better taste if you had deferred the comment that you did express until you knew the real chromite situation.

The writer himself, does not usually comment on magazine articles, but the reference to "greed of those in the ferro-alloy industry" as causing the present chromite situation is so uncalled for, and so unjustified, that in the writer's opinion it seemed proper to make this statement in a letter to you.

It might be also stated that you have not correctly quoted the advertised policy of the War Industries Board in regard to chromite. The announcement reads as follows: It is the present intention of the War Industries Board to arrange for continued chromite production in the United States for the first half of 1919 at a rate proportionate to the rate of 1918 production, and the trade will be asked to purchase chromite of suitable grade produced in the United States, during the first half of next year at this rate. We believe the tonnage of domestic chromite produced the balance of this year of suitable grade can be sold at the average price paid this summer by the California Chrome Co. If unable to find ready market for ore, wire this office giving tonnages ready for immediate delivery and guaranteed analysis and prices wanted, and to whom already offered and refused.

HUGH W. SANFORD, Chief,
Chemicals Division, Ferro Alloys Section.
War Industries Board, Washington, October 3.

[Mr. Sanford credits us with less knowledge of "the chromite situation" than we happen to possess; most of it, unfortunately, we are not permitted to use, otherwise we would publish it, at once, without hesitation, in the public interest. Our reference to the greed of those controlling the ferro-alloy industry was made deliberately, and, we believe, is fully justified by the facts. We do not care to dispute over questions of taste with Mr. Sanford, but we are glad to publish his statement concerning the present intention of the War Industries Board.—EDITOR.]

The Editor:

Sir—Referring to the article in your issue of October 5, page 437, covering (or touching upon) the inefficiencies of the War Industries Board, the Government Labor Bureau, and the so-called Power Administrator, I suggest that pure patriotism and proper consideration for the public welfare really demand full and continued publication of the various acts of the officials handling these and other commissions from the Government. It is no time to doubt, in the very mildest manner, the good intent of the Government in controlling such industries and public utilities as it may see fit; as true Americans we should all back the Government's action to the limit, even at serious personal loss; but, it is certainly no part of patriotism to overlook or gloss over the malfeasance of the officials, appointed so generally on political grounds, representing the Government in these matters.

When the Government decides to control certain industries, the decision is doubtless the result of long and arduous study and consideration; but, at this point its responsibility is by no means ended, it is only begun, for the entire value of such Government control is dependent upon the efficiency and honesty of the commission appointed to carry out the Government's intent. Our aeroplane fiasco is something we all wish to forget, as a supremely important issue dishonestly handled; and we cannot overlook the fact that practically all of the war issues, such as affect our labor conditions, our food, etc., have affected the millions left at home in a vastly different way from that which the Government most certainly intended. It is probably true (and only natural) that Washington's principal, or only, knowledge of the inhabitants of the various States is covered by the political importance of such people, and that those who lack appreciation of political prominence are unknown and esteemed of little worth. This fatal error naturally places Government commissions in the hands of important State politicians, who, in turn, pass out the subordinate offices to county and municipal politicians; a process which, very naturally, prostitutes justice to personal greed. Emerson once likened politics to "one of the poisonous handicrafts, deleterious alike to the worker and the populace"! How much did he err?

It is an unfortunate fact that most of our newspapers and journals are politically subsidized, and afford no open channel for exact publicity. We are on the eve of a huge expenditure to assist the production of a group of less-known metals. What advantage may we expect from this if the handling of these fifty millions is not carefully scrutinized, and if the clearest light of pub-

licity is not turned on by some honest journals? Just what care has been exercised by the Bureau of Mines to see that the local work in mining centres has been placed outside the shadow of the political upas-tree, and in the hands of men sufficiently honest and capable to make this expenditure something other than a fiasco? Why cannot the Mining and Scientific Press extend its definite knowledge of the matters calling forth this article, and turn on the searchlight?

F. C. Smith.

Chloride, Arizona, October 6.

[We are glad to publish this letter, but we desire to state that "the local work in mining centres" in behalf of the U. S. Bureau of Mines is, as far as we know, in excellent hands; certainly, it is in efficient and trustworthy hands in California and Oregon.—Editor.]

International Mining Law

The Editor:

Sir—Apropos of Mr. Van Wagenen's work on this subject, I desire to express the hope that our law may be modified so as to permit the location of claims in the United States by citizens of such nations as accord similar rights to us without the necessity of changing citizenship or allegiance. Should this suggestion be adopted, it would be well to annex the condition that the annual assessment be inspected and recorded by a Federal official. It would not be amiss if this were done now, since it would discourage the holding of an excessive number of claims for speculative purposes. The recognition, in this manner, of the liberal and friendly mining policy of our Latin-American neighbors and of other nations, can but promote a better mutual understanding.

F. W. Carnahan.

San Francisco, October 8.

Gold Production

The Editor:

Sir—The much debated question of how to stimulate the production of gold is a matter that has occupied my attention for a long time back, and I have read with interest the article published in your issue of July 20 and also the suggestions of numerous correspondents in subsequent issues. It seems to me one way in which domestic production could be stimulated has so far been overlooked.

At present this nation and others fix the value of gold for purposes of coinage but that does not determine its intrinsic value in the industrial arts. Could not the Federal government go further and commandeer all the gold produced at its present price and constitute the U. S. Mint the sole vendor of gold for jewelry, dentistry, and the arts generally? They could impose a 50% charge over and above cost on gold re-sold. To do this would require stringent laws to ensure all gold passing through the Mint. The effect would be that present manufacturers and users would pass the extra cost to their customers. It also would be necessary to have a heavy penalty for defacement of coinage. With the high rates of wages ruling I am of opinion the amount used for jewelry and dentistry would remain much the same as at present. The surplus derived in this way could be devoted to giving a bonus to all producers exceeding, say, 10 oz. standard gold per quarter. The object of fixing 10 oz. would be to lessen the cost of book-keeping. I should not be surprised to learn that gold used for purposes apart from coinage at present would account for 40% of the total production in the United States.

There should be no insuperable difficulty in obtaining an approximation of the gold consumed apart from coinage, and the extra money to be derived in the above manner should be of sufficient importance to give a great impetus to the industry.

Akin M. Nicholas.

New York, September 26.

Loss of Quicksilver

The Editor:

Sir—In the issue of April 6, 1918, I note that in the article entitled 'Loss of Quicksilver in Gold Mills,' by W. J. Sharwood, no data are given on the loss in Huntington mills; possibly the following figures from the operation of the plant of the La Luz & Los Angeles Mining Co., of Nicaragua, Central America, may be of interest.

The mill consists of six 3½-ft. Huntington mills; the ore is a soft altered shale, a considerable portion, locally known as 'manto,' being no more than a stiff clay; the screens used were 20-mesh on the average, the final product being about half a true slime and the other half sand, the gold fairly coarse and clean. Inside amalgamation was practised and each mill discharged upon a 4 by 16-ft. amalgamating-plate, set at an inclination of two inches per foot, the plate-area being between three and four square feet per ton milled per day. The yearly averages of amalgam recovery and quicksilver consumption were as follows:

	Amalgam recovery				Consumption of quicksilver fed based on oz. Troy per ton milled.
	Inside mills	Plates	Creek-bed sluicing	Two Pierce amalgamators	Quicksilver
Years	%	%	%	%	%
1911	60.69	37.17	2.13	...	0.214
1912	63.62	36.00	...	0.38	0.161
1913	62.07	37.31	...	0.61	0.145
1914	62.07	37.35	0.10	0.56	0.127
1915	64.63	35.09	0.27	...	0.167
1916	67.37	31.99	...	0.69	0.102
1917	59.60	39.55	...	0.70	0.142
Average	62.885	36.405	0.26	0.42	0.144

The recovery by amalgamation was from 60 to 75%, depending on the grade of the ore. The concentration of the amalgam was from 36 to 49%, being 43.74 as an average. The average bullion consisted of 840 parts gold and 150 parts silver. The bullion recovery was slightly more than twice the quicksilver consumption, which varied with the grade of the ore.

H. G. Smith.

La Luz, Nicaragua, May 8.

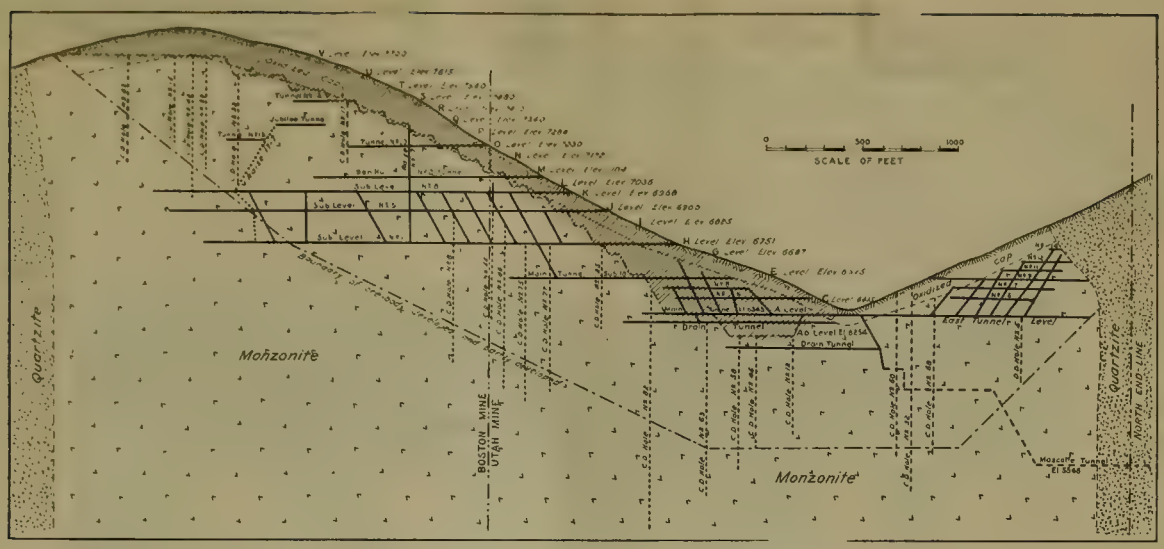


FIG. 1. CROSS-SECTION OF THE UTAH COPPER MINE

The Utah Copper Enterprise—III

The Mine

By T. A. RICKARD

INTRODUCTION. It was 5:25 a.m. as I lay awake expecting the call that was to arouse me from sleep. The air was vibrant with the singing of birds in the Temple gardens. That sounds poetic and Oriental, but, I hasten to say, the temple was Mormon and the singing of birds was the twittering of sparrows, holding their morning concert before the roar of city traffic drowned their effort to express the joy of life. The quiet of an unawakened community brooded over Salt Lake City. I started to dress, feeling superior, for at Ogden, only 38 miles westward, the hour was 4:30 and if the Daylight Saving law had not played fast and loose with Greenwich time it would have been 3:30. I felt like an early bird and had none of the qualms proper to the matutinal worm.

In due course, after breakfast at the Union Pacific station, I caught the 6:55 train for Bingham, which is at the far end, 34 miles distant, of the Bingham & Garfield railway. The sun was beginning to assert himself over the rim of the Wasatch range as the train started. Every seat was taken, for the train carried 700 men from Salt Lake City to their work at the mills on the other side of the valley. They looked like a pleasant lot of fellows, such, as, for example, one would not be afraid to be shipwrecked with. Most of them were reading their morning papers, of which Salt Lake has several, and of a good kind. The Hearst infliction has not been visited upon the Latter Day Saints, as yet. Looking around, I estimated that only 10% of the men were foreigners. They pay $10 per month for their commutation, which takes them daily to and from the Arthur and Magna plants of the Utah Copper company, at the foot of the Oquirrh range, which, with the Wasatch mountains, encloses this southeastern edge of the Dead Sea of America. The valley itself is cultivated with the thrift characteristic of the Mormon people, but much of it is marshy with salt water and defies reclamation. Soon I noticed an embankment like a railroad-grade on the left of the train and wondered what it was until I detected pools of green water at the foot of it. The effluent water was stained with copper; it was the tailing-dam restraining the discard from the big metallurgical works. This dam cut off the view southward, but the smoke now veiling the snow of the Oquirrh mountains suggested intensive industry. Soon the train enfiladed the series of buildings enclosing the Arthur mill, and more than half the passengers alighted. Within five minutes the Magna plant was reached, the train was reduced in length, and the remaining cars proceeded half-empty to Bingham. The railroad follows the eastern face of the Oquirrh range; the sun shimmered across the vast stretch of tailing, estimated at 65,000,000 tons averaging 0.5% copper, as dead metallurgically[1] as the salt waste that it blankets. Beyond Magna the country is more gracious; fields of young

[1]The Assessor for the county has made an effort to value this mass of tailing for taxation, even going so far as to place an arbitrary valuation of $50,000,000 upon it.

grain and alfalfa in clean patches of productive verdure fringe the saline plain at the base of the hills that mark the older shore of the shrinking lake. A group of buildings and a chimney belching smoke mark the settlement of Bacchus, a name not without irony in this 'dry' State, but signifying a stimulant more active than the juice of the grape, for at Bacchus is the Hercules Powder company's factory, producing the dynamite used at the big mine to which I am taking you.

The scenery was tame. The rounded hills, from which the snow had but lately gone, were freshly green. A train of 42 cars laden with ore passed noisily. The gradient increased; excavations on the higher slopes indicated the approach to a mining district; the canyon narrowed, on the opposite side I saw another line of railroad;[2] the train plunged through four murky tunnels and then emerged suddenly into the smoky obscurity of Bingham. The town itself was not discernible, the terminus being high on the mountain-side, and when I alighted I followed the other passengers into what looked like an elevator, but proved to be a tram-car running on a steep incline into the town. An inquiry proved that I had blundered, for the company's office was above, on the level of the railroad, so I ascended by the tram and found my way to the warehouse where Mr. J. D. Shilling, the superintendent of the mine, has his headquarters. My letter of introduction having been presented, I was conducted to the upper gate of the railroad-yard. Passing through the warehouse one could see barrels containing copper wire, to be used for the peaceful purpose of electric conduction; also copper rings resembling the bands that are put around shells, suggesting the warlike use of the metal. These rings, I ascertained, were 4-inch ferrules, used as a filling, or 'skim', at the point where the flues join the crown-sheet of the super-heaters of Baldwin locomotives. On the shelves was $30,000 worth of brass fittings for steam-machinery. Thus some of the uses of copper were indicated at the place where it was being mined. From the railway station one could see, through the smoke made by trains and steam-shovels, a mountain deeply scarred—the edge of the great mine—and from it, above the haze, a glorious flag flew assertively. That flag, 20 by 40 ft., cost $156, and was bought with contributions, of 25 cents to $1 apiece, made by the workers on the occasion of the campaign for the Third Liberty Loan. After a short walk along the railroad-track and over a viaduct, I reached the upper gate, where Mr. T. S. Carnahan (Columbia '05) met me and led me to the upper office at the mine itself.

Arriving at the office of the engineering staff, I noticed on a lower door a sign in Greek:

ΕΙΔΟΠΟΙΗΣΙΣ
ΔΕΝ ΧΡΕΙΑΖΟΜΕΘΑ ΕΡΓΑΤΑΣ

Nobody seemed to know what it meant, but upon entering the lower office it was explained that the first word stood for 'Notice' and the script meant that no laborers were wanted. The men employed at the mine are of many races, nations, and creeds. Of the 1800 employees at this mine, 600 are Americans and 1200 are foreigners, who are classified as follows:

Japanese and Koreans	416
Greeks	406
Italians	151
Armenians	72
Albanians	55
Fifteen other nationalities	100

THE MINE of the Utah Copper company is a mountain impregnated with copper ore—a veritable mountain of ore. Such has been the dream of the prospector from time immemorial. Mount Morgan in Queensland, Australia, was a mountain of gold ore, in so far as its summit was excavated bodily and sent to the mill, although now the output comes from a definite lode-channel within the core of the hill—500 ft. high—on which the outcrop was discovered. Mount Lyell and Mount Bischoff in Tasmania are the sites of big mine-workings that follow orebodies rich in copper and tin, respectively; Mount Davidson was enriched by the Comstock lode, and the Rammelsberg by its famous deposit of silver; but none of these was a 'mountain of ore' so truly as this great quarry, the face of which is 1500 ft. in vertical height and 3600 ft. wide at the base.

To realize the bigness of the mine, it is best to ascend half-way up the opposite hill-slope, on the east[3] side of Bingham canyon; there one faces the serried terraces that mark the successive slices now being cut out of the mass of copper-bearing rock. It is an impressive picture of highly organized human industry. The crest has been removed already, but, foreshortened by distance, the mountain still looks like a pyramid, the levels of successive excavation suggesting the step-like cross-section of one of the famous Egyptian tombs. The outer cover of the hill is colored red, by oxidation; the mass itself is gray. It is a huge theatre, in which the actors are 1800 men; but so big is the stage that they are hardly discernible at this distance. Ore-trains, like children's toys seen from afar, run along the levels and black steam-shovels vomit puffs of smoke as they dig energetically into the precipitous face of the artificial cliff. The smoke from the engines and the little black figures here and there give a touch of the infernal to the picture, but the suggestion is contradicted by the blue sky that canopies the scene. On top of the hill, like a redoubt, is a tank to which water is brought by gravity from Middle canyon, four miles west, to be conducted to the different levels for drinking, for the boilers, and for other purposes.

At noon, from this point of vantage, I watched the blasting. Before it begins, those in control of the operation on the various terraces indicate the fact that all is ready by blowing one long and three short calls from the whistle of a steam-shovel engine. When all have given this notification, the main whistle, blown by compressed air, sounds a general alarm, consisting of an irregular number of long and short calls. This is the signal for

[2]The Denver & Rio Grande, which transports 7500 tons of Utah Copper ore daily.

[3]The canyon runs north and south, except between the settlements of Upper and Lower Bingham, where its course is east and west for 1½ miles. See Fig. 2.

STEAM-SHOVEL LOADING ORE INTO RAILROAD-CARS

AN INGERSOLL DRILL AT WORK

GENERAL VIEW, SHOWING THE TOWN OF BINGHAM IN THE FOREGROUND, THE UTAH COPPER MINE IN THE BACKGROUND, AND THE BINGHAM & GARFIELD RAILROAD IN THE CENTRE. THE WHITE DUMP ON THE LEFT IS PART OF THE OXIDIZED ORE OF THE 'CAP'; THE TERRACES EXTENDING AWAY FROM THE MINE WORKINGS ARE DUMPS OF 'STRIPPING', OR WASTE ROCK, IN GALENA GULCH.

the men in the pit to 'spit' their fuses. As soon as the men on the level above see that the fuses in the pit are lighted, they spit theirs, and so in succession up the series of levels or terraces. Meanwhile the main whistle continues to sound the warning at frequent intervals. As the blasting is completed each steam-shovel gives two long whistles, and when all have reported, the main whistle answers with two long calls, thereby notifying all the men on the hill that the blasting is finished.

First a series of shots is heard in the pit, these representing the blasting of big rocks—'block-holing.' Then a less noisy explosion is followed by a rush of broken rock down the face of one of the terraces. The most effective holes make the least noise. The rumble of running ground is heard above the successive explosions. Some of the holes emit smoke like a cannon. Fume and dust enliven the scene. Everything is on a big scale; as much as 25,000 tons of ore has been broken in one blast, of 10 or 12 holes. Soon the uproar shifts to the right shoulder of the mountain and over it to the other side, awakening fresh echoes in the background of hills.

South and eastward the levels are extended for the disposal of the waste that is stripped from above the ore, for most of the oxidized cap has lost so much of its copper by leaching as to be merely an overburden. At the beginning of this year 121 acres had been stripped ready for profitable mining, and 138 acres have been partly stripped. The dumps of waste represent a face of serrated ground almost as big as the mine itself.

It is a big mine in the open air. Winter does not seriously hinder operations; hardly 24 hours is lost per annum, although last winter twice, for half a shift during blizzards, it was impossible to move the ore-trains until the tracks were cleared by the snow-plow. Being open to the sky, the men are visible all the time; this is not without a salutary influence during labor troubles. There is nothing secret about these *al fresco* operations, which are always open to public view.

Geology. The mountain lies between the forks of Bingham canyon, the main ravine lying on the east side and Carr Fork on the west. Geologically the core of the deposit is monzonite, an igneous rock of porphyritic habit, that is, it has a groundmass of granular texture speckled by a characteristic mineral, like raisins in a pudding, in this case the phenocrysts being chiefly feldspar, but also biotite. Monzonite is a rock resembling granite; it is intermediate between syenite and diorite, the proportion of alkali feldspar (orthoclase) to soda-lime feldspar (plagioclase) being less than two-thirds and more than one-third. The monzonite-porphyry at Bingham has intruded from below into the older rocks, notably sandstone, but also limestone, in such a way as to bend or break the bedding-planes, changing the sandstone into quartzite and the limestone into marble. The plastic magma that, on cooling and crystallization, became monzonite exerted such pressure from below as to bend the sedimentary series into folds and other deformations, producing faults and fissures through which mineralizing solutions ascended. These solutions deposited their metallic contents as they approached the surface, where a lowering of temperature and a decrease of pressure favored precipitation. It has been shown by geologic investigation[4] that the deposition of the ore is closely connected with the intrusion of the monzonite into the quartzite, these two rocks constituting the prevailing terrain of the Utah Copper mine. It is likely that the process of enrichment was started by contact metamorphism, by which the copper minerals were deposited near the monzonite-quartzite contact and subsequently were segregated or concentrated at the contact and on both sides of it, chiefly in the monzonite, for a distance sufficient to begin the making of a big orebody. Hydrothermal activity, such as is the usual sequel to an igneous intrusion, caused mineralizing solutions to circulate along the fractures in the monzonite, particularly near its upper periphery, penetrating the mass of the rock so thoroughly as to effect a dissemination of metallic sulphides, namely, chalcopyrite and pyrite, over an area a mile long, as much as half a mile wide, and for a vertical distance of 2500 ft. All the augite and hornblende of the original rock have disappeared, most of the magnetite, and much of the feldspar. These minerals have been replaced, wholly or in part, by quartz, sericite, pyrite, and chalcopyrite. The replacement of magnetite by the metallic sulphides is the most significant fact. Some of the pyrite has been replaced by chalcopyrite.[5]

A later period of fracturing, followed by further hydrothermal activity, led to the formation of small veins of copper ore, together with an intense silicification and an increase of porosity throughout the mass of copper-bearing monzonite. As yet no mass of ore, that is, of rock rich enough in copper to justify mining, had been formed by the alchemy of nature. The copper was too thinly distributed to constitute 'ore' and would have been unworthy the miner's attention if a period of 'secondary enrichment' had not supervened. The intense fracturing of the rock had formed channels for the circulation of water from the surface; the sericitization, that is, the transformation of part of the feldspar into hydrous potash-mica, had increased the porosity of it; and the oxidation of the uppermost portion of the copper-bearing rock, by the seepage of rainfall and snow-water, had decomposed the chalcopyrite into soluble salts, which descended in obedience to gravitation and became precipitated at a lower horizon in such a manner as to augment the richness of the primary deposit. The secondary copper, precipitated by the reaction between the copper-sulphate solution and the primary chalcopyrite, took the form of the minerals covellite (CuS) and chalcocite (Cu_2S), the latter predominating in depth.

In order that an orebody of large vertical extent could

[4]'Economic Geology of the Bingham Mining District,' by J. M. Boutwell. Professional Paper No. 38, U. S. Geological Survey. 1905.

[5]J. J. Beeson. 'The Disseminated Copper Ores of Bingham Canyon, Utah'. Trans. A. I. M. E. Vol. LIV, pp. 356-401. This paper, published in 1916, throws new light on the genesis of the orebody, and I am indebted to it for much of my information.

be produced it was necessary that erosion should be less rapid than oxidation, thereby permitting the descent of freshly leached copper solution into the mass of primary mineral. That is what happened. The 'cap,' as now seen, consists of a few feet of soil and about 115 ft. of monzonite that has been leached, becoming brown, in contrast to the dark-gray color of the porphyritic copper ore, which extends to a maximum depth of 1800 ft. The average thickness of ore 'developed' and 'partly developed' at the end of 1917 was estimated officially at 538 feet.

The chemical reactions and operations by which the copper of the oxidized zone was leached and carried down so as to enrich the rock below is suggested by sundry observations made and recorded[6] by Mr. Beeson. When the cap is removed and the gray ore-bearing rock underneath it is freshly exposed, the gray ore appears wet, owing to the sulphate solutions percolating from the cap. In a short time the face of rock shows a green stain, extending for 20 inches[7] vertically, and in the course of a few days the evaporation of this acid moisture leaves a thin coating of crystalline copper sulphate. Again, Mr. Beeson noticed how a churn-drill, penetrating 45 ft., remained "scoured and clean" so long as it was in the brown cap, but in approaching the contact with the unoxidized rock it became spotted green, and when the drill had penetrated deeper it showed a coating of native copper, which must have been precipitated in the four or five minutes elapsing between the stopping and hoisting of the drill-bit, and must have been derived from the solution formed by the action of the drill-water upon the moist rock. On another occasion a candle lowered into a drill-hole burned brightly in the portion that was in the brown cap, but became extinguished near the bottom, which was in the gray ore. Even the rapidly reciprocal movement of the bailer did not mix the gas and air sufficiently to change the observed condition. No smell of sulphur gas was detected. It seems probable therefore that the oxygen of the air was being used in changing ferrous into ferric sulphate. A third observation indicated the formation of copper carbonates where water charged with carbon di-oxide came in contact with copper sulphate, such carbon di-oxide being produced by the decay of organic matter on the brush-covered mountain during the change of seasons. Every spring the snow-water carries the copper leached from the cap into the narrow subsidiary gulches. In one of these, the Apex Yard gulch, where the descending water percolates through old filling or waste, containing remnants of ore, it can be seen precipitating its red metallic copper upon scrap-iron at the rate of 15 pounds of metal per 1000 gallons of water.

By similar chemical reactions the copper leached in the zone of weathering was carried downward by the ground-water into the porous and fractured monzonite, there to be precipitated on the chalcopyrite, pyrite, and probably bornite, coating and replacing these primary minerals with covellite and chalcocite, the higher sulphides of copper.

The deposit is called a 'porphyry' orebody because the copper has impregnated an igneous rock having the porphyritic or speckled habit; it is also called a 'disseminated' copper deposit because the metal is distributed comparatively uniformly in minute particles throughout the mass; but to the geologist the Utah Copper orebody is an example of concentration rather than scattering; nature has brought together the copper from two sources, adding that which originated from below to that which was derived at a later stage from above. The net result has been to produce a mountainous mass of a billion tons of rock containing 1% copper per ton,[8] out of which the miner will select as much as it is profitable to exploit, such selection being determined by the cheapness with which he can break, transport, and treat the ore, and then refine the resultant metal. The operations of nature, mechanical and chemical, are supplemented by those of man, who is a great mimic, to the end that, among other things, the metal needed for munitions of war, for the conduction of electric energy, and for the transmission of speech may be available to that complicated system of life we call civilization.

The accompanying map shows the position of the Utah Copper mine in relation to the geologic structure of the locality. Most of the orebody coincides with a peninsular exposure of monzonite, but it also includes portions of the quartzite surrounding the monzonite. This rock extends eastward into the ground of the Ohio Copper, southwestward into the Newhaven and Utah Consolidated (Highland Boy), and south-eastward into the Niagara mine of the United States Smelting, Refining & Mining Co.; but it has not proved ore-bearing anywhere outside the Utah Copper property except in the Ohio Copper company's ground, where, however, the ore now being won comes entirely from the quartzite adjoining the monzonite. See Fig. 1.

THE WORKINGS. Let us now visit the mine itself—the theatre-like quarry that I have tried to describe in a general way. Mr. Carnahan was my guide and to him I owe most of my information. At the base of the tiers of levels, averaging 69.5 ft. apart in vertical height, is the 'Sub A' pit, the bottom of which is at an altitude of 6249 ft. above the sea. A green pool of water on the floor of this pit suggests copper, but fails to indicate that an adit, called the Mascotte tunnel, 12,000 ft. long, conducts the drainage under the opposite ridge (on which we stood to get our view of the mine), into the Salt Lake valley on the other side. See Fig. 1. This adit serves as a motor-haulage level from the Ohio Copper mine to the concentrating-mill at Lark. The 'Sub A' pit, which forms the lowest level of the Utah Copper surface workings, is 681 ft. above this adit and drains into it as follows: a 6-inch churn-drill hole, 60 ft. long, connects the bottom of the pit with a drainage-drift, which, in turn,

[6]Op. cit. pp. 299, 390, 394.

[7]Mr. Beeson says 20 ft., but that is probably an error.

[8]This is merely my own generalized statement, of geologic interest; the estimate of ore in the mine is given in the annual report and is quoted elsewhere.

connects with the main shaft of the Ohio mine and through it with the Mascotte adit. From the 'Sub A' pit to the top of the mountain the vertical distance was 1600 ft., but now that the crest has been removed the total height is 7700 ft. above sea-level. The lowest working in use is the 'A' pit, which is 105 ft. above the 'Sub A'. When we began our walk, a steam-shovel in the pit was puffing lustily as it loaded a train of five cars, each shovel, or 'dipper', transferring 7 tons from the pile of ore that had accumulated at the foot of the slope. The

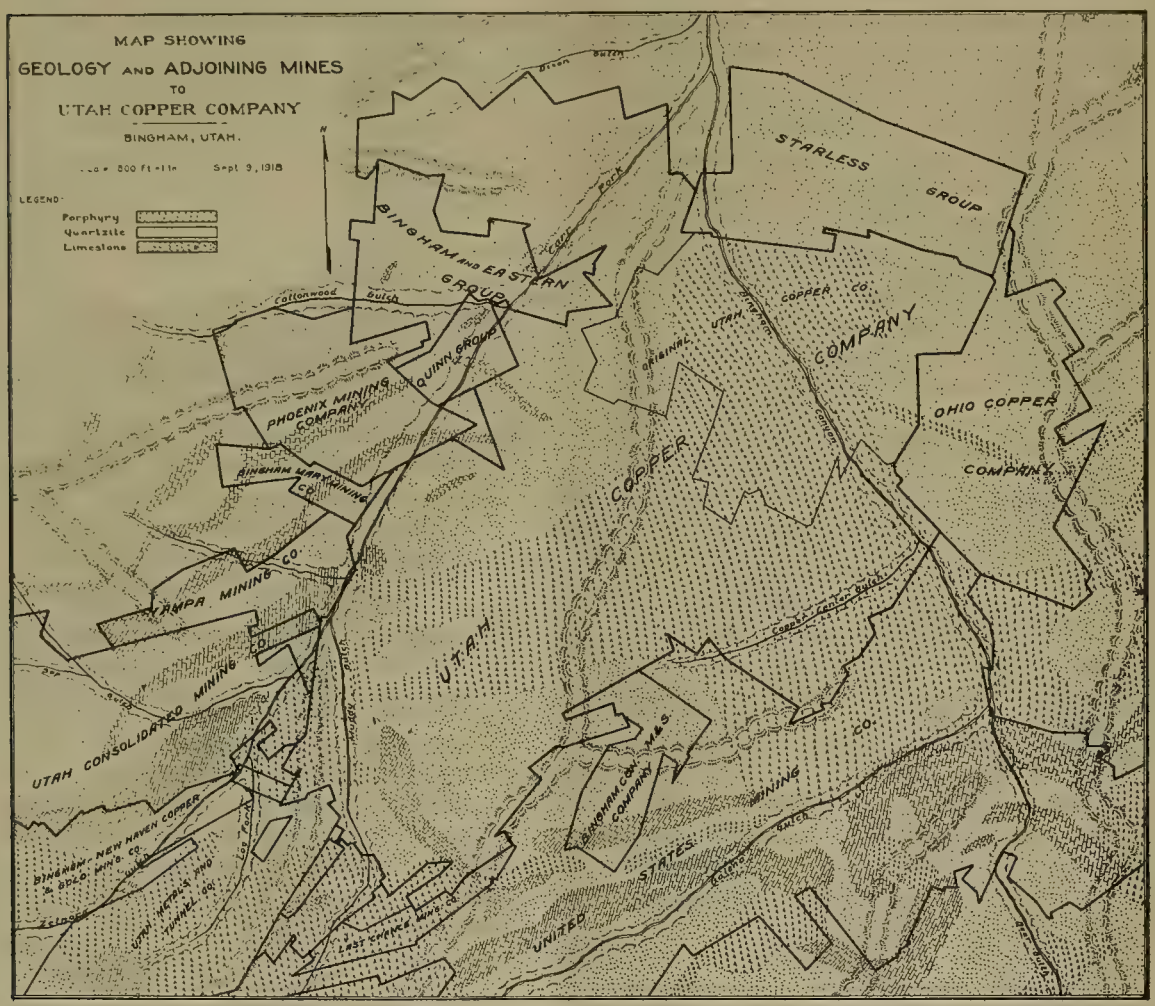

FIG. 2. GEOLOGY OF BINGHAM, AFTER U. S. GEOLOGICAL SURVEY, BUT REVISED AND CORRECTED TO DATE

main, or F, level is 240 ft. higher. On the face of ore—a cliff of gray rock—one could see men, like black ants, so small they seemed in contrast to the size of the excavations. These 'bank-men' were 'barring down' loose ore so that it might descend and accumulate like an artificial talus on the floor of the pit ready for the steam-shovel. Like cats they clung to the precipitous face, holding to a rope suspended from above. The banks slope at an average angle of 50°. The terraces are from 40 to 250 ft. wide, averaging 100 ft. in width. These 'bank-men' are Italians, probably from the Val D'Aosta, mountaineers and smugglers such as I used to employ when manager of the Grand Clos silver-lead mine on the French-Italian border near Briançon in 1891. I noted a man pouring water from a barrel into a pipe leading to the drillers below, on the face of the cliff. Walking along the F level, we came to a group of men engaged in drilling. The crew consisted of a machine-man with two helpers. The drill was an Ingersoll 3½-in. machine, known as F 24. The holes are made 30 ft. deep in the floor of the terrace, and not quite as long—28 ft.—in the face. When starting, a box is put around the collar of the hole, in order to exclude loose bits of rock; this is covered with a scrap of paper (no part of a treaty) from the dynamite-box and kept in place by a stone until the time comes to load the hole and blast it—which time arrives when ore is needed directly below, that is, when the steam-shovel moves to that part of the pit. The dynamite is Red H, No. 4; it is 80% ammonium nitrate and 10% nitro-glycerine, but it is marked 60% in order

to make the men careful. The explosive[9] is manufactured, as previously stated, at Bacchus, by the Hercules Powder Co. Black powder is no longer used; it was employed in the short drifts, or 'gophers', that were driven into the hill at the start as part of the system of 'bank-blasting'.[10] On the top level, however, it is still the custom to use black powder in the Keystone drill-holes. No. 3 Keystone machines are used to drill the bank on the two uppermost terraces. They have been found economical at these particular levels because the banks are relatively high and the terraces wide. During June 369,050 pounds of explosive was used in shifting 1,035,103 cubic yards of rock. The holes are chambered at the bottom so as to make room for the effective use of the maximum possible amount of dynamite at the bottom. The signal indicating that the hole is about to be 'sprung' is one long whistle followed by three short ones. The dust and gas shoot forth like a geyser. Two long whistles signify that the operation is finished. These signals, of course, are warnings to the men working in the immediate vicinity, particularly on the level below. All the way up the hill there are 'powder-men', who have to be informed before blasting of any kind can take place, in order to tell the workers when to move out of danger from flying stones. The man on the level above gives the warning and indicates the direction of safety. Three or four huts made of old railroad ties are distributed over each terrace, so as to afford shelter when a blast is in progress. Not many employees are hurt. A 'Safety First' campaign was organized several years ago, with the most beneficial results, and recently a 'safety engineer' has been appointed to supervise this department.

Looking at the nearest bank of ore, I noted that the general grayness was blotched with green where the copper sulphate, exuding by seepage, had dried. Toward the edges of the huge quarry the yellowish brown of the cap (oxidized monzonite and iron-stained quartzite) covered the gray ore-bearing rock. The best ore is a light-gray monzonite, the feldspar of which has been turned to sericite. At the south end is a darker and poorer monzonite, and to the north is the quartzite. The brown cap, with its copper carbonate, staining it in patches of green and blue, is broken independently, for separate treatment, as we shall see. Not much of the quartzite is ore. All that is not 'ore', and therefore 'waste', is removed into a neighboring gulch, so as not to interfere with the excavation of ore. As the eye ranges over the successive levels and envisages the scene, it is difficult to realize that 1800 men are at work, for only those near-by are visible. The younger Rockefeller (John D. Jr.), when here a year ago, said: "It is the greatest industrial spectacle in the world"—and he ought to know.

The hill, now cut and scarred beyond the recognition of the pioneers, is honeycombed with 60 miles of underground workings, which were made chiefly to explore the orebody and to ascertain its dimensions. See Fig. 1. This work was done between 1900 and 1915. For three years, from April 1904 to June 1907, all the ore that was milled came from underground stoping and development, but subsequently, as the stripping of the hill advanced sufficiently to permit of systematic open-air mining, a steadily increasing proportion of ore has come from the steam-shoveling operations, until in March 1914 no more ore was broken underground. Fully 6,250,000 tons of ore has been derived from the underground workings, besides 1,518,691[11] tons mined by the Boston Consolidated company before its mine was merged with the Utah Copper. The east hill opposite likewise has 27 miles of subterranean excavations, riddling the monzonite and quartzite, but it still retains its cover of grass and brush, amid which copper-stained croppings can be seen similar to those that incited intelligent interest in the west hill, now completely stripped of its covering of verdure and soil. The earliest mining done by the Utah Copper company was on this eastern side of the canyon; a caving of the surface above old workings shows where the first ore was broken for milling at Copperton in 1904. At the foot of the hill, in the bottom of the canyon, was the little Rogers mill where D. C. Jackling made his mill-tests in 1899. Nothing remains of that 'historic' apparatus.

Each level, or terrace, has one line of pipe for compressed air and another for water. The steam-shovel track is laid in 5-ft. sections. Every time the shovel makes a cut, 20 to 25 ft. wide, the track and the two pipelines have to be shifted. The laborers are divided into 30 gangs, of 8 to 20 men. These gangs are not assigned to any particular level, but are shifted as required. The first gang that I saw consisted of Albanians. The steam-shovel moves on a track that is 25 ft. from the one on which are the cars to be loaded. A train of five cars receives the ore as it is dug and loaded by one steam-shovel operating a dipper having a capacity of 3½ cubic yards, equivalent to 7 tons of ore. Above the J level the larger engines are in use; each of these pulls 10 cars. The company uses 21 steam-shovels, of which 15 are Marion model 91, 2 Marion model 60, 2 Bucyrus 95-C, and 2 Atlantic 80. Watching a steam-shovel at work, I recalled similar operations that I saw in the North while

[9]In the monthly statement of 'Coal Mine Fatalities in the United States for March 1918,' the following description of Explosive Red H No. 4 is given: "Volume of poisonous gases produced per one and one-half pounds, more than 53 to 106 litres. It belongs to the ammonium nitrate class containing a sensitizer that is in itself an explosive. It is permissible only when fired with a detonator (preferably an electric detonator) of not less efficiency than No. 6. The average weight of 1¼ by 8-in. cartridges is 164 grammes. It is permissible in diameters of ⅞ in. or larger. The unit of deflective charge is 248 gm. The rate of detonation in 1¼-in. cartridges is 8980 ft. per sec. (2738 metres per second). It is manufactured by the Hercules Powder Company, Wilmington, Delaware."

[10]Courtenay De Kalb. 'The Utah Copper Mine.' M. & S. P., April 10, 1909. Page 518.

[11]Of which 1,072,921 was mined in the monzonite and 445,770 tons was heavy sulphide ore mined in the limestone and shipped direct to the smelters; most of it being copper ore and the remainder lead ore.

the Yukon ditch was being dug in 1908.[12] The 'similarity' began and ended with the machine itself, for the ground and the result of the digging were strangely different. There the moss had to be stripped from the frozen ground before the steam-shovel, burning wood, could set to work. Labor cost $6 per day, including $2 for board, which seemed preposterously high then, but in these War days no longer warrants exclamatory remark. The difficulty of digging the Yukon ditch was not rock but ice, which is harder to conquer. All the steam-shovels at Bingham are covered with sheet-iron in order to protect the crew from flying stones. The machinery itself is protected by a housing consisting of 3-inch plank covered with ⅛-inch sheet-iron. The crew consists of one engineer, one crane-man, and one fireman—all Americans—besides a pit-crew of five men, usually Greeks, whose duty it is to lay the 5-ft. lengths of rail ahead of the shovel, loosen and tighten the jack-screws when the shovel is moved, and keep the loading-track clear of broken ore.

(To be Continued)

SHIPPING locked through the Sault Sainte Marie canals, both American and Canadian, during five months this season, included mineral tonnages as shown below:

	1918	1917
Eastbound:		
Copper	53,004	75,342
Iron ore	38,734,187	35,476,517
Westbound:		
Coal	9,222,706	9,125,329
Iron	24,438	63,698
Iron ore	74,928	38,005
Oil	209,266	.....
Salt, barrels	52,615	338,153

The total of all commerce in 1918, to August 31, is 50,400,698 tons, a gain of 492,198 tons. Ships numbering 12,390 passed through, a decrease of 731 vessels.

Traffic through the Suez canal, a sea-level waterway, totaled 2353 vessels and 8,368,918 tons during the whole of 1917. In 1913, a normal year, the tonnage was 58.23% greater. The toll charge is 24.1 cents per ton.

CAST-COPPER tuyeres and coolers for blast-furnaces offer advantages over the old type of cast-iron tuyere, according to A. K. Reese, in 'Engineering'. The greater first cost of the copper is more than offset by the greater economy in operation that can be obtained. Tuyeres of rolled, hammered, or pressed copper are even more desirable than those of cast-iron, being more homogeneous and more resistant to abrasion.

GANISTER used in Scotland successfully as a lining for retort-ovens in by-product coking, according to A. K. McCosh, has the following composition: SiO_2 80.8%, $Al_2O_3 + Fe_2O_3$ 17.8%, CaO 0.8%, and MgO 0.07%. The bricks made of this material are highly resistant when the gas is carefully regulated, and such lining will last from seven to ten years.

Potash From Cement

In potash recovery the field of application that has been developed furthest is in connection with cement-kiln gases. Several plants are now in successful operation, and a considerable tonnage of potash is being obtained. Other plants are under construction, and the outlook for a large increase is favorable. In the issue of the 'American Fertilizer' of August 31, 1918, John J. Porter, general manager for the Security Cement & Lime Co., of Hagerstown, Maryland, gives much valuable information. He says, regarding the estimation of potash recovery or for the benefit of those who may wish to figure on their own conditions:

"I give the following method of calculating the probable recovery of potash:

Let A = per cent potash in raw mix.

B = per cent potash in clinker.

C = per cent liberation = $\frac{600A - 380B}{600A}$

F = pounds of potash recombined per barrel of clinker = 0.7 to 1.5, depending on fuel consumption and per cent of ash in coal.

P = per cent potash precipitated in treaters.

Assume 600 lb. of raw mix actually used to make 1 barrel of clinker.

Then—Pounds of potash entering kilns per barrel of clinker = 600 A.

Pounds of potash volatilized in kilns per barrel of clinker = 600 AC.

Pounds of water-soluble potash entering treaters per barrel of clinker = 600 AC-F.

Pounds of water-soluble potash collected in treaters per barrel of clinker = (600 AC-F) XP.

The cost of collecting potash at Security is now about as follows:

	Per unit of potash, cents
Collection, including labor, power, repairs, and laboratory	14
Packing and shipping	8
Total operating cost, exclusive of depreciation, royalty, and salt addition	22

The cost of the salt addition is about 25c. per unit of potash, but this is not a necessary element of the cost, and can be omitted whenever the conditions affecting the price become such as to give an unsatisfactory margin of profits."

The article shows that from a 3000-bbl. cement plant the operating profit per annum on the potash alone is about $458,000, the raw mix containing 0.75% of potash. The article is replete in details.—Linn Bradley in 'Manufacturers Record.'

WHITE ZINC SULPHIDE has not been imported during the year in quantities as large as formerly. The price of the precipitated ZnS during the last quarter averaged 31c. per lb. The use of this substance will be greatly extended when it is made available at lower figures.

Inflation and Business After the War

*The effects of inflation have been visible for some time in wages and the prices of commodities, but not in the prices of securities or of real estate. This fact is the subject of much inquiry and comment. If inflation is a factor of general import, as it is supposed to be, affecting the purchasing power of money, why doesn't it show in the prices of bonds and stocks and of real estate? What is modifying or retarding its influence in these quarters, and will its effects appear in these prices later?

As the first step toward any discussion of inflation it is necessary to have an understanding of the term. Some persons apply it only to an undue expansion of paper currency, but an expansion of bank loans and deposits has the same effect, since checks are now the common medium of payments. Others in referring to inflation have in mind a general state of abnormally high prices incidental to great industrial activity, whatever the primary cause may have been. Many people argue that the inflation of credits at this time is wholly the result of the war-demands, but they take no account of the part played by an increased supply of credit or money in facilitating the demands. In time of peace a country's industries are occupied in supplying its consumptive wants and in construction work to enlarge its powers of production. If, when a country goes to war, it would curtail these accustomed demands enough to offset the new war-demands, there would be no rise of prices. But people do not curtail their accustomed demands to any such extent. They go on trying to buy and consume as usual, and since there is not labor enough to do everything, employers raise wages to get labor away from each other, and all prices and costs rise. More credit is required to handle all business under these conditions, but whatever amount of credit is supplied is quickly absorbed, because the bidding for labor and materials continues. In short, each new supply of credit finances a further rise of prices, because costs and prices follow each other around a circle.

It is this relation of credit to price inflation that we are now discussing. The prevalent idea seems to be that since an undue expansion of the medium of exchange has the effect of diluting and depreciating it, the depreciation should be the same in relation to all kinds of property. This is not the effect, for the simple reason that there is not an equal demand for all kinds of property. In other words, the depreciation of the currency, or purchasing agency, does not occur simply as a result of increasing quantity, but from increasing competitive efforts to exchange it for something else. If there was no attempt to use enlarged purchasing facilities there would be no effect upon prices. There is no abstract calculation or measurement of values, but an ordinary operation of the law of supply and demand. A greater relative supply of currency, accompanied by strenuous efforts to exchange it for certain things which are of immediate importance, causes the currency to lose purchasing power with relation to those things.

The primary cause of this great rise of wages and prices of course is the War. It has taken millions of men from the industries and set up an enormous demand for the war supplies.

After the War is over, there will be a change of all conditions. When the Government orders are finished and paid for, unless a similar volume of equally urgent demands spring up from new sources the inflation of credits will subside. Bank loans and deposits will decline and the percentage of bank reserves will rise. This would mean a readjustment of values toward the pre-war basis. Evidently the course of this readjustment will be governed by the industrial situation and prospects at that time. If the transition from war conditions to peace conditions is fortunately accomplished; if industry is well sustained and free from disorganizing controversies, so that both the investing and consuming power of the country is large, the establishment of a feeling of full confidence is likely to be followed by one of the greatest periods of construction and expansion the country has ever known. The future of wages, prices, and values in general will depend upon harmonious, highly-organized, efficient, well-balanced industry, creating new wealth at a rate sufficient to satisfy the growing wants of the people.

Will this state of inflation end with a collapse of credit after the War? It is safe to say that the credits which have been created for war purposes in this country will be generally liquidated at the end of the War without losses, because they rest at last upon the credit of the Government. When the Government purchases fall off and its contracts are liquidated, there will be a general liquidation of private indebtedness related to war work, and war work is now the chief factor in industry.

There has been no considerable expansion of credit outside of the war industries. Building operations and new construction of all kinds are at low ebb, except as related to the war industries; real estate is inactive, loans for the purchase of stocks and securities are lower than usual, and the prices of stocks, bonds, and real estate are below rather than above the normal level.

These are not the conditions under which panics occur from an over-extension and collapse of credit. It is evident, therefore, that although an abnormal expansion exists at this time the situation is different from that of a boom period, when credit is over-extended upon the basis of more or less speculative private enterprises, about which confidence may be eventually weakened. The statements of corporations generally show that their

*Bulletin, National City Bank, New York, October 1918.

financial condition has improved in the last three years. They have made only moderate distributions from earnings, have reduced their bonded indebtedness, and although current indebtedness is large, that should be covered by the orders in hand.

A tight rein is being held upon every tendency to use credit outside of essential purposes, and there is little temptation or opportunity to use it along venturesome lines. As a result there is less uncertainty about the credits of the country than in ordinary times, and there is no danger of anything like a general breakdown or panic while the present situation exists.

The danger of a credit collapse will come, not in the liquidation of the credits now outstanding, or of succeeding credits based upon war business, which practically have the credit of the Government behind them, but at the end of the boom period, if there should be one following the War, when credits will have nothing behind them but private enterprises and promises, and the whole situation is based upon an inflated and uncertain state of values.

We may expect that after the War there will be a waiting demand for many kinds of goods and equipment so urgent that for a time price will be a secondary consideration. The whole world is doing without things that it would gladly buy, wearing out equipment and falling behind its wants. It is falling behind in house-building, for example, in road-making, in railway extensions and in the development and improvement of public utilities. Automobile construction has nearly ceased, and the cars in use will be nearly worn out. Clothing will be worn out the world over, and stocks of cotton will be low, therefore there will be a good market for cotton and our cotton States should be prosperous. Not only is there the rebuilding and rehabilitation of the war-devastated districts to be done, but the development of the backward countries looms up with more definite and immediate promise than ever before. The world is not going to seem so large, or its divisions so separate and distinct from each other as in the past. Foreign countries will not appear so remote and difficult of access to Americans. Undeveloped resources, which will contribute to the comfort and welfare of mankind, will not be neglected anywhere if stable government and protection to investments can be had. The stir of the War will be in the blood of all nations and the impulse to do things will be manifest. These are the conditions favorable to a period of enterprise and activity, and which will tend to sustain prices or moderate their decline.

Nevertheless, it is inevitable that prices will be upon a declining scale and this will be the factor of uncertainty and danger in the situation. Falling prices, shrinking values in inventories, stocks of goods, and capital investments, have a depressing influence. It is comparatively easy to make money when prices are rising; the most venturesome may be the most successful then. Errors of judgment are made good by something outside the management. Farmers of even indifferent skill, who could make but a poor showing of profits from their farming operations, have become well-off from the rise of land values. The situation is very different with prices on a declining scale, for then not only is there no margin furnished gratuitously by an unearned difference between buying and selling prices, but a portion of the normal earnings is lost, and as net earnings decline, capital values shrink, credit is unfavorably affected, and indebtedness becomes relatively heavier and more burdensome. Therefore it is in order to give warning against incurring indebtedness, which will reach over into the period after the War, when prices and earnings will be lower than now.

There is another reason why prices must come down after the War, and that is that unless they do the monetary systems of the whole world will have to be re-organized in a manner which will not only do great injustice to all persons who hold a creditor position, but involve business affairs generally in such confusion as will disorganize production and the exchanges and occasion losses to all classes.

The monetary systems of the world almost without exception, are now based upon gold. The monetary units of nearly all countries are fixed in terms of gold, and since they all have a fixed relation to the grain of gold it follows that they have a definite relationship to each other. This is favorable to international commerce and financial relations. China has been the only important country whose currency was not related to the gold standard, but its government has taken steps within the last month for establishing such relationship. The great service of this common unit of value in world affairs is illustrated and emphasized at the present time by the difficulties which arise because temporarily the free movements of gold are interrupted.

But the present rise of prices has destroyed the normal relationship between gold and other commodities. Gold is priced in terms of itself; an ounce of it will bring $20.67 at the United States mint, because at the coinage rate an ounce will make that amount of money. There is no magic about the act of coinage. The word 'dollar' is simply the name given to 25.8 grains of gold nine-tenths fine. The Government does not attempt to determine the exchange value of the 'dollar'; that depends on the law of supply and demand, and unfortunately for the gold producers there are other ways of producing dollars than by digging gold, and just now there is a great output of 'credit' dollars. Since there are restrictions upon the disposition of gold outside of the mint, he can get no more than the mint price, and the cost of mining gold has risen until mines of low grade are working at a loss or closing down, thus reducing the new supplies.

The production of gold cannot be maintained at its present valuation in relation to other commodities. That is to say, with labor, coal, machinery, chemicals, and other supplies necessary to its production at present prices, gold cannot be produced at a profit to be coined at $20.67 per ounce.

While the War goes on, credit will be artificially elastic in order that the necessities of the Government may be met, and the risk of credit expansion is minimized, as

stated above, by the fact that Government credit is so largely behind the situation; but when the War ends this reduction in the output of gold is bound to make itself felt in the credit situation. The normal additions to banking reserves will not be made, and credits will be correspondingly restricted, with the result that prices will decline. The influence is the reverse of that which has been seen from rapidly increasing bank reserves.

In short, the level of prices has a definite relation to the standard of value. Following the discovery of the South African goldfield, and of the cyanide method of treating ores, the world's production of gold increased rapidly, and a period of what was called 'gold inflation' and rising prices ensued, lasting down to the outbreak of the War, although the rate of production was practically at a standstill for several years before the War. The amount of bank credit available before the War was related to the bank reserves, and the level of prices the world over was adjusted to this relationship. It is possible, temporarily, by the use of Government credit, to sustain a higher level of prices without a corresponding increase of gold reserves, but it cannot be done permanently. The circulating credit must be freely convertible into the standard of value, if prices are to have any definite relation to the standard, or if prices in different countries are to have any definite relation to each other.

In short the prices of other things must come down in relation to gold if gold is to remain the standard of value. Under the present relationship gold production will stop, and bank reserves will be at a standstill until prices fall sufficiently to allow gold production to be resumed.

Professor Irving Fisher has proposed a new feature for the commodity standard. His proposal is that we continue to base our currency upon gold, but that the amount of gold represented by the paper dollar be changed from time to time in order to maintain a substantially fixed relation between the 'dollar' and the value of commodities. In other words, the 'dollar' would be 'corrected' from time to time to conform to prices, and to keep the average of commodity prices at a uniform level. By this means the gold dollar would be a compensating balance for the commodity unit. If the list of commodities adopted as the standard showed a tendency to rise, on the average of them all, it would be taken as a sign that gold was becoming cheaper, and this would be corrected by putting a little more gold in the dollar. If, on the other hand, prices showed a tendency to fall, this would be accepted as proof that gold was becoming dearer, and a grain or fraction thereof would be deducted from the dollar.

It will be seen that Professor Fisher's object is to stabilize prices and relate the currency and all credit instruments definitely to the prices of commodities, something in itself undoubtedly to be desired. If this system had been in force when prices began to rise, in 1915, instead of a reduction in the gold content of the dollar, or a bonus for gold mining to offset the rising costs, or any other action calculated to maintain gold production, the miners would have been promptly required to give an increased amount of gold for a dollar, and the required amount would have been increased as fast and as long as commodity prices advanced, not only to the extent of closing down the mines, but to the extent of melting down our existing gold coins to make them represent a smaller number of dollars. In other words, the system would continue to put more gold into the dollar, until the point was reached where prices in terms of gold stopped rising.

Nobody claims that gold is an ideally perfect standard of value, or that fluctuations in prices which are due to fluctuations in the production of gold are not to be regretted. One by one, however, the countries have come to the gold standard, because it has greater advantages, stability included, than any other standard of value ever in use. It has the one great advantage over any theoretical system in its simplicity, and another great advantage in the fact that all the world has adopted it. The primary purpose of a standard is to provide a common basis on which to do business, and the business world is slow to listen to proposals which it does not readily understand, and which it is very sure other countries, for the same reason, will not readily adopt. Granted that it is very desirable to have the whole business world thinking in common terms, and you once have that accomplished, no section of it is likely to be receptive to the idea of adopting a new language of values for itself.

Completed Figures for Gold and Silver Output, 1917

During the calendar year 1917, the United States mined 4,051,440 oz. of gold, valued at $83,750,440, and 71,740,362 oz. of silver, valued at $59,078,100, according to a report compiled by the Bureau of the Mint and the Geological Survey, made public on October 1. The volume of the silver mined during 1917 was estimated on the average of the New York dealer's buying-price during that period of 82.35c. per ounce. The price in 1916 was 65.66c.; 49.68c. in 1915; 54.81c. in 1914; 59.79c. in 1913; 60.83c. in 1912; 53.30c. in 1911, and 53.49c. in 1910.

In 1916 the gold output was worth $92,590,300, and 74,414,802 oz. of silver extracted, a reduction in the gold output of $8,839,600 and 2,674,440 fine ounces in silver production. In the calendar year of 1917, California led the whole of the United States in gold production, by turning out 1,012,461 oz., to the value of $20,929,400. Alaska was second with 709,729 oz., valued at $14,671,400; Nevada next with 335,361 oz., valued at $6,932,500; South Dakota, 356,662 oz., at a value of $7,372,900, an increase of 250,613 oz., valued at $1,180,600, the remainder of the States contributing smaller amounts to the total.

In silver production, Montana led all others with 14,555,034 oz., valued at $11,986,100. Other States producing large quantities of silver during 1917 were Idaho, with 11,402,542 oz., with a value of $9,390,000; Nevada, 11,217,654, valued at $9,237,700; Utah, 13,360,905, valued at $11,022,000; Colorado, 7,291,495, valued at $6,004,500; and Arizona, 6,962,257 oz., valued at $5,733,400.

THE CLIMAX MOLYBDENUM COMPANY'S MILL

Recent Developments in Molybdenum

By L. F. S. HOLLAND

It is reasonably expected that since a steady source of supply of molybdenum now is assured, the manufacturers of alloys will be encouraged to use this valuable metal in greater amounts than heretofore. Temporarily, the quantity of molybdenum ore and concentrates offered may exceed the demand, and there may be a still further drop in the price, which is about $1 as compared with the price a few weeks ago when these materials were selling in the Eastern market for $2.20 per pound of contained molybdenum sulphide. Ultimately, the market should show more stability, and it is hoped by the operators of molybdenite properties that the price will be at least as high as the British government's price during the War, namely, five guineas per unit, or about $1.25 per pound.

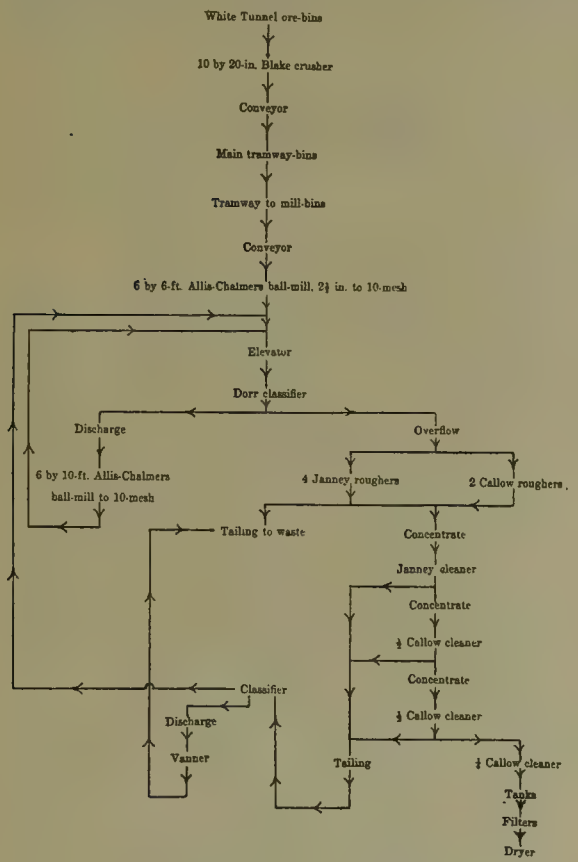
The outlook for wulfenite (molybdate of lead) concentrates in the near future is more doubtful, as there is no encouragement to consumers to use the limited capacity of their plants in treating wulfenite, or slag from wulfenite, comparatively low in molybdenum, even if the lead contained costs them nothing, when plenty of molybdenite much higher in molybdenum is available. However, it is hoped that such mines as the Mammoth-Collins in Arizona, which might supply a large quantity of wulfenite concentrate if there were a better market, may be benefited ultimately by a greater use of molybdenum.

The development of the property of the Climax Molybdenum Co., at Climax, Summit county, Colorado, has set a new standard of comparison for molybdenite mines in the United States. Instead of the common type of rather small deposit, operated precariously as an irregular market for molybdenum products may allow, the Climax has several million tons of commercial ore developed, and an excellent mill already treating about 250 tons per day, which is to be enlarged in the near future as the demand for molybdenite increases. The Climax mine is on Bartlett mountain, on the Continental Divide, about 15 miles north-east of Leadville, Colorado. The elevation of Climax station, on a narrow-gauge branch of the Colorado & Southern railroad, close to which is the mill, is 11,303 ft. above the sea. The mine is about a mile farther east, and the two principal tunnels are at an elevation of about 12,100 and 11,900 ft., respectively. Operating conditions in this mountainous country are difficult, owing to large amounts of snow during the greater part of the year. However, the mill, the wire-rope tramway between the mine and the mill, and several buildings, were erected during the past winter. The operators deserve great credit for accomplishing so much in so short a time, and under such trying climatic conditions. The purchase of the property, development, and erection of plant, have called for an expenditure of about $600,000. The molybdenite orebodies occur in two hills of alaskite-granite, north-west and south-east of the gulch. Only the north-west hill has so far been developed to any extent. The developed mine is on the original five claims, each 150 by 1500 ft., on the north-west hill. The Molybdenum Products Co. also has one developed claim, 150 by 1500 ft., on the north-west hill. Various parties, including the Climax company, have claims on the south-east hill.

The alaskite-granite has intruded an older gneiss, and a large zone in the alaskite-granite has been fractured and further silicified. Chunks of the gneiss are occasionally included in the alaskite-granite. Areas of quartz-porphyry containing little or no mineral also appear. The molybdenite occurs in a finely disseminated form in the quartzose masses and veinlets in the silicified zone. A typical piece of ore, shown in the illustration,

reveals criss-cross veinlets with fine-grained molybdenite, like pencil lines. It resembles some of the disseminated copper ores at Bingham, Utah, and at Burro mountain, New Mexico. The molybdenite, however, is primary, and was apparently deposited with the silicious material by magmatic segregation from the cooling and solidifying mass of alaskite-granite. The obviously pegmatitic bodies, commonly associated with molybdenite deposits, are not here in evidence. Some pyrite, and a little chalcopyrite, are found. No coarse or flaky molybdenite in cleavage and fracture planes is observed in the Climax deposit. Molybdite, the yellow oxide, appears in considerable amount, however, where oxidation has been favorable through the agency of circulating waters.

The part of the Climax company's orebody completely



FLOW-SHEET OF CLIMAX MILL

developed measures about 800 by 800 ft., with 'backs' said to average about 250 ft. Additional development work from the lower tunnel is expected to increase the ore-reserves considerably. The alaskite-granite area, part of which is ore-bearing, is limited by its east-west and north-south contacts with the gneiss. In the lower tunnel an east-west contact dips about 70° to the southeast. A contact also shows in a well south of the railroad track. The orebody is developed by parallel drifts 25 ft. apart, 800 ft. long. It is intended to carry shrinkage-stopes to the surface from these drifts and afterward break down the intermediate pillars. It is possible that ore may be broken from the surface into 'glory holes', but the excessive amount of snow at this elevation would be troublesome. Six stoper-drills and four piston-drills take care of the stoping and development work. As the result of a certain amount of selective mining, the ore sent to the mill is said to have assayed about 0.8 to 1% molybdenum sulphide, of which an appreciable proportion should be reported in terms of molybdic acid on account of the molybdite content. To estimate the average mineral content of so large an orebody, it may be a case of having to eat one's cake to find exactly of what it is composed. From the inspection of a large number of molybdenite deposits, I would guess that the average assay of the Climax ore would be about 0.6%, but molybdenite ores are often deceitful in appearance. The official estimate of 1% of molybdenum sulphide is doubtless based on systematic sampling.

In the milling of such an ore by table-concentration and flotation, the molybdite (yellow oxide) is practically all lost. It may be saved, if in sufficient quantity to be worth while, by solution in a cheap special alkali, by a patented process. It may be noted that the flotation of the Climax ore is performed in an alkaline solution.

The concentration ratio is 1:125. The extraction is said to be about 70%, or about 11 lb. molybdenum sulphide to the ton, in a concentrate assaying about 65% molybdenum sulphide. The endeavor is to keep the pyrite content in the concentrate under 9%. There is practically no chalcopyrite to contend with. The mining costs are understood to be approximately 70c. per ton and the milling costs about the same. It may be possible, perhaps, to produce concentrate at an operating cost of 40c. per pound of molybdenum sulphide.

The accompanying flow-sheet has been adopted in the mill.

In common with most mines in the West, Climax is suffering from a shortage of skilled labor, and this is likely to become increasingly acute until such time as the civilized world has accomplished its most important duty of thoroughly beating the Hun. Meantime the American Metal Co.'s interest in the Climax Molybdenum Co. will be taken care of by A. Mitchell Palmer, as administrator of enemy alien property. The Climax Molybdenum Co. is fortunate in having an able and efficient technical staff. As might be expected with men of this character in charge of operations, the air of mystery and secrecy which so often pervades small rare-metal plants is conspicuous by its absence. For many courtesies, I am indebted to Harry L. Brown, chief of the mining department of the American Metal Co., to O. R. Whitaker, consulting engineer, Webster P. Cary, superintendent, and James R. Welch, mine superintendent. John H. White, the manager, was absent at the time of my visit.

The Molybdenum Products Co.'s mine is included in one narrow claim, but, though much smaller than the Climax Molybdenum Co.'s mine, it has considerable ore-reserves. It has a 600-ft. tunnel, with laterals 150 ft. long and 50 ft. apart. Stopes are carried 12 ft. wide with

ore-chutes about 12 ft. apart. The Molybdenum Products Co.'s mill is not open for inspection, but is understood to consist of three Telsmith crushers, breaking the ore by stages down to one-quarter inch mesh; two 64½ Marcy ball-mills, grinding to minus 50-mesh; a Dorr simplex classifier, to be replaced by a duplex; four Deister tables; a four-cell K & K flotation machine, working with an alkaline solution and pine oil; and a cleaner of local construction, somewhat like the Callow apparatus. A light froth is desirable with the Climax ores. It appears to be the intention of the Molybdenum Products Co. to make a high-grade concentrate, assaying 90 to 95% molybdenum sulphide. M. S. MacCarthy is in charge of the company's operations, and Morgan Williams is mine superintendent.

POLISHED SPECIMEN OF CLIMAX MOLYBDENUM ORE

The published technical literature on the metallurgy of molybdenum is apt to be sketchy, and is not always reliable. There is room for much pioneer work in the investigation of the properties of alloys of molybdenum. Henry Ford's organization has accomplished something in this direction and is notable for installing a Greaves-Etchell's electric furnace to help in the investigations. The Metals Reduction Co. is making ferro-molybdenum at Washington, Pennsylvania, and it is understood that the Acme Steel Co. will shortly begin the production of molybdenum steel at a site acquired for that purpose at Glassmere, Pennsylvania. It is, of course, well known that molybdenum imparts properties to tool-steel similar to those given by tungsten. It is less well known that very small percentages of molybdenum, with or without copper, give steel an enormous tensile strength. The use of such small percentages on a large scale would considerably increase the consumption and demand for molybdenum. Sooner or later it will come into its own.

FELDSPAR disintegrated and mixed with carbon and sufficient lime to produce a readily fusible slag and heated to a high temperature in an electric furnace, results in part of the alkali of the feldspar being reduced and combining with carbon and nitrogen to form KCN, which, with other gases formed, escapes from the furnace and is collected. The Al_2O_3 and SiO_2 contained in the feldspar form slag with the lime, which is tapped off. Other alkali-metal silicate-bearing materials, such as mica or alum-slate, may be used, and if alum-slate is employed the hydrocarbons that it contains take the place of part of the carbon otherwise needed. The impurities which the raw materials contain cause the formation of various compounds other than cyanide, for example, cyanates may be formed. The electric furnace may be of the type shown in U. S. patent No. 1,186,921. The above method is covered by patent No. 1,264,949, issued to A. R. Lindblad.

CAUSTIC SODA is quoted at 3⅜ to 3½c. per lb. for 1919 delivery. Ground and powdered caustic is now selling in the open market at 5 to 5½c., with flake 76% firmly held at 6 to 6½ cents.

A Letter From the Front

We went over the top this time and sure gave the Huns hell. This division was the first over the top in the first great American and Allied offensive; this regiment was first to go and my company was the first over as the second battalion of the 23rd was the attacking party. We drove the Huns back eight miles in less than three hours and captured much of their artillery, a great many machine-guns, some aeroplanes, anti-aircraft guns, heavy artillery, a great many prisoners, including a General and his staff, and many other high German officers. A man in this company captured the General and two colonels. We took a few towns and in three hours did what they expected would take us two days. We went over again the next day and drove them back about six miles more.

It was the greatest battle I have seen so far. The Huns were taken by surprise. We were taken off one front and rode all day in trucks and hiked all night and did not even get a breathing spell before we started over the top. It was very still on the front, only a shell landing every few minutes till two of our guns spoke out at 4:45 a.m., which was the signal for the artillery; then such a noise! It was like the rumble of a thousand great rolls of thunder, and kept up all the time we were on the front and is still going. I brought in twelve prisoners and three were killed and one wounded when we were re-crossing the German fire. I did not get a scratch. I thought I was doing well, but some fellows brought in as many as four hundred. We did not lose very many. Most of the losses were slight wounds in legs, arms, and head, from machine-gun fire and shrapnel.

Just got through eating. We had mashed spuds, roast beef, gravy, white bread, and coffee. We get just as good most all the time, but there have been times when we got nothing and could not even get water. I have had the experience of dying for a drink of water and never knew before what it was like to go without water until my tongue felt like a piece of leather, my throat was burning up and my lips were cracked. I went all over the battle-field looking for canteens, but they were all empty. I picked up two Hun canteens, so when I did find water I filled up the two besides my own and had enough to last a few days, but it did not last more than two hours as there were lots of men coming back wounded who needed it more than I, so I had the thirst craze all over again, but not as bad as the first time. I will tell you my own story. We left the town in trucks at night. The one I was in got stuck in the mud and we worked all night getting it out. We were five hours behind the rest of the company and had to hike eight miles to where they were. They had five hours sleep, besides the time it took us to hike the eight miles. We got some hard tack and a cup of coffee and were just in time to start out with the rest.

We hiked ten miles more to the front and were just in position when our artillery opened up. I was in the second row so had to lay on my stomach until the first got started. There were two killed and two wounded within ten feet of me. The shells were breaking thick everywhere around us. The air was a steady screech of shrapnel and bullets. We got the order to move forward and started out. The shells were coming faster now and many more big ones. We advanced in the open through a wheat-field and plunged into some machine-guns. We had to do a tight-rope stunt across the Hun line, but most of us got across, when a great many Huns came out to surrender. Twelve came out in front of us and as I was the first man the Captain saw he gave me orders to take them back. So back I had to go with that wild twelve, who all wanted to go in different directions. I made them hold their hands over their heads and succeeded in getting them in although three were killed and one wounded before I got them to safety. I had to take them to Division Headquarters, way back 18 miles again, turned my prisoners over to the officer in charge and went back, but could not find my company, as they had gone so far ahead, so I joined an officer who had about twenty more who were also lost.

We were passing through a town that was being shelled. We got just outside the town and were told to wait beside a bank, which gave us some shelter from the shrapnel. We remained there for two hours and were not told to move, so we, the other fellow and I, started out and found the officer had gone and two of the men had been killed and four wounded. The rest had disappeared somewhere, and as the shells were falling fast and we were in no safe place we went for a big barn that was near-by. It happened to be a dressing-station. The officer in charge was short of men, so with four German Red Cross men we made stretchers out of two poles and a blanket and worked until we were relieved, which was two days later.

I am in the best of health and have had a good two days rest and expect to start on a two days hike tomorrow, where we will get rest for an extended time before going to the front again. Robert is not here yet but I am in hopes he will be soon as some fellows who were in the same place came back yesterday and said he would be here in a day or two. He did not miss anything but about a hundred million pieces of shot the same as the rest of us lucky ones.

The Huns lost a great many men. One Hun officer that was captured said there were only 18 left in the regiment he belonged to. They left everything in a hurry in their retreat. We found cans of hot coffee and new hot bread just baked. There was a bugler from this regiment who started in with three prisoners. He trusted them and treated them like human beings, which they were not. One took advantage and when he wasn't looking stuck him with a knife, making a fatal wound. But he shot the whole three before he died. So you see all the things we used to read in the papers were not lies, but the truth. A sergeant in this company was going to take an officer prisoner; the Hun officer started to draw a pistol from under his coat, but the sergeant beat him to it and got his gun out first and shot the Hun through the neck and when a 45 goes off at close range it is no joke; it just blew the Hun's head clean off his shoulders.

The Terry Differential Flotation Process

By JOSEPH T. TERRY, JR.

This process, protected by U. S. Patent No. 1254173, of January 22, 1918, and Canadian Patent No. 184193, of May 7, 1918, is based upon the discovery that ammonia in solution promotes oxidation of metallic sulphides by air introduced into the pulp.

An experiment illustrating the oxidizing influence of ammonia may be made by wetting clean pieces of iron with water, and with ammonia hydroxide. Yellow ferrous carbonate soon forms on the iron wetted with water, while the piece of iron wetted with ammonia hydroxide becomes bright red with ferric hydroxide.

As the oxides of zinc, copper, and lead are soluble in ammonia hydroxide and most ammonia salts, these sulphides are cleansed and their floatability unimpaired, whereas iron oxide is insoluble and the oxide filmed sulphides (pyrite or pyrrhotite) are rendered immune to flotation.

As air drives ammonia out of a solution, a closed tank with a circulating system is the most economical in which to carry on the oxidizing reaction and conserve the volatile ammonia gas. The amount of ammonia required to accomplish this result depends on the character of the ore, pulp-dilution or density, time of contact and aeration. Solutions containing from 0.04 to 0.06% NH_3 were used in the tests recorded in the accompanying data.

Ammonia hydroxide or ammonia gas may be introduced directly into the pulp or generated in situ by decomposition of ammonia salts by alkalies, for example, ammonium sulphate and sodium carbonate.

In treating some complex ores containing zinc, copper, lead, and iron sulphides by this process, ammonia may be introduced with the frothing-agent in the form of an emulsion and good results obtained. With other ores this procedure fails to make a high recovery and it is necessary to give the ore-pulp a preliminary treatment with ammonia and air before introducing the frothing-agent.

In the differential flotation of some zinc-copper-iron sulphide ores, it was found necessary to substantially remove the ammoniacal solution by decantation and replace

with water before adding the frothing-agent, otherwise copper sulphides would float with the zinc sulphide. Copper thus floated showed a marked tendency to drop as the ammonia was eliminated in cleaning and re-cleaning the concentrate, and it appeared in the middling.

When ammonia is introduced into ore-pulp in conjunction with certain oils no differential action is manifested and all sulphides are floated. This is particularly true with coal-tar distillates. The most suitable oils for differential flotation are found among the wood products, especially neutral pine-oils and neutralized wood-creosotes.

As the oxide film or coating on the iron sulphides is only superficial, the best results are obtained in flotation cells giving the maximum amount of aeration and the minimum of scouring action. This is characteristic of the Callow pneumatic cell sold by the General Engineering Co. of Salt Lake City. Of mechanical types, the K & K machine put on the market by the Southwestern Engineering Co. of Los Angeles is considered efficient. There is evidence, but not conclusive proof, that an iron machine gives better results than cells constructed of other materials.

As a result of research for a period of over three years a vast amount of information relative to differential flotation of metalliferous sulphides has been acquired that cannot be given publicity at this time.

Although the accompanying data give some results of tests on zinc-iron sulphide ores, the process is applicable to differential flotation of other sulphides such as chalcocite, chalcopyrite, molybdenite, and graphite from pyrite or pyrrhotite. By a modification of this process good results have been obtained in separating galena from sphalerite.

The success of the process, like all others requiring addition-agents, largely depends upon the cost of such materials. Synthetic nitrogen products that can be reduced to ammonia are now manufactured in large quantities and afford a fairly cheap and abundant supply of this reagent.

EMULSIONS were discussed by W. P. Davey in the 'Physical Review' recently in which he gave a method that avoids the usual mechanical action. It was found possible to emulsify the oils used in making japan bases by merely heating them with an aqueous alkali solution, in this case NH_4OH, in an enclosed space. The emulsification was hastened by stirring with baffles at 30 to 60 r.p.m. Emulsions can be made therefore, (1) by adding all the alkali and a little H_2O, or (2) by adding all the water at the beginning. The first method gives an emulsion of greater fineness. All emulsions made as above form a surface scum on exposure to the air at room temperatures due to the CO_2 present, since air free from CO_2 gives no scum. A critical temperature exists, below which no scum will form, but above which the CO_2 seems to unite with the alkali in the surface-layer, forming an electrolyte, which breaks the emulsion at the surface, producing a scum. The droplets of the discontinuous phase of the emulsion are negatively charged, and this phase can be deposited upon the anode by electro-plating. The velocity of transport is of the same order of magnitude as the velocity of other colloids and ions at the same temperature.

DISCUSSING electrolytic zinc at the Colorado meeting of the A. I. M. E., C. A. Hansen stated: The requirement, and I use it in the singular, for the electrolysis of zinc is zinc sulphate, and zinc sulphate only. Most other elements found in the solution are harmful to the electrolysis of zinc sulphate. I never have found any that I could confidently say were beneficial. This requirement seems relatively simple, but when it is understood that this process is to be applied (generally) to a complex of ore minerals, it will be understood that the production of zinc sulphate, pure, of the standard strength, is not the easiest problem in the world. Yet it is only this problem that has stood in the way, for all time past, of the manufacture of zinc electrolytically. All of the factors necessary to the production of a solid coherent plate of electrolytic zinc were known long ago, but it is only recently that we have been able to produce this pure zinc sulphate on a commercial basis and in large quantities, and have been able to obtain the electric current at such a cost as to make the production of electrolytic zinc a commercial possibility.

ANTIMONY DI-OXIDE (SbO_2) may be prepared by heating Sb_2O_5 at bright redness, or by oxidizing Sb with concentrated HNO_3 and heating the resulting oxide at dull redness until constant in weight. When heated with concentrated HCl and KI, SbO_2 liberates iodine; the reaction proceeds according to the equation

$$2SbO_2 + 6HCl + 2HI = 2SbCl_3 + 4H_2O + I_2.$$

The iodine may be separated by distilling the mixture; if the distillate is collected in a receiver containing KI solution, titration with thiosulphate solution will give the quantity of Sb_2 present. Meta-stannic acid does not liberate iodine from KI under the above conditions, but the reaction is of little practical use for the estimation of antimony in the presence of tin, since alloys of these two metals usually contain other metals which interfere.—'Journal of the American Chemical Society.'

DEFINITION OF HARDNESS. W. Cawthorne Unwin, in 'Engineering', shows by mathematical analysis that the Brinell hardness-number is identical with Martell's hardness-number, provided both are expressed in the same system of units. It does not appear that the identity of the two has been pointed out before. In the Martell-test a weight faced with a hard steel conical point was dropped from a known height on the specimen. The reciprocal of the width of the impression was taken to measure the hardness. The hardness of a ductile material may be defined as the ratio of the steady load to the spherical surface of a ball indentation, or the work required to indent a unit-volume, or, more generally and simply, the intensity of pressure on the area of the surface indented at which the material yields or flows in the conditions of a test.

The Personal Element in Management

By A. M. HECKMAN

Twenty years ago mining communities clustered around one to a dozen small mines, each one employing 20 to 200 men; they had a 10 and often a 12-hour day; they had no business; they had no recreation; the Y. M. C. A. was unknown; the men had to go to their homes dirty and wet, for there were no modern change-houses. One could mention a hundred advantages that the miners of today have over those of yesterday. Yet today, in spite of these advantages, there seems to be more discord and dissatisfaction.

What is the reason for this condition? Is it because the education of the miner is so much better and that he demands more civilized conditions? Is it due to the natural unrest, or what is it? It is noticeable that disorderly labor conditions are more frequent where large organizations dominate. Troubles are not as likely to occur where there are ten mines each employing 200 men as where there is one man running ten mines and employing 2000 men. This gives us a hint as to where the trouble lies. It is true that big organizations and large capital have made ore where no ore existed before; they have made possible the working of extremely low-grade deposits, but with all this have come labor problems, many of which are not solved by largeness of organization.

It might be interesting to see why the small organization could exist under conditions that would soon call for a strike in a large one. It was because 'Bill' was the boss, and he was 'Bill' to everyone. The men could go to him and talk as man to man, whether the subject was the weather or how to run the mine. 'Bill' knew their troubles, their complaints, their grievances; he knew their families and how they were getting along. He was undoubtedly a man of superior judgment, or he would not have been made the boss. His superior judgment allowed him to forsee what his men were going to want before the men themselves had given it a thought, and the result was that 'Bill' was more than their friend.

When the organization grew to 500 men, however, 'Bill' did not have so much time to loaf around with the men; he was confined to his office more and more; he had to delegate work to others, and right at this point 'Bill's' mine began to suffer in its relation to labor. The personal touch was lost and the feeling that they, the workmen, were actually having a part in the working of the mine was gone. Previous to that time the men all felt that they were an important part of the organization. The change was not sudden, but it came about through the fact that the gradual change in the personnel made the boss unfamiliar with the new men; in a comparatively short time he gave an order "Send a man to do this or that," whereas a short time before it would have been "Ask Tom Jones to do this or that."

The personal touch has given way to the military system. Everyone in the organization, while he does not know his place by military name, knows his rank well enough, and too often he is made to feel his inferiority. The military system has grown up as the one substitute that fits all conditions, and that does not fit itself around the personality of one man, to be lost or destroyed by the removal or death of that man. It has grown up because of the fact that men of the necessary calibre to fit the manager's chair and operate under the personal system of management are rare, and the further development of the military method is going to make such qualities obsolete, unless steps are taken to use them.

From the point of view of satisfaction, contentment, freedom from labor troubles, real efficiency, there is no question about the superiority of the personal system of management. Its drawbacks, however, are evident. First, the difficulty of finding a man endowed with the rare gifts necessary for this type of management, and second, undermining of the organization whenever that man is removed, unless he has been sufficiently farsighted to select and train a successor. The advantage of the military method is that the organization is not disturbed greatly by changes in the personnel.

The personal method, which makes the workman feel more like a human being and less of a commodity, requires in its manager long residence along with the growth of the organization. It requires a man of remarkable breadth and versatility, and of unusual memory. It requires a man who is not irritated by trifles, who can put the man talking to him perfectly at ease. He must know how to be a father without being paternal; he must have human sympathy. It is true that a man with such qualities is rare, but he is still rarer when it is considered that he must be a technical man and a technical engineer as well.

Outside small organizations, there are but few opportunities to witness the methods and the results of the personal system of management in this country, but at the coal mines of the Phelps Dodge Corporation at its Stag Canyon branch at Dawson, New Mexico, it may be seen applied to a community of 5000 people. Dawson produces about 5000 tons of coal per day, the greater part of which is converted into coke. It is a company-owned community having all the advantages of a company-owned community—cheap rent, free water, cheap light, good schools, etc., without the usual restricted competition. The reason for it is that the management sees things through the eyes of the workmen.

In population, Dawson is like any other coal-mining town; it has many nationalities and many languages, but it is only in the physical characteristics that it is the same. There is a feeling of contentment among the employees that is hard to find elsewhere and there is a loyalty and co-operation seldom seen where a large company dominates the community. The workmen feel that they are well represented by the manager and that their interests are considered. They know that the manager is seeing things through their eyes, and they have a trust and a confidence in his uprightness and judgment that is almost childlike.

Dawson has a good climate and enjoys excellent health; it is considered a good place to work and to live. All the good things one may say about Dawson as an example of industrial content do not come from big parks, children's playgrounds, visiting nurses, and the many other things that have been used all over the country to provide for the satisfaction of employees without the personal touch. Barrels of money may be spent in creating or attempting to create a mental condition of satisfaction, and while in some cases it does create such a feeling, it is usually mixed with a feeling of gratitude for the many things provided. It is not meant that Dawson has none of these things, for a close finger is kept on the pulse of the community, and when it is seen that certain things must be improved, they do not wait for a committee of the workmen to ask for it.

One may ask the formula for this apparently ideal labor condition. Its formula is simple in so far as the ingredients are concerned, but difficult as to the mixing and the application of the proper dose. The ingredients are absolute fairness and equality irrespective of nationality, class, or color, true sympathy and interest in small things, an equable disposition, and the ability to see things in the light of the workmen. The difficulty comes in mixing these ingredients into one person and the ability of that person to administer them.

The personal element in management, as has been said, is a lost art, lost through lack of development, but wherever tried, it has been successful. It has not been lost through lack of appreciation of its value; it has been lost in the excitement of a rapid building of organizations, becoming replaced by the simpler military system. The fact that it is being lost, however, is beginning to be appreciated, as is shown by the interest taken in the well-being of the individual rather than of the mass.

In many organizations throughout the country men are being selected to furnish this personal touch, and while these men are usually broad enough to shoulder the work, their task is hopeless unless the management develops the same characteristics. The attitude "don't bother me with your troubles: take them to the Welfare department" is too commonly the reason for the failure of that department to obtain results. Of course, a manager who is far-seeing enough to establish a personnel department is usually ready to back it up, but too frequently there is no clear understanding on his part as to what should be backed up. Personnel departments are successful, and are the next best thing to the direct personal touch. Cold business is losing its sway, for labor objects to being classed as a commodity. True co-operation will come when both sides admit that the other side has a point of view and a right to that point of view. This attitude can come only by friendliness and the personal touch.

CHEMISTRY of gold at high temperatures and pressures was discussed by H. H. Morris in the 'Journal of the American Chemical Society' recently. Gold is soluble in solutions of $AuCl_3$, acid with HCl, at the boiling temperature. AuCl is formed, which may be titrated with $KMnO_4$. From this pure gold hydroxide is obtained. When heated with water this yields metallic gold at 322°; small amounts of inorganic salts lower the decomposition temperature as much as 70°. Calcite heated with $AuCl_3$ becomes plated with gold above 310°. $Au(OH)_3$ is first formed and then reduced to metal. Magnesite may be similarly plated and the crystals are of a different habit from those formed on calcite. $AuCl_3$ may be heated under pressure of aqueous vapor as high as the critical temperature of water before the gold separates. If small amounts of NaCl, $MgCl_2$, or $CaCl_2$ are added, $AuCl_3$ is much more stable toward heat, only incipient reduction being obtained at 450 to 600°. In these solutions calcite and magnesite are only slightly plated at 500°. $CaHCO_3$ is without effect on the stability of $AuCl_3$ toward heat, but $MgHCO_3$ acts like the normal salt, causing the formation of $Au(OH)_3$ and gold at 322°.

ESTIMATION of sulphur in pyrite may be made accurately as follows, according to Z. Karaoglanov, P. Dimitrov, and M. Dimitrov, as given in the 'Journal of the American Chemical Society: After the sulphur has been oxidized to H_2SO_4 by heating with a mixture of HNO_3 and HCl, or by fusion with Na_2CO_3 and KNO_3, the H_2SO_4 may be precipitated directly from the HCl solution obtained after separating the silica, previous removal of the iron being unnecessary if the precipitation is made under the following conditions: Dilute to 700 cc. the solution from 0.5 gm. of pyrite, which should contain from 30 to 50 cc. of 6/N free HCl, heat to boiling, and gradually add 40 cc. of hot 10% $BaCl_2$ solution diluted previously with 100 cc. of hot water while the mixture is stirred. Collect the precipitated $BaSO_4$ after 15 hours, wash first with water containing HCl and $BaCl_2$, then with hot water, dry, ignite, and weigh.

TIN PRODUCTION of the Federated Malay States is responsible for 40% of the world's total. In 1917 these four States yielded 39,833 tons, a decrease of 4037 tons when compared with the output of 1916. There is a total of 55,576 hp. used in recovering this metal, which is reduced from the oxide state at Penang and Singapore. The power-plants consist of steam, 23,748; steam-electric, 2420; hydraulic, 18,524; hydro-electric, 4395; suction gas, 1794; oil engines, 2692; and oil-electric, 2003 horsepower.

HOUGHTON, MICHIGAN

Copper Output Estimates.—Men Returning From Munition Centres.

The total output of copper for this district in 1918 will not exceed 210,000,000 lb., judging by the present indications. This is 70% of normal. Generally speaking there never was a time in the history of the larger and more important copper producers here when the newer openings showed a better grade of ore and a better chance to make profits than at present. The one handicap is the lack of men. There is no expectation of a betterment in the labor situation until next spring.

Mass Consolidated and Victoria have raised wages in proportion to the advance made by other mines. Some of the men from the Mass who went to Seattle, Washington, attracted by the stories of high wages, are returning. Others contemplate coming back. The experience has been costly to them.

PLATTEVILLE, WISCONSIN

Zinc, Lead, and Pyrite Mining in September.

The draft, influenza, power changes, and an irregular ore market were responsible for September being a rather unsatisfactory month. The output is now only 60% normal. The reserve of concentrate carried over from August, conservatively estimated in excess of 10,000 tons, was reduced somewhat, but at the close of September there was at least 8000 tons of all grades in the field.

High-grade ore prices suffered as well as the lower grades, as business for the month gained impetus. Allocated zinc ore for sheet metal started off on the usual basis of $75 per ton, but the best price reported the first week was $71.25. Then it dropped to $70, advanced again to $73.25, and closed at a premium, going to $75.80, the best price received so far this year. Second grades acted similarly, opening at $51 to $52.50, dropping $3, and closing on fairly good grades at $55 per ton, basis 60% metal. The lower grades were in poor demand at the beginning, and little ore sold in open market. Toward the latter part of the month prices showed improvement, offerings of $23.50 being made for separator feed, on a basis of 30% zinc.

Lead-ore producers fared well throughout September, the price offered remaining exceptionally firm at $100 per ton, 80% metal content. Some unexpected competition developed, and the freer deliveries showed that much of the ore sold and delivered had been held long in reserve. Competent authorities have stated that there was no reserve lead ore here, so it appears that producers are fairly clever in making this appear so. The price at the end of September in some cases was close to $105. There is still another 1000 tons in the field for which producers expect not less than $110 per ton.

Shipments of pyrite were larger than those of former months, but only open-market sellers profited from its sale. Firms held under contract will be glad when these agreements terminate at an early date. Others have received 25c. per unit of sulphur per long ton.

Shipments of ores during September, from mines to separating plants in the field and from mines to smelters direct, totaled as follows: blende, 13,069 tons; lead, 984 tons; and pyrite, 2608 tons.

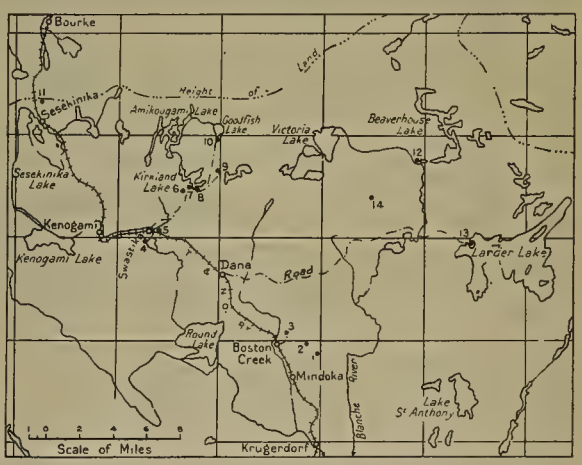
The Federal government established a labor agency at Benton, with T. M. Crowley in charge, in the heart of the zinc district, at which an effort is now being made to improve the labor situation as much as possible. The method employed is wrong. Competent miners have been taken in the draft at all points in the field until the industry is practically demoralized on this account, while zinc mining is regarded as an essential war indusry. It would not, in the estimation of patriotic citizens, be wrong for competent zinc-ore miners to claim exemption.

PORCUPINE, ONTARIO

Development in the Goldfields of Ontario.

Kirkland Lake.—Great activity prevails in this area. The Teck-Hughes mine, which has been closed for some months, is again being operated.

The decision of the English courts in litigation over the Tough-Oakes having put $150,000 into the company's treas-



PART OF ONTARIO, SHOWING POSITION OF THE KIRKLAND LAKE AND BOSTON CREEK GOLDFIELDS. THE NUMBERS ON THE MAP ARE THE FOLLOWING MINES, ACCORDING TO THE ONTARIO BUREAU OF MINES:

1.	Miller-Independence	6.	Kirkland Lake	11.	Smith-LaBine
2.	McRae	7.	Teck-Hughes	12.	Mine D'Or Huronia
3.	R. A. P.	8.	Lake Shore	13.	Goldfields, Ltd.
4.	Swastika	9.	Tough-Oakes	14.	Elstone-Dunkin
5.	Lucky Cross	10.	La Belle Kirkland		

ury, the mine is being unwatered and the mill cleaned-up for the resumption of operations.

The Ontario Kirkland, in which two veins of high-grade ore have been uncovered, has ordered an electrical equipment, and as soon as it is in place will sink a shaft.

At the Montreal Kirkland a shaft is down 50 ft., to be continued to the 100-ft. level.

The Wright Hargreaves will construct a 150-ton mill.

Rapid headway is being made in the development of the Burnside. One shaft is down 360 ft.; another is being sunk

on No. 6 vein, 750 ft. distant. A mill is to be built to treat 30 tons daily using amalgamation only.

Joseph Houston, formerly assistant manager of the Dome Mine, has been put in charge at the Kirkland-Porphyry, where the workings have reached a depth of 400 ft. The vein is 20 ft. wide in places, carrying high-grade ore.

The minority shareholders of the Orr Gold Mines, Ltd., from which the property was taken over by Kirkland-Porphyry, are dissatisfied with the arrangement, and litigation is threatened.

Boston Creek.—Important new discoveries have recently been made on the Rogers-Barnett group of claims, quartz stringers carrying free gold were found in a dike 40 ft. wide, apparently composed of altered basalt. This find, situated 8 miles south-east of the Miller Independence, considerably enlarges the known gold-bearing area, and many prospectors have staked claims in the neighborhood.

Another discovery on the Campbell claims shows high-grade gold ore associated with tellurides.

The O'Donald claims, staked in 1913, have been taken over under option by Robert W. Norrington and associates of Detroit, who agree to spend at least $1000 per month in development work.

Cobalt.—A new orebody has been found on the surface at the Buffalo, close to No. 5 shaft. The vein is 3 in. wide and carries several thousand ounces of silver per ton, with a good grade of milling ore on each side.

The Cobalt Provincial, closed for two months, will be reopened as soon as electric pumps have been installed. A flotation plant has been ordered.

Porcupine.—The Hollinger Consolidated is producing gold valued at upward of $500,000 per month, notwithstanding the shortage of labor and the inefficiency of many of those procurable. This will probably improve during the winter, when many out-door workers will seek employment at the mines. The mill is working only at about half capacity, but is understood to be making profits considerably ahead of dividend requirements, amounting to 1% (5c. per share) each eight weeks. Provided a full staff could be secured, the mill could be speeded up to between 3000 and 3500 tons per day.

At the Dome Mines, 60 men are carrying on operations, mainly on the 1250-ft. level, where a cross-cut is being driven toward the Dome Extension boundary. A contract has been let for driving a raise from the 800 to the 700-ft. level. The plan of development is understood to include opening levels at each 100 ft. down to the deepest working.

The new shaft being sunk at the Davidson, some distance north of the original workings, is down nearly 400 ft. Its object is to open a good orebody indicated by diamond-drilling at the 550 and 650-ft. levels, where it was 30 ft. wide and said to assay $24 per ton. In the old workings, an extensive body of good milling ore has been opened down to the 300-ft. level.

Important new discoveries are reported at the McIntyre, the best being an orebody averaging 15 ft. wide assaying $16 per ton, found in a winze put down 125 ft. from the 1000-ft. level.

YERINGTON, NEVADA

Operations of Bluestone M. & S., Nevada-Douglas, Empire-Nevada, Bluejay, Rockland, Silverado, and McConnell Companies.

The new flotation plant at the Bluestone mine is doing good work. Concentrate assaying 26% copper is shipped to Utah. In addition to the concentrate, 300 tons per day of oxide ore is sent to the Mason Valley smelter at Thompson. This smelter is not equipped for reduction of concentrate.

Nevada-Douglas is mining 100 tons daily from its mines at Ludwig and the western Nevada. A large amount of development is being done. On the 800-ft. level of the Ludwig, sulphide ore has been found. Some ore is also being extracted from the Casting Copper section. Many local people believe that this area will develop into the most valuable property owned by the company. The ore occurs as replacement deposits in limestone. A large tonnage has been mined in the past.

It is reported that a leaching-plant is to be erected at the Empire-Nevada. Sulphuric acid is to be used. Last winter, experimental work was done in a 20-ton plant in which ferric chloride was used. While the process was successful, further experiments showed that sulphuric acid was better adapted to the ore, which carries oxide and carbonate of copper. It contains little iron and is very silicious. The ore is found in an altered monzonite. In 1913 this ground was drilled by the General Development Co. A large tonnage of oxidized ore has been found, and the future of the property is considered excellent. J. E. Gelder is in charge.

E. J. Ross has made a number of shipments of oxide ore from the Bluejay mine east of Yerington. It occurs in irregular lenses in monzonite, near the surface.——Adjoining the Bluejay on the east is a property owned by L. W. Trankle and W. McDonald. A number of cars of 6 to 9% ore has been shipped from surface openings.

The Rockland mine in the Pinegrove district, south of Yerington, has suspended operations. This is the only gold mine in the district. Costs have increased so much that this was the only course. During the last 2½ years the mine yielded $350,000 of ore, and for a while made good profits. The ore is rebellious, but an extraction of 90%, with a loss of less than 1 lb. of cyanide per ton, was obtained. The vein has been explored for a length of 1500 ft., and the mine is said to be in better condition than at any time. In addition to the gold, the ore contains 2.5 oz. of silver, largely in arsenic and antimony minerals. The mill treated 45,000 tons, of which 6000 tons was old dumps and tailing. The average of the mine ore was $8.50, and the average silver obtained was 65c. The newer workings show some increase in the amount of silver. The capacity of the mill was 75 tons per day, but shortage of water limited this to 50 tons actually treated. A dewatering filter would solve the tonnage question, but the property never was properly financed and money could not be raised to put in the needed equipment. It is locally believed that if sufficient capital had been provided the mine would have paid good dividends, and if the mill were operated to capacity profitable operations would be easily possible. The management was good, and operating costs were low. The present equipment is excellent and complete.

The Silverado mine at Sweetwater is erecting a cyanide-plant. It is planned to crush the ore to 30-mesh by stamps and to leach it. The value is practically all in silver, in the form of argentite and chloride. An attempt was made to concentrate this on tables, but extraction was low on account of sliming. A considerable amount of high-grade ore has been shipped to smelter.

The McConnell Mines Co. continues to make small shipments of ore. This property is just south of the Mason Valley, and has the largest body of limestone, in which the ore is found, of any property in the district, except the Mason Valley. It is the general opinion that this can be developed into a large property, but the owners lack capital, and have contented themselves with extracting the easier minable orebodies near the surface.

Luning.—It is said that the Jumbo Copper Mountain company's property north-east of this place, shows enough ore to warrant erection of a large mill. A large quantity carries 8% copper. Tests have been satisfactory, but construction will probably be deferred. L. L. Dellinger is superintendent and J. K. Turner is consulting engineer.

ALASKA

Juneau.—Alaska Gastineau during September milled 47,850 tons of $1.247 ore. This is just half of the August tonnage, and 12 cents lower in value, due to storms and other troubles.

Kennecott.—Copper production of the Kenecott Corporation in August was 5,280,000 lb. In July the output was 5,090,000 lb., and in June 4,044,000 pounds.

Valdez.—At the Midas mine of the Granby Consolidated, near here, Boyles brothers, diamond-drill contractors, drilled 54 ft. in eight hours with a 22-hp. Ford gas engine attached to a U. G. Longyear machine. The ground varied in character, and eventually cut a good grade of copper ore. This is the largest footage drilled by a diamond-drill in Alaska in this time, by means of any power. Gus Reardon operated the machine.

ARIZONA

Ajo.—New Cornelia has more than 100 men working underground. Sulphide-ore shipments to Douglas have increased to six cars daily. A sixth solution storage-tank, and an addition to the fine crusher, are under construction. Preparatory work for the addition of another motor-generator set has been started.

Bisbee.—The shaft of the Denn-Arizona is being sunk to the 1800-ft. level.

Shattuck-Arizona produced 686,844 lb. of copper, 325,496 lb. of lead, 8621 oz. of silver, and 106 oz. of gold during September.

Douglas.—Copper production of the Phelps Dodge properties in September totaled 15,500,623 lb. This is about the same as in September of 1917, but 2,500,000 lb. below the average for 1918.

Jerome.—After a shut-down of over two years, sinking at the shaft of the Dundee-Arizona, which was down 500 ft., has been resumed. The tunnel of the United Verde Extension has drained the ground so that the shaft is dry, and no water is expected for some time.

The United Verde Extension has just completed erecting a second 250-ft. twin oil-balanced turbine-pump.

Miami.—The Miami Copper Co. produced 5,012,865 lb. of metal in September, well above the average for 1918.

Prescott.—The Phelps Dodge Corporation has re-opened the Snoozer property at Senator. A new hoist has been erected, development is under way, and several carloads of ore have been shipped to the smelter at Douglas.

Ray.—Copper output of Ray Consolidated in September was 7,250,000 lb., well up to the average.

Winkelman.—A rich silver-gold strike has been made eight miles north, near the old Christmas mine. A stamp-mill has been erected. A four-mile road to the mine is under construction.

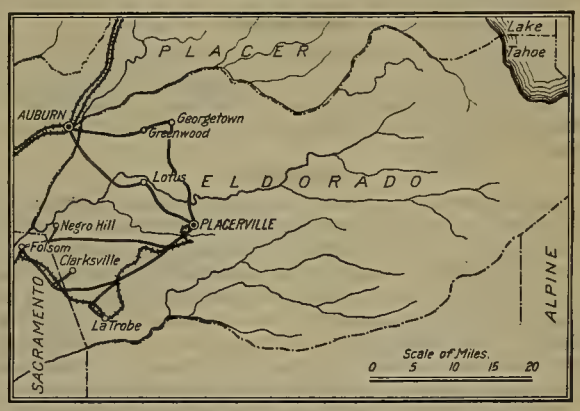
Yuma.—The Red Cloud mill in the Silver district has been destroyed by fire, the estimated loss being $100,000.

CALIFORNIA

Big Pine.—W. A. Sanger has applied to the State Water Commission for a permit to use ½ cu. ft. per second of the waters of Deer creek, Inyo county, for development of tungsten mines and for milling purposes. Water will be diverted by a dam 3 ft. high, 20 ft. long on top and 6 ft. long on bottom, and conveyed by pipe-lines 1¾ miles long. The estimated cost of proposed construction is $6000.

Bishop.—Gaylord Wilshire reports that development at the Wilshire Bishop Creek mine has been successful this summer. An 80-ton flotation plant, made by the K & K Co., is being erected, and is expected to be in operation by November 1, working through this winter. The K & K tests indicate a recovery of over 90%. The mine was shut-down in the fall of 1915 owing to low extraction by cyanidation, also on account of the lower grade of the ore. Development this summer on the 300-ft. level is stated to have opened a continuation of the main vein, showing a width of 22 ft., assaying $21 gold per ton. A drift has been driven 70 ft. on this new shoot with the face still in good ore. The drift is being continued.

Placerville.—The Greenwood and Georgetown districts at present are two of the principal regions producing chrome



ELDORADO COUNTY, CALIFORNIA, SHOWING SITUATION OF CHROME DEPOSITS.

ore in El Dorado county. The Negro Hill, Clarksville, and Latrobe districts, in the extreme west end of the county, are also large producers of the ore. The Shepard, Castillo, Federwitz, and Johnson leases are four of the big producers in the two first named districts. A. H. Simpson, of Placerville, general manager for the Union Chrome Co. of San Francisco, states that shipments of about one carload of 60 tons capacity per week are being made from the said four lease-rights. At the Johnson lease, 2½ miles east of Lotus, there is said to be over 50,000 tons of 30% chromite available, and good indications for a much greater tonnage. The ore is all hauled on big Moreland auto-trucks to the Placerville railroad station and loaded onto the S. P. cars. Johnson and Fitzlaaf have the contract of trucking the ore to Placerville, the railroad, mining, and financial centre of El Dorado county.

Grass Valley.—The North Star company has passed its quarterly dividend. The president, G. B. Agnew, states that

costs have risen steadily, and lately, owing to a shortage of labor, milling has been curtailed. All development has been stopped. Additional taxation has had its share in cost of operations. If the only question involved were that of profitable or non-profitable operation, it might be advisable to close the mine for the present; but various other considerations must be kept in view, such as the importance to the Government of the gold produced and the dependence of the town of Grass Valley on mining.

The company's cash resources will enable it to keep the mine in operation and good order, although no considerable profit can be expected under existing conditions. The directors look forward with confidence, on the strength of past developments, to a resumption of profitable operations and the payment of dividends after the termination of the War.

Keswick.—A Gibson mill is being erected at the Scottish Chief (Menzel) mine on Flat creek. It will be ready by mid-November.

Shawmut.—The Belmont-Shawmut Mining Co. has applied to the State Water Commission for a permit to use 1 cu. ft. per second of the waters of Woods creek, Tuolumne county, a tributary of the Tuolumne river, for mining purposes.

Sierra.—The Shamrock gold claims near here have been bonded by J. Mansfield to H. A. Hail and S. V. Hubbard for a large sum.

Yreka.—It is reported that a number of hydraulic mining companies in the Klamath and Salmon districts are preparing for early operations. Recent rains have replenished the water-supply. The rain has damaged roads, interfering with haulage of chrome.

COLORADO

Cripple Creek.—The Cresson company paid 10c. per share, $122,000, on October 10. The total is now $6,905,163.

The Portland company pays 2c. per share, equal to $60,000, on October 21. This makes $180,000 for 1918, and $11,257,080 to date.

GEORGIA

Cartersville.—Manganese ore in this district has been examined recently by Lawrence La Forge of the U. S. Geological Survey, J. P. D. Hull, assistant State geologist of Georgia, and W. R. Crane of the U. S. Bureau of Mines. The deposits are in a belt 1 to 3 miles wide and 18 miles long on the east side of Coosa valley, in the eastern part of Bartow county. The result of the investigation was encouraging. The area has been worked for many years, and estimates of reserves give at least 100,000 tons of high-grade ore and perhaps 250,000 to 300,000 tons of manganiferous-iron ore. Twenty mines are now operating. Recent shipments of 1600 tons averaged 42% Mn, 6% iron, 6% silica, and 0.14 to 0.20% phosphorus. Wages are $2.50 per day of 10 hours. The cost of ore on cars is $4 per ton. The monthly output is now 300 tons, but could easily be increased to 4000 tons.

IDAHO

Dividends paid by companies operating in this State during the third quarter of 1918 are as under:

*Hercules	$750,000
*Bunker Hill & Sullivan	490,500
Hecla	150,000
Caledonia	234,450
Tamarack & Custer	106,575
Federal	209,757
Richmond	8,400
Total	$1,949,682

*Estimated.

Kellogg.—In a drift from the bottom of the 275-ft. incline shaft of the Coeur d'Alene Antimony Co. high-grade stibnite was opened recently. The mill is reported to be making a good recovery by flotation. M. E. Jolley is president of the company.

Mullan.—Consolidated Interstate-Callahan pays 75c. per share, equal to $348,743, on October 21. This makes $813,733 for 1918, and $7,091,098 to date. C. W. Newton is general manager.

The Idaho-Carbonate Hill Consolidated M. Co. deepened its shaft 115 ft. in each month of August and September. It is to be sunk to 800 ft., having been started at 1200 ft. from the portal of the tunnel. The mine is well equipped. Twenty men are employed in charge of W. D. Greenough.

KANSAS

Baxter Springs.—The 300-ton mill of the Lucky Jenny Mining Co., four miles west, is ready for work. The plant is motor driven. It includes Rogers crushers, four sets of rolls, and three jigs. Sixteen holes drilled on the lease showed 3.6 to 19.9% blende, with some lead in places. The dump contains 25,000 tons of rich ore. Ira Turner is president.

Treece.—The new 400-ton mill of the Kansouri Mining Co. is nearly complete. Two shafts are in ore at 236 and 270 ft. depth.

MISSOURI

Joplin.—Production of the Tri-State fields last week totaled 7670 tons of blende, 271 tons of calamine, and 1756 tons of lead. These averaged $57, $39, and $100 per ton, respectively. The total value was $621,713, making $19,083,542 for 40 weeks. Missouri contributed $120,597 last week.

MONTANA

Butte.—Production of Butte & Superior in September was 32,000 tons of ore, yielding 9,500,00 lb. of zinc and 180,000 oz. of silver. The respective figures for August were 39,000 tons, 11,250,000 lb., and 220,000 oz. The I. W. W. troubles were the cause of the reduction.

North Butte pays 25c. per share on October 28. This makes $1 for the current year.

Wickes.—Regular shipments of silver-lead ore are being made to East Helena smelters from the Mt. Washington mine.

The Blue Bird copper mine is shipping ore to smelter.

NEVADA

Ely.—Nevada Consolidated yielded 6,670,415 lb. of copper in September, somewhat above the average output.

Goldfield.—Florence Goldfield has adjusted all claims against it, and the receiver, H. B. Clapp, has finished his work. Cash on hand is now $1872. Six lessees are working. The Florence went into the hands of the receiver November 23, 1916, since when the holdings in Goldfield have produced close to $250,000 gross, including the sale of from $25,000 to $30,000 of machinery, according to the 'Tribune'. The $2764 suit of the Western Ore Purchasing Co. against the receiver, arising from an alleged shipment of salted ore by a lessee, was dismissed by the Court. It is understood that this claim will be settled by agreement between the plaintiff and the Florence. Eight cars of ore are now in transit.

Gold Mountain.—The Tonopah Gold Zone is said to have found the extension of the Tonopah Divide vein on the 300-ft. level. The ore was cut 320 ft. north-west of the shaft. For 65 ft. assays yielded from $1 to $14 per ton. The shaft is to be sunk 200 ft. deeper.

The Tonopah Divide's new electric equipment is working smoothly. The shaft is to be sunk another 100 ft., making a total of 470 ft. The mine is to be thoroughly opened. From 100 to 200 tons of ore is to be sent weekly to the Gold-

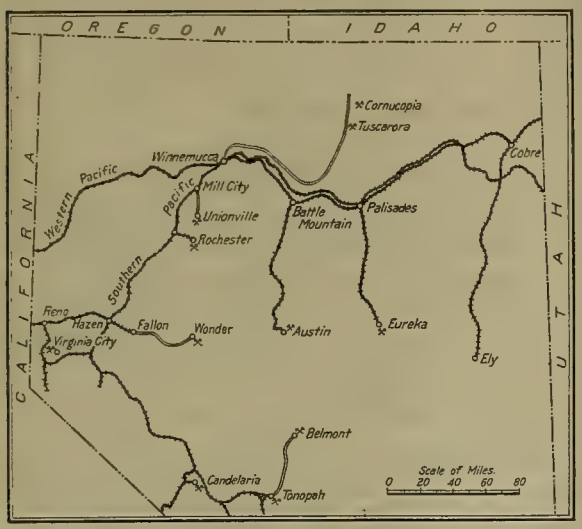
field Consolidated mill. This ore goes by team or auto-truck to the Klondyke station on the T. & G. line, where it is loaded on cars.

The Brougher Divide has done 300 ft. of work on its 300-ft. level, and will sink its shaft 200 ft. deeper.

Rochester.—In the 'Press' of October 12, a map showing the silver districts of Nevada unfortunately failed to show Rochester, the second of importance in this State. The accompanying new map has made good this deficiency.

The Rochester Mines Co. reports that at a depth of 100 ft., in block 4, high-grade ore has been found; also on the 250-ft. level under the above.

Tonopah.—The West End has connected the Ohio workings with No. 2 shaft, on the 800-ft. level, and is now tramming ore to No. 2 by an electric locomotive made at the mine. This will reduce haulage costs. The mill last week treated 983 tons of West End ore, 202 from lessees at the Montana, and 119 from the Rescue-Eula. The last mentioned has 5½ ft. of ore on its 1050-ft. level.



MAP SHOWING PRINCIPAL SILVER DISTRICTS OF NEVADA.

The Belmont continues deep exploration, results on the 1200, 1300, and 1400-ft. levels being very satisfactory.

The Extension is cutting a station at 1776 ft. New development last week amounted to 168 feet.

NEW MEXICO

Santa Rita.—Chino Copper Co. produced 7,936,000 lb. in September. This is a gain of 2,900,000 lb. over August, and the largest output since December of 1917.

OKLAHOMA

Bartlesville.—The three zinc smelters here are at full capacity, employing up to 1200 men. There are 12,896 retorts distilling metal, producing pure zinc, zinc oxide, and zinc dust.

Picher.—Production of the districts last week totaled 4838 tons of blende and 1345 tons of lead, valued at $409,076.

Quapaw.—The Bethlehem Zinc Co. has closed its mine and mill on account of labor shortage.

TEXAS

Terlingua.—The Mariposa Mining Co. has leased the quicksilver furnace of the Terlingua company. The plant, which has a daily capacity of 50 tons, is now in regular operation. The Mariposa company is also a buyer of custom cinnabar ore, and has purchased large quantities of lean ores from dumps. In one lot purchased recently there were 32,000 tons of ore, estimated to contain $241,000 worth of mercury. F. M. Dancy, of Philadelphia, Pennsylvania, is president.

UTAH

Bingham.—Utah Copper Co. produced 17,785,000 lb. in September, almost the same as in this month of 1917.

Salt Lake City.—The Vipont Mining Co., operating in the Ashbrook district of Boxelder county, contemplates erecting a 250-ton concentrating plant. C. A. Phillips of this city is president.

WASHINGTON

Leadpoint.—The new Riblet aerial tram at the Electric Point mine has been tested, and is in regular service. It will carry up to 300 tons daily if enough miners can be procured. Compared with the cost of hauling lead ore by wagon, there is expected to be a saving of $1.50 per ton.

CANADA

British Columbia

Anyox.—Granby Consolidated pays $2.50 per share, equal to $374,962, on November 1. This makes $1,499,848 for 1918, and $10,573,857 to date.

Coke is to be made here in a new plant being erected by Granby Consolidated. Owing to various delays, says 'Granby News', the works cannot be completed until next winter. The coal mined at the company's property at Cassidy, Vancouver island, is delivered at Anyox in barges. The unloading-dock has a high tower containing machinery for operating the buckets used in discharging. These buckets deliver onto an inclined belt-conveyor, which in turn delivers to a shuttle-conveyor situated on top of the coal storage-bin, and which distributes the coal as required. This bin contains 50 buckets, and has a capacity of 12,000 tons. The coal is next delivered through gates in the bottom of the bins to a horizontal conveyor and is carried to a two-stage bucket-elevator, the first stage depositing the coal into a crusher and the second into the bins over the ovens. This part of the work, with the exception of the two-stage elevator, is practically complete. There will be 30 ovens. They are 75% finished.

The tar from the gas is collected in mains and delivered to the tar storage-tank. A considerable part of this tar will be used as fuel in the power-plant, the boilers being equipped with suitable burners. The gas from the ovens passes through the coolers and purifying processes on to the scrubbers, then to the gas storage-tanks, when it is ready for distribution. A part of it will be used in the ovens for heating purposes, but a considerable surplus will be left that will be available for blast-furnaces, pre-heating furnaces, and forges, and may also be used for domestic purposes.

The buildings will be of fireproof construction, and at present the foundations are nearly complete. The power-house foundations are also in and this building will be rushed in order to install the boilers and machinery during the winter. The two Custodis brick chimneys are completed. A dam has been built at Carney lake, and a 16-in. pipe-line will be run from there to the power-plant for a water supply. This work is 60% completed.

Nelson.—In the Mines Report for 1917 the Eureka mine of the Nelson division is referred to as the chief copper producers. Improvements in equipment were under way that would permit the shipment of 50 tons daily some time in 1918. Recent news is to the effect that this work has been completed, and that the output can be increased to this tonnage. A lease has been taken on the power-plant of the Kootenay Gold Mines, and an air pipe-line 6000 ft. long has been put down. Machine-drills have been installed, thus doing away with hand-drilling. Other work done in-

cludes repairing of the tramway and wagon-road, and timbering of the mine. The Eureka has shipped 5000 tons of ore, has 9000 tons blocked out, and it is considered that the prospects of developing a large tonnage are excellent. The ore averages $15 per ton in silver and copper. The Inland Mining Co., with headquarters at Walla Walla, Washington, has taken over this mine from the original Eureka company.

Revelstoke.—Some rich copper ore has been opened on a new property in Arrowhead Lake district, near Revelstoke. The claims are near water transportation.

Trail.—The Consolidated M. & S. Co.'s plant received a total of 6155 tons of ore during the last 9 days of September, as follows:

Mine	Tons
Bluebell, Riondel, B. C	98
Center Star, Rossland, B. C	1406
Cork Province, Zwicky, B. C	45
Couverapee, Field, B. C	120
Emerald, Salmo, B. C	131
Electric Point, Leadpoint, Washington	176
Florence, Princess creek, B. C	45
Iron Mask, Kamloops, B. C	49
Josie, Rossland, B. C	819
Lucky Jim, Kaslo, B. C	50
Molly Gibson, Kitto Landing, B. C	106
Mandy, Le Pas, Manitoba	402
Mountain Chief, Renator, B. C	114
North Star, Kimberley, B. C	159
Paradise, Athalmer, B. C	110
Queen Bess, Sandon, B. C	151
Reardon, Clines, B. C	67
Silversmith, Sandon, B. C	49

Sullivan (zinc), Kimberley, B. C	1707
Sullivan (lead), Kimberley, B. C	217
Van Roi, Silverton, B. C	92

Ontario

Kirkland Lake.—The Teck-Hughes mine, closed for some months, is said to have been re-opened. If enough men can be procured the 80-ton mill will resume ore treatment.

Matachewan.—After working for 400 days in this new goldfield, the Nipissing company of Cobalt has withdrawn.

Porcupine.—Hollinger Consolidated paid a dividend of 1% (5 cents) on October 7. This amounts to $246,000, making $738,000 for 1918, and $8,772,000 to date.

The Hollinger company's mill is treating between 1400 and 1500 tons of ore daily, averaging around $12 per ton.

The Dome Mines has let a contract for raising between the 700 and 800-ft. levels.

The Dome Mines company, with sixty men, is developing on the 1250-ft. level, driving toward the east.

MEXICO

Hidalgo

Pachuca.—Santa Gertrudis, during the quarter ended June 30, made an operating profit of $384,000. The mill treated 69,114 tons of ore, yielding bullion worth $1,040,000. Underground work consisted of 319 ft. in ore, 579 ft. in unprofitable ore, and 839 ft. in rock. The plant worked at 70% capacity; the further reduction was made to conform to a modified and more efficient treatment system. With the arrival of more filter equipment, due within the next quarter, the tonnage will be increased. Aluminum dust is being used in place of zinc-dust for precipitating silver and gold from solution; considerable saving is already assured by this change, which is still under trial. During the period, an examination of the Bordo mines in this district was completed and arrangements made to work them under a 20-year lease. The equipment and further development of these properties is in hand.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

W. L. Gazzam, of Portland, was here last week.

J. P. Crowder has joined the Army and is at Camp Cody, New Mexico.

J. Nelson Nevius was in San Francisco on his way from Los Angeles to Nevada.

William Thomlinson has become secretary to the Vancouver Chamber of Mines.

Robert Chartran, engineer to the Lena Goldfields, in Siberia, is at the Argonaut hotel.

Gerald Sherman of Bisbee, Arizona, is on a visit to **Arthur D. Foote** of Grass Valley, California.

P. A. Robbins, manager for the Hollinger Consolidated Gold Mines, has joined the U. S. Army.

L. S. Cates, general manager for Ray Consolidated Copper Co., was in San Francisco during the past week.

Benjamin F. Tibby passed through San Francisco on his return to Salt Lake City from Downieville, California.

M. E. Cassidy, of Bisbee, has received a commission as Captain in the Army and is now at Camp Cody, Wyoming.

Arthur Notman, assistant superintendent for the Copper Queen Consolidated, has joined the Engineer Corps of the Army.

D. C. Jackling has been elected president of the Butte & Superior Mining Co., in succession to the late N. Bruce MacKelvie.

H. D. McCaskey, of the U. S. Geological Survey, was here last week conferring with Charles G. Yale, and is now at Denver.

George H. Garrey, who has been ill for the past three or four weeks, is able to be around again. He is at the Palace hotel.

F. G. Lasier, of Detroit, has received a commission as Captain in the Engineer Corps and been ordered to Camp Humphreys, Virginia.

A. L. Dowdell, formerly superintendent of the cyanide plant at the Empire mine, Grass Valley, is now in France with the Signal Corps.

Rudolf Gahl, formerly at Miami, Arizona, has opened an office as consulting metallurgist in the First National Bank Bdg., Denver, Colorado.

C. W. Purington sailed on the 'Tenu Maru' from San Francisco on October 15 on his way to Siberia, by way of Yokohama and Vladivostok.

Roy H. Allen, mining engineer and manager for the Tennessee Mining Co., at Joplin, Missouri, has been appointed Captain in the Quartermaster Department of the Aviation Service.

Harry J. Wolf, professor of mining in the Colorado School of Mines, has an article on 'Common Methods of Determining Latitude and Azimuth Useful to Engineers and Surveyors,' in the current issue of the 'Quarterly.'

E. K. Soper, professor of economic geology and dean of the Oregon State School of Mines, has returned to Corvallis, Oregon, after three months spent in geological work in the Atlantic Coast and Great Lakes regions.

THE METAL MARKET

METAL PRICES

San Francisco, October 15

Aluminum-dust, large and small lots, cents per lb	65—70
Antimony (wholesale), cents per pound	15
Copper, electrolytic, cents per pound, in carload lots	26.00
Copper, electrolytic, cents per pound, in small quantities	27.35
Lead, pig, cents per pound	8.30—8.80
Platinum, Government price, per ounce	$105
Quicksilver, per flask of 75 lb	$120
Spelter, cents per pound	12
Zinc-dust, cents per pound	15

ORE PRICES

October 15

Antimony, 45% metal, f.o.b. California, per unit	$1.10
Chrome, no definite quotations available.	
Fluorspar, 85% CaF_2, f.o.b. shipping point, or San Francisco, per ton	$22—$30
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.80—$1.30
Manganese, domestic, 35 to 45%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 90% Mo_2S	$1.25
Pyrite, per unit of sulphur, cents	28—32
Tungsten, 60% WO_3, per unit	$20—$25

EASTERN METAL MARKET

(By wire from New York)

October 15.—Copper is unchanged. Lead is scarce and firm. Spelter is quiet though steady.

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government has fixed its maximum at 48.81 pence for metal 925 fine.

A cable from Peking on October 8 stated that diplomats of the Allies, with the exception of the Japanese, have approved China's application for an embargo on the export of silver. The Chinese officials are formulating the conditions, which will be forwarded to the foreign banks at Shanghai for their consideration.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.35c., respectively, until August 15. On August 7 the current rates were again fixed until November 1, prices to be effective on the day of shipment, not the day of sale.

Concentrate, matte, or blister from Canada, Cuba, Mexico, and South America may now be imported containing only 50% copper. The former ruling of the War Trade Board was 60%.

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. This is to be continued until January 1, 1919, the price at point of delivery to be at East St. Louis plus freight. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefor $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds.

TIN

Prices in New York, in cents per pound. The monthly averages in 1918 are nominal. Under the new international agreement, the United States is to get 66% of the world's supply of tin.

ORES

Antimony: There have been no developments in the market here.

Manganese alloys: There have been fairly large sales of spiegeleisen, totaling about 6000 tons for delivery this and next year. The quotation is firm at $75, furnace, for 16% alloy, and $82 for 18%. Ferro-manganese is still easy at $250 delivered for 70% alloy plus or minus $3.50 per unit above or below this standard. The spiegeleisen output of American furnaces in September will be the largest ever recorded. Uncompleted returns indicate an output for the month of over 37,000 tons, with the production of ferro-manganese at close to 26,000 tons.

Molybdenum: The market is nominal at about $1.25 per lb. of MoS_2 in 90% material.

Tungsten: No further news of a definite nature has come out regarding the inter-Allied pooling of tungsten resources. A fair business continues to be done at the prevailing prices of $19 to $25.50 per unit in 60% concentrate, depending on the quality of ore. Ferro-tungsten is unchanged at $2.40 to $2.50 per lb. of contained tungsten. Exports continue large.

Eastern Metal Market

New York, October 9.

Comparative dullness pervades all the markets and open demand is very light.

Copper output is reported as having improved to some extent. Interest centres in the price to be effective after November 1.

Indications point to the putting into effect of international control of tin. There is no buying.

Lead is as scarce and light as ever, and is under very strong control.

Zinc continues to fall, with demand exceedingly light.

Antimony is fairly steady.

Pig-iron production in September was at the rate of 113,942 tons per day, the highest rate in the history of the industry, representing a gain of 4600 tons per day over that of August. The September total was 3,418,270 tons, or 113,942 tons per day, against 3,389,585 tons in August, or 109,341 tons per day; yet fourteen furnaces blew out last month and seven blew in, making a net loss of seven. The total in blast October 1 was 365. September production was at the rate of more than 41,500,000 tons per year, against less than 40,000,000 tons per year as the August rate, while the official figures for the first half of the year were only 18,227,730 tons. The fact that October, with its 31 days and its generally favorable weather is always set apart for record-breaking, points to a continuance of the good work of last month. The Steel Corporation's report for the past week shows 92.7% of blast-furnace capacity and 100% of ingot-capacity in operation, against 92 and 97.8% respectively in the preceding week. A further statement from the Steel Corporation concerning the eight-hour basic day shows that the rate of pay for Sundays and holidays will be the same as for other days. In blast-furnace labor, where each man gets one day off in seven, it will be the policy to pay straight rates for eight-hours' work on Sunday and time and a half for the additional hours.

Orders from the Allies have materially increased, and some re-arrangement of priorities may be necessary in view of the more acute situation developed this week. A large northern Ohio shell-forging plant was closed for three days for lack of steel, and is now working at only two-thirds capacity.

COPPER

With most consumers covered until November 1 there has been in the last few weeks little other buying. In a regulated market, such as this, those using copper for war-work know they can secure what they need when they require it, and there is no need of competitive buying. There have been some sales for delivery after November 1, but at the fixed price which may rule at that time. A decision as to what price shall rule after the present 26c. per lb. expires by limitation November 1 will probably be decided between October 15 and 20. Those who have apparently devoted considerable thought to the question argue that there is no reason for any advance or any decrease. They say that there has been an increased output of crude and refined copper as well as larger importations of crude copper and lesser exports of refined thus far this year. Against this is cited the assertion that refining costs have gone up as well as a 10% advance in wages during September, made by the refiners. It is contended that the available supply of copper is about equal to our own needs and to those of our Allies. The price which jobbers are allowed to charge is 27.35c. per pound.

TIN

News regarding the international situation is only by inference, as no definite official information, or other reliable kind, is available. Conditions point to international control and to an elimination of importers in this country, although these still know nothing about their future. A significant fact is that in the last week there have been no offerings of Straits or English tin. Were the market free it is likelly there would have been some offerings. Another straw which may indicate which way the wind is blowing is a daily press statement last week that licenses for shipment of such tin were being issued only to the United States Steel Corporation. There is no assurance that these statements are true, and future developments must therefore be awaited. In the meantime consumers are remaining out of the market. Chinese and Banca tin, when offered at all, are still at high prices, and there is no indication that these producers will join the international agreement. The prompt market for Straits tin continues nominal at 82c. per lb., New York. Tin arrivals for September were high, as announced by the New York Metal Exchange. The total was 5454 tons, of which 3989 tons came in at Pacific ports. The amount in stocks and landing on September 30 was 275 tons. The monthly deliveries have grown steadily since 1913. In that year they were 3658 tons per month; in 1917 they were 4823 tons per month and, to October this year, they have been 5298 tons per month. To October 1, 1918, the total imports have been 47,428 tons as compared with 44,837 tons to October 1, 1917.

LEAD

The agreed prices on lead continue at 7.75c., St. Louis, or 8.05c., New York, for carload and larger lots, and there is no present prospect of these being changed for some time. All available supplies are being allocated, according to war needs, by the Lead Producers' Committee, which is doing this satisfactorily. There is little demand outside of that having to do with the War. The crux of the situation is output, and if this can be maintained at the maximum by the refineries, it is felt that these essential needs can be met.

ZINC

Some felt a week ago that the market would ease no further, but they have been disappointed. Quotations have fallen a few points almost daily. Yesterday prime Western was quoted at 8.80c., St. Louis, or 9.15c., New York, for October delivery, with spot-metal at about 8.90c., St. Louis, or 9.25c., New York. For November or December the quotation was about 8.75c., St. Louis, or 9.10c., New York. These prices were largely nominal, as the demand is exceedingly light and the market has not been tested. Nor are producers forcing their product. Grade A zinc is officially held at a maximum of 12c. per lb. base.

Sheet zinc has a maximum Government price of 15c. per lb. with plate zinc at 14c. per pound.

ANTIMONY

There is little change; the quotation is still 14c. per lb., New York, duty paid, for large lots for early shipment, but this could apparently be shaded under certain conditions.

ALUMINUM

Government fixed maximum prices control the market for No. 1 virgin metal, 98 to 99% pure and for scrap at 33c. per lb. for 50-ton lots, at 33.10c. per lb. for 15 to 50-ton lots, and at 33.20c. per lb. for 1 to 15-ton lots.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

RE-MANUFACTURING USED PIPE

In the iron and steel industries there is an acute shortage of raw material and a necessity for salvaging every available pound of scrap-iron or steel. Not only does this apply to the iron and steel foundries but to the concerns compelled to use iron or steel pipe in construction work. It has been found that used pipe may be re-manufactured and brought to a point where it may fulfil the requirements of engineering specifications. The Pacific Pipe Co., shortly after the San Francisco disaster, conceived the idea that old pipe could be salvaged and re-constructed to a point where it would serve in place of new material. They commenced operations at the corner of Main and Howard streets, where they installed considerable machinery. These machines consisted of devices for re-threading, steam-testing, cutting and welding, re-dipping, and straightening.

The company had entered into a business of which there was no other of its kind in the western part of this country. The sale of their product increased so rapidly that it became necessary to acquire in addition to the Howard street plant, the major portion of a block of land at the corner of Main and Bryant streets. Here they erected a building comprising about 10,000 sq. ft. of ground area and installed the best machinery possible to obtain, including the largest pipe-threading machine west of the Mississippi river. The company has a spur-track so that it can load at its own doors.

In re-manufacturing its pipe the Pacific Pipe Co. tests every foot to 120 lb. steam pressure, and every weakness is welded or remedied, as the case may require. The bends and crooks are straightened and all defects obliterated.

The market for the product of this company extends over the entire Pacific Coast as far east as Utah, and in the last two years a large trade with the countries westward across the Pacific has developed. Their customers are among the large light and power companies, irrigation enterprises, water companies, oil and mining companies, and all who have used pipe in large quantities. The Winter Garden Skating Pavilion, which gained prominence throughout the West while it was in operation in San Francisco, was equipped with a refrigerator-system comprising over ten miles of 2-in. pipe, so laid that there was not a threaded joint in its entire length, and this equipment was furnished by the Pacific Pipe Co. D. L. Breslauer, the sales manager of this industry, claims that the advantage of used pipe over new pipe is that the former may be had at a greatly reduced price, and that orders may be filled to cover all requirements of new pipe.

PORTABLE MOTOR-DRIVEN COMPRESSOR FOR MINES

The small portable compressor manufactured by the Ingersoll-Rand Co. for mine service, is most valuable, either as an auxiliary to the main compressed-air system, or for development work in mines without compressed-air service. It may be used for operating drills, coal-cutters, air-lifts, and for other purposes. It is mounted on a truck with flanged wheels of a gauge to suit the mine-track, so as to be

moved wherever needed. This type of compressor is made in capacities up to 415 cu. ft. of air per minute and for pressures up to 100 lb. The motor, which is built by the Westinghouse Electric & Mfg. Co., is designed to operate on any available current, and is furnished in sizes ranging from 12 to 56 hp., depending on the capacity of the compressor. A large air-receiver forms a part of the equipment. Into this the air is pumped and the pressure automatically is maintained constant.

SULLIVAN ROTATORS

The Sullivan rotators, 'DP-33' and 'DR-33', made by the Sullivan Machinery Co., may fairly claim to be an all around rock-drilling machine. Since its introduction, a few years ago, as an improved type of hammer-drill, its use has rapidly extended to nearly all kinds of rock-drilling, including block-holing and cutting hitches; shaft-sinking, and a great variety of down-hole drilling, driving, stoping, and even light tunneling; work in hard and soft rock, ore and coal, in quarries and mines, in road grading, in sewer trenches, and in heavy open-cut work. The rotator is a one-man hammer-drill in the fullest sense, weighing 40 lb. It is equipped with automatic steel rotation, is built in separate air and steam types, and may be used as a hand-tool or on a mounting. Rotators drill holes from eight to twelve feet deep, for 1¼-in. powder, and are available in several models, to suit varying conditions.

The standard machine for down-hole drilling is the hollow piston rotator. A jet of live air is discharged through the hole running from end to end of the piston, into the hollow steel, and thus to the bottom of the drill-hole, where it ejects the dust and cuttings, affording a clean rock-surface for the bit to strike. When no difficulty is encountered in cleaning the hole of sludge, as in shallow drilling or in very hard rock, the solid-piston rotator is recommended. For down-holes in damp or sticky ground, the air-tube rotator is superior, as its constant jet of live air, by-passed from the throttle to the rear end of a tube running through the piston and into the drill-steel, serves to clean the hole more effectively than the air-jet of the hollow-piston type.

The steam-tube rotator is similar in design to the air-tube drill, but uses steam instead of air. Its use is not recommended for holes deeper than four or five feet. It is a valuable adjunct to a steam-shovel, for block-holing rock fragments too large for the shovel to handle.

For soft loose or broken rock and for ore or coal, the Sullivan auger rotator is desirable. Its spiral drill-steel acts as a conveyor to keep the hole free from cuttings. With the exception of the steam-drill, any of these rotators may be used on a mounting. For driving and stoping, however, the Sullivan water-tube rotator is recommended. Its combined air and water-jet acts as an effective hole-cleaning device and greatly enhances the speed of drilling holes directed at or near the horizontal.

Students of drilling economics have emphasized the amount of time lost in a shift due to delays for moving mountings, changing drill steel, aligning the steel with the drill and following the hole. The 'Pnufeed' Sullivan mounting affords a means for speeding up the rock-drilling process by eliminating some of these causes of delay and minimizing others, to the end that a far larger proportion of the shift is made available for actually cutting rock. Equipped with this mounting, the rotator becomes almost an automatic rock-drill, suitable for light driving, slicing, or even stoping. It is the lightest driving-drill of its capacity on the market, and requires minimum labor both in operation and in setting up or tearing down. The 'Pnufeed' consists of a feed-cylinder and a piston which carries at its outer end an arm set at right angles, containing a seat in which the rotator is gripped by three clamp-bolts. To fit the rotator for this purpose the throttle valve is removed and the air is admitted to the drill and feed-cylinder by one throttle, placed in the short arm on the piston. The feed cylinder is held by a hinged clamp mounted on a trunnion, which fits a standard saddle, for support on a column arm. When the drift has been drilled up, the clamp-bolts may be loosened, the drill removed, the throttle replaced, when the tool is ready again for use as a hand-feed machine. The 'Pnufeed' rotator may also be used for overhead stoping by removing the feed-cylinder from the arm-clamp and resting its rear end on the ground or against an abutment. While any rotator, except the air-tube and steam-tube patterns, may be used on this mounting, the water-tube drill is recommended, on account of its combined water and air-jet, which secure the best results for cleaning holes in driving work.

CLEAN YOUR SMOKE-STACK

Where there are large smoke or kiln-stacks that become clogged with soot, it is necessary, in order to maintain draft, that they be cleaned frequently. A simple, economical, and efficient method for doing this is to shoot the stack with the 'stack gun' and FFF blasting-powder. This gun can be used in cleaning either lined or unlined stacks, brick or steel, without fear of injury. The gun can be made of an old piece of shafting about 4 in. diameter and 14 to 16 in. long; bore a hole 1¾ in. diameter and 10 in. long in the centre of the piece. Then bore a small horizontal hole ¼ in. diameter through the piece to the bottom of the centre-bore. This serves as a touch-hole for inserting the fuse. It can be mounted on a pedestal about 6 in, diameter so that it will stand upright. The method of operation is as follows. Pour some FFF blasting-powder into the mouth of the cannon to about 2 in. from the top. Tamp to the collar with dry clay. A short piece of fuse is inserted in the touch-hole and in contact with the main powder-charge. Open the flue-door at the bottom of the stack, set the cannon on the bottom, in the centre of the stack, light the fuse, and close the flue-door. The explosion shakes and loosens the soot adhering to the sides, causing it to fall to the bottom. It can then be removed through the flue-opening. A charge of 8 in. of FFF powder, 1¾ in. diameter, is sufficient for a stack 100 ft. high and 4 ft. diameter, or more. The number of shots necessary to thoroughly clean a stack depends upon its condition. Ordinarily three or four will clean a stack, but, if very dirty, it may require more. The size of the charge and length of the cannon can be regulated to suit the height and diameter of the stack.

'Ideal Power' for September tells the story of the reorganization of the Chicago Pneumatic Tool Co., giving the full list of all officials and their portraits, together with those of leading stockholders. Heading the list of large shareholders is Charles M. Schwab, followed by John R. McGinley, chairman of the board; H. A. Jackson, president; W. P. Pressinger, vice-president in charge of sales; W. H. Callan, vice-president in charge of plants; Jacob L. Price, vice-president and treasurer; H. D. Megany, assistant to the president; and J. U. Blanchet, comptroller. The magazine section is timely and interesting. Copies may be obtained gratis from the Chicago Pneumatic Tool Company.

The Merrill Metallurgical Co., 121 Second street, San Francisco, has just issued an interesting and attractive illustrated catalogue describing the Merrill precipitation process, the Crowe vacuum-precipitation process, and 'Merrillite,' which is an effective precipitant.

The Shoshone Sulphur Co., Dover, Delaware, has been incorporated with a capital of $2,500,000 to operate sulphur properties. Charles D. Allee and Harry McDaniel, Dover, are the principal incorporators.

Don't Blame the Lining---

It's the SHAPE of your ball-mill that tells the length of a liner's usefulness and the size of your scrap-heap.

If you are using an expensive all-steel lining you are wasting money. In any of the types of large diameter mills except the *Hardinge*, the hardest liners last only five to nine months at the best. In the

HARDINGE CONICAL MILL

a light-weight, special iron lining is used—more economical in cost and in freight charges, wearing longer, and lowering the cost per ton output.

THE REASON LIES IN THE CONE

which assures a continuous action of balls grinding against *pulp* but never against the *lining* or themselves.

Our nearest office will tell you more upon request.

NOTES 547

VIVE LA BELGIQUE 548

Congratulations to the King of the Belgians, to his gallant army, and to the people of Belgium on their approaching deliverance. King Albert as a constitutional monarch and a liberal exponent of the imperial idea. M. & S. P., October 26, 1918.

INFLATION AND CREDITS 549

An analysis of the meaning of inflation. The readjustment of values, the enlargement of credits, and the sustaining of prices after the War. The need for gold to correct the reaction from inflation. M. & S. P., October 26, 1918.

PLATINUM 550

The supposed discovery of a new catalyzer. The surrender of platinum jewelry. The demand and the supply of this metal. A criticism of the policy of the War Industries Board. M. & S. P., October 26, 1918.

ARTICLES

THE UTAH COPPER ENTERPRISE—IV. THE MINE

By T. A. Rickard 551

Continuation of a description of the big mine at Bingham. The mixture of races. Use of coal instead of electricity. The Lopez affair, a frontier melodrama. Upper Bingham and its un-Americanized elements. The need for educating and assimilating aliens. M. & S. P., October 26, 1918.

THE ZEEBRUGGE AFFAIR 556

A vivid account of the successful effort to block the entrance to the port of Zeebrugge, by an officer taking part in the expedition. M. & S. P., October 26, 1918.

DETERMINATION OF CHROMIC OXIDE IN CHROMITE

By W. C. Riddell and Esther Kittredge 558

A method developed for the rapid determination of chromic oxide in ores and concentrates, the result of analyses made for the War Minerals Investigation conducted by the U. S. Bureau of Mines. M. & S. P., October 26, 1918.

PATENTS 559

M. & S. P., October 26, 1918.

POTASH AND BLAST-FURNACE GAS 559

M. & S. P., October 26, 1918.

NEED OF MORE GOLD 560

Excerpt from 'The Americas', of the National City Bank. A discussion of the cost of mining gold in relation to the currency problem. M. & S. P., October 26, 1918.

REVIEW OF THE GOLD PROBLEM

By H. N. Lawrie 561

A compilation of statistical and economic data. Imports and exports of gold. Gold production of the world. The output of the U. S., showing distribution of productivity among States. Influence of the War on cost of production. M. & S. P., October 26, 1918.

FEDERAL TAXATION AND FINANCE OF MINES

By J. F. Callbreath 567

A statement from the Secretary of the American Mining Congress to the Committee on Finance of the U. S. Senate. The meaning of 'invested capital.' The War Minerals Bill. Decrease in the domestic production of gold. M. & S. P., October 26, 1918.

Electricity and Victory

Here are some of the ways in which modern industry has been speeded up by putting electric power to work in the right place.

Metal mines have boosted output to meet world-wide demands. Great central power plants in place of small local plants in coal mining areas now supply cheaper electric power per ton output for each mine. All tonnage records have been smashed in the steel industry. More and better cloth has been produced at lower power costs.

The engineering problems solved in putting electric power to work in these and other industries were many and intricate. Production of electrical equipment suited to this work and in quantities required is an important part of this company's service to American industries.

G-E engineers, located throughout the country, with the company's plants behind them, are also energetically engaged with the electrification of other expanded industries—food, textiles, coal, oil, chemicals, mines, metals, ships, aeroplanes, automobiles, munitions, central power plants, lighting and transportation systems—all essential to victory.

43-78

GENERAL ELECTRIC COMPANY

EDITORIAL

GERMANY'S latest note, signed by the same Secretary of State, is bewildering in its sophistry and prevarication. It protests against the reproach of inhumane actions at the moment when the people of Lille, Douai, and Roubaix are complaining loudly of the brutality to which they have been subjected up to the last minute of the German occupation of these cities; it denies the sinking of life-boats carrying passengers from vessels sunk by submarines at a time when the screams of the unhappy victims from the 'Ticonderoga' and 'Leinster' are still echoing around the world; it talks of such a change in the constutition of Germany as to ensure popular representation "based on equal, universal, secret, and direct franchise," yet we have no evidence that there has been either a revolution or a general election in the Kaiser's domain, and without one or both of these no such change is possible. The same Secretary of State, appointed by the Kaiser himself, is conducting this sparring for time, while the Germans are making an effective retreat to prepared positions in their rear. The advance of the Allied armies has been rapid, but there is nothing to indicate that the German armies are routed; on the contrary, they are moving backward without incurring heavy loss, they are not being destroyed, and if an armistice be granted they will remain formidable instruments for evil. The prisoners captured during the last ten days have been relatively few; so also the guns that the Enemy has lost; he is making a successful retreat, withdrawing rapidly over Belgium while pivoting firmly in the Ardennes, where our boys are fighting splendidly. He talks of 'honor' when he means 'advantage'; he is an outlaw not to be trusted; the less said to him the better; he invoked the arbitrament of force, and understands no other argument.

CONDITIONS in Mexico are reported to be improving steadily. The Mexican is an agile climber of fences and is becoming more amiable to Americans sojourning in his country now that the United States has developed imposing military resources. German propagandists are losing ground and are causing less trouble to American enterprise.

LAST year there was a plan afoot to organize a corps of American engineers to go to France for the purpose of assisting in the rehabilitation of the coal mines near Lens, Douai, and Cambrai; but the subsequent setback in the Allied offensive halted further action. Now the Germans are being driven from this coalfield and an effort is sure to be made to re-open the pits as quickly as possible. Unfortunately in the interval the Germans have done a great deal of damage not only to the equipment but to the mines themselves. A dispatch appearing in the daily press mentions five years as the time needed to render these mines productive again, but with intensive effort and co-operation it should not take so long. The Valenciennes coalfield, of which the Marles, Lens, and Douai districts constitute the south-western end, covers three-quarters of the coal resources of France.

IN a recent issue we referred to the fact that the 'featuring' of the Australian and Canadian performances at the front had misled many people and given material for pro-German propaganda in this country, and we imputed it to the British admiration for the loyalty and courage of their brethren from across the seas. A British officer informed us this week that there was another reason for the frequent mention of the Colonial troops, namely, that if British regiments were mentioned specifically the information was useful to the Enemy, whereas the mention in general terms of 'Australians' or 'Canadians' did not convey intelligence to the other side. Thus, if in an engagement, the West Kents and the Buffs happened to be engaged and were supported splendidly by a regiment of Canadians, it was more expedient to talk about the latter than to refer to the two English regiments, for that would enable the German command to identify the division, giving valuable information, such as is sought usually by means of trench-raids, leading to the capture of units and identification of their division to which they belong. Mr. Hearst, please copy.

AT a meeting of a large number of the producers of chrome ore, held in San Francisco last week, a permanent protective organization was formed, under the name of the Pacific Coast Chrome Producers Association. This is an excellent step. Through this organization the excited protestation of individuals who have been induced to enter into an industry that has entailed loss and discouragement will be replaced by such a temperate presentation of the circumstances as must command

respect at Washington. The producers of chrome have a real grievance, and it is of a kind that wins public sympathy. Before the War there was no interest in chrome mining in this country, because large deposits, which could be cheaply worked, had been developed in New Caledonia, Rhodesia, and other countries. When, however, our entry into the War made it imperative to use ships for military purposes, the Government instantly asked the Geological Survey and the Bureau of Mines whether a number of essential minerals, which previously had been supplied from abroad, could not be produced in sufficient quantity here to meet the requirements of the makers of munitions. The answer was affirmative concerning chrome, manganese, pyrite, and various other minerals. Accordingly an appeal was made to the people, in the name of patriotism, to prospect for these essential materials; to hasten their production; and to arrange through the appropriate committees at Washington for their distribution to the consumers. It was suggested, as a matter of course, that the price also would be fixed officially. In the case of chrome ore after a time a basic price was established through a subsidiary company established in San Francisco by the leading consumer. To this the objection might be offered that it would have been a more regular procedure to have done it through the proper committee of the War Industries Board or at least by an agency not suspect of turning the opportunity to its own advantage. The fact that disaster has followed, that the chrome producers generally have been left without a remunerative market, and indeed with no demand beyond that already covered by contracts, lends point to the criticism of the manner in which the business was handled for the Government. It cannot be the intention of the Administration to urge men to enter into new and untried ventures for the sake of supplying the Nation's need in War and then to leave them financially ruined; it is such a plain case of moral responsibility that but one answer can be given: these men must be provided with an outlet for their ore at prices that will avert loss. By means of an organization it will be possible to collect such definite information as will enable the officials to adjust measures for relief. The chairman of the Association is Mr. C. H. Holbrook of San Francisco.

HEARTY thanks from the public are due to the New York 'Tribune,' which has been conducting a vigorous and effective campaign against Hearst and his reptile press. The 'Tribune' is Republican and Hearst, unfortunately for his party, is Democratic, but we assume confidently that the attack by the 'Tribune' is not made for political but patriotic reasons, otherwise we would not commend it so unreservedly. It is true, Hearst caused placards purporting to be an official condemnation of the 'Tribune' to be posted in post-offices and railroad stations, but the Post-Office Department, on September 26, issued a notice to postmasters ordering them to remove such posters from their offices. The forces of commercial graft and press prostitution have combined to fight the 'Tribune' in New York. When that great newspaper began its exposure of Hearst's devious ways, the newsdealers joined in the fight, refusing to sell the Hearst publications, of which there is an intolerable number, as our readers are aware. Thereupon the members of the New York Publishers' Association, except the 'Tribune,' decided to treat the action of the newsdealers as an illegal boycott. This meant that any newsdealer that refused to sell Hearst's 'American' or 'Journal,' or reduced his daily orders for them, could buy no other morning or evening paper. Evidently the Publishers Association feared the exercise of such discrimination by the newsdealers, because it might be used against any one of them and it might lead to a demand for a general reduction in the price of papers; in short, the publishers feared a trespass upon their power. This compelled the 'Tribune' to announce that it would sell its papers through all newsdealers alike, whether they handled the Hearst papers or not. To this the Publishers Association replied by commanding that the circulation of the 'Tribune' be restrained; it notified the American News Company not to deliver the 'Tribune' to anti-Hearst newsdealers. The News Company, which enjoys absolute control of the distribution of morning papers in New York, refused to deliver the 'Tribune' to newsdealers that had either cancelled or reduced their orders for the Hearst papers. At this point the 'Tribune' had to decide either to compromise or lose control of its own circulation. It chose to continue the unequal fight. First it met the newsdealers' economic difficulty by decreasing the price of its paper from $1.40 to $1.20 per hundred. Immediately the News Company refused to deliver the 'Tribune' to any newsdealer except at the old price. Not content with dictating to whom the 'Tribune' should be sold, the News Company decreed the price at which that splendidly belligerent paper should be sold. To this the 'Tribune' replied by organizing its own delivery system, a most costly operation. The Tammany administration of New York revoked the licenses of the anti-Hearst newsdealers, whereupon injunction proceedings and incipient riots ensued. The good fight proceeds. We give an account of these events in order to arouse public support in behalf of the 'Tribune,' to which we extend our compliments and best wishes. *Delenda est Hearstiana!*

Vive la Belgique!

Men love to personify a cause; to us the Kaiser epitomizes Prussian aggression; to the German our President stands as the symbol of American purpose. There is another that emerges as the standard-bearer of a gallant people; to King Albert of Belgium the civilized world turns today with a glad smile of hearty congratulation. During a period when many kings and emperors have gone into the discard it is remarkable how the democracies have given the homage of their respect to the titular chief of the Belgians. He has shown himself a constitutional monarch, not a Hohenzollern nor a Hapsburg, and like the kings of a more romantic era he

has not hesitated to take his place at the front of battle among his own soldiers. It seems long ago since that black hour when Germany called upon Belgium to allow the gray swarm of invaders to pass through on their way to France, and Belgium, refusing to be a road, asserted herself a nation. At the critical moment, on August 4, 1914, King Albert, addressing the Belgian parliament, said: "I have faith in our destiny. A country that defends itself gains the respect of all. God will be with us in this just cause." The German horde drove the Belgian army to the farthest corner, but not out of Belgium; they passed over the country, devouring and devastating; it looked as if Belgium were to be crushed utterly. It was then that the indomitable spirit of the king fired his people with the resolve not to submit. The Kaiser, looking with a sneer at his victim, might be supposed to say: "So, you see, you've lost everything." To which King Albert replies: "Not my soul." He preserved his unconquerable soul in patience and in resolution until the tide of battle should turn and the embattled democracies should have time to prepare themselves to drive the barbarian back and re-assert international law. Four years of bitter suffering for his people and four years of courageous fighting for him and his army had to pass before the king could flash his sword joyously and lead the return homeward. The triumphal march of that little army, supported by the hosts of the Allies, expresses the resurrection of Belgium from the tears and the ashes of a fearful calamity; it symbolizes the true meaning of the tremendous conflict that has raged for these long years; it is an augury of the complete vindication of the rights of the small nations as against the callous violation of their independence by the arrogant militaristic powers of feudal Europe. In Serbia likewise the tide has turned; the despoilers are being driven northward and the remnant of the native army, still full of fight and tenacious to the end, is marching to victory, conscious that at last they are regaining their hearths and homes for good. To King Peter and to King Albert *nos salutations les plus sincères!*

Inflation and Credits

It is a pleasure to present so cogent an analysis of the meaning of inflation, and of the relation that gold production bears to the country's finances, as that contained in the excerpt from the October bulletin of the National City Bank, printed in our last issue. It is not a statement of remedies; it is a piece of surgery, laying bare the peril threatening our existing credits, which have been developed at the call of extraordinary production and exorbitant prices. The resulting obligations cannot be liquidated at their face-value except there be an adequate supply of gold. To have such a supply necessitates an uninterrupted output at maximum capacity. In the inevitable re-adjustment of 'values'—we think 'prices' would have been the better term—after Government orders have ceased, the one sure way to prevent the accumulated obligations from shrinking, through inability to collect their full value, is to prolong the period of liquidation. That necessitates the enlargement of credits to cover old transactions as well as to sustain the active commercial movement of the period. It involves an increase in the burden that the banks must carry. The economists of the National City Bank recognize that something is needed to prevent collapse, and, as representatives of an institution that has offered wider facilities of finance to the budding enterprises of Brazil, of the Argentine, and of far-away China and India, to say nothing of the great services performed in the busy marts of the United States, they properly take the position of the cheerful optimist. They predict a great industrial boom after the War; many others have prophesied the same. They refer to the volume of "waiting orders" that will "sustain prices or moderate their decline." We are fully as optimistic as they; perhaps we are all catching the optimism of the indomitable French; but we realize, too, how important it proved in the history of civilization that France, in time of peace, had made ready for war. In finance, as well, we must sustain our optimism by readiness for the opposing tide. When business grows dull, when men become fearful of the stability of demand and begin to slacken their productive effort, when contraction becomes the order of the day, and initiative slumbers, then the airy castles of bonanza times come crashing down, leaving distress and suffering in their wake—unless the sound basis of finance, namely, gold in sufficient quantity to pay every commercial doubter and every timid depositor, is ready at hand, and available as security for additional advances of credit. The amount of gold in the world today, in comparison with the total volume of trade, is but a fraction of that which served mankind in the days when the gold mines of California and Australia disturbed the economic structure and gave new point to the 'quantity of money' theory. There is no such superabundant quantity of gold today. It is all a matter of relative proportions. We need more than we have in order to put us back on a level with our financial position even of 18 years ago. We have not tested the ultimate security of our credit structure, and it is to be hoped that we may not need to do so. We must never forget, however, that it rests on gold, and that the foundation has not been widened in the same ratio as the size of the financial obligations, both ours and those of our Allies, that it is required to sustain. The American Bankers Association cited Secretary McAdoo as authority for recognizing the undiminished output of new gold as one of the most urgent war-essentials. Their acceptance of his statement will strengthen the Administration in its purpose to aid the industry as a national necessity. In addition to the statement made in the October bulletin, above mentioned, the National City Bank, in its monthly magazine entitled 'The Americas', takes the same position regarding the need of more gold after the War as that so clearly stated by the 'Commercial and Financial Chronicle', to which we referred on October 12. The argument appears on another page of this issue: "Interruption of the normal production of

gold, which would affect the supply for a term of years, would * * * intensify the reaction from the present period of inflation, when it comes." It will be observed that the managers of the National City Bank, despite their confidence in a period of great industrial activity after the War, express no doubt as to the reaction from the credit-inflation that war has engendered. They do not assume that normal business will maintain the same degree of exaggerated banking accommodation that is permitted today. These credits have been necessary to facilitate the military enterprise of the Nation, but, after all, they are not based on imaginary services; they represent the current needs of material for making the implements of war at a time when the active buying of the Government has been the chief contributing cause of high prices. Debits and credits are the warp and woof of the fabric of commerce; the relation of one to the other must be sustained or the fabric becomes but a tangled skein. Continued credits, covering past obligations, must be extended for a considerable period after the returns to the manufacturer or merchant have become reduced because of the falling prices, in order to avert catastrophe. The whole world cannot liquidate at once out of reduced receipts; the time of settlement must be lengthened, and it must be so done that public confidence be not impaired. Confidence will be sustained so long as the banks carry what the business world has ascertained to be a safe proportion of gold to guarantee outstanding obligations. We publish this week an illuminating statistical presentation of this subject by Mr. H. N. Lawrie. From this will be seen the relation between trade balances and the gold movement, together with the bearing of these upon our present stock of the monetary metal; at the same time Mr. Lawrie shows the extent to which the gold-reserve has been utilized as a basis for governmental credits. This is approximately 1:12, without taking into consideration the commercial credits extended by the banks. We believe that the expansion in these alone will prove to exceed the ratio of 1:20. It is the problem of pulling this balloon back close enough to the solid earth for the reasonable safety of the passengers in the business-basket that concerns the financiers. The National City Bank says that the best way to tide over the difficulty of the gold miners, so as to maintain a steady flow of metal to the Treasury, is to pay a bounty.

Platinum

Lethargy has characterized the administration of the platinum industry by the War Industries Board and it seems not to have been overcome. Efforts antagonistic to the effective exercise of its authority are still being made. No more than two weeks ago dispatches emanating from interested parties at Washington have encouraged the delusion that some new catalyzer had been found capable of replacing platinum in the manufacture of sulphuric acid. Leading producers of that chemical deny that such a catalyzer has been perfected. Energetic research has been made to find a satisfactory substitute for platinum and some advance has been scored, but the goal has not been reached. Mr. C. H. MacDowell, of the War Industries Board, recently informed Mr. Charles H. Herty that experiments conducted under his direction had been "so promising that appropriations had been made for extending the investigation on a larger scale," and he was "rather hopeful of success." Also, Mr. F. G. Breyer, of the New Jersey Zinc Company, who has been pursuing similar studies, stated that "some progress has been made, but it will require three or four years of intensive research by the best men in the country to bring about a successful solution of this problem." The War Industries Board evidently is basing its expectations of immediate relief upon the voluntary surrender of platinum jewelry, and upon limiting the use of platinum for any purpose in the arts under a system of licenses. Meanwhile the sale of platinum jewelry now held in retail stocks has not been interdicted. The remedy proposed is inadequate. The figures presented by the Bureau of Mines show that, whereas platinum has been provided for plants having a total capacity of 2,200,000 tons of concentrated sulphuric acid, the new plants and the extensions of old ones, designed to meet our immediate requirements in the manufacture of munitions, demand platinum sufficient for an additional 800,000 tons of acid per annum. This is quite apart from the needs of the nitric-acid makers. In the production of tri-nitro-toluol ordinary chamber sulphuric acid will not serve nor can it be concentrated to the proper strength. Nothing but the fuming sulphuric will yield a stable quality of T. N. T., and this grade of acid can be produced only by the contact process, that is, by aid of platinum. The Government is short one million tons of fuming acid required for making the explosives needed during the remainder of the current year at the existing rate of consumption. To complete the new acid plants now authorized 32,000 ounces of platinum would have to be used in the catalyzers. In March the Government estimated that it needed 40,000; the exigencies of the War have so increased the demand that a revised estimate, made in June, placed the requirements at 69,000 ounces. The total output of new platinum in the world for 1917 was only 83,000 ounces, and a considerable proportion of that had to go to our Allies. It will be evident, therefore, that the War Industries Board is trifling with the interests of the Nation in pursuing a tender policy toward those who employ the metal for non-essential purposes. The necessary amount cannot be obtained without calling for a surrender of the objects of art, of which an abundance exists in the country; but the public is aware of the deference shown in this matter to the commercial interests. As long as it is possible to buy platinum jewelry in a store it is preposterous to suppose that the people can be impressed with the necessity of making personal contributions. No sentiment attaches to jewelry in the hands of a dealer, but for the individual it may be interwoven with loving remembrances, making it painful to surrender. Nevertheless a generous response at first met the Government's plea. Now, it is plain, the officials must invade anew the temple of Mammon if they are to expect sacrifices on a more sacred altar.

THIS LOOKS LIKE A LANDSLIDE, BUT IT IS A TRAIN OF CLARK CARS UNLOADING CAP-ROCK ON THE DUMP

The Utah Copper Enterprise—IV

The Mine (Continued)

By T. A. RICKARD

The mixture of races is noteworthy. Seven hundred laborers are employed on the railroad and dumps. I have mentioned the Greeks, Italians, and Albanians; to these, Japanese, Koreans, and even Armenians must be added. The various races are segregated into separate gangs, supervised by a foreman of their own kind, able to speak English, which most of the rank and file cannot do. The better tasks, such as switch-tending, flagging, and bossing are given to those that can speak English, most of these being paid 25 cents and some 85c. per day additional. The regular pay of a laborer is $3.40.[13] The men working underground are mostly Austrians and Mexicans, the latter preferring to call themselves 'Spanish' since our trouble with Mexico. For a similar reason the Austrians usually call themselves 'Serbian', since most of them come not from Austria proper but from Croatia and Dalmatia. The Dalmatians and Croatians that belong to the Greek Catholic church call themselves 'Serbians', whereas the Roman Catholics from the same provinces call themselves 'Austrians'. Greeks, Italians, and Finns also are employed underground. The Austrians and Italians talk about 'going home' after the War. Most of them have left their families in Europe. They complain that the Americans do not take them in, they feel backward in making friendly overtures, the result being that they continue alien and form local colonies of their own.

The use of coal by the steam-shovels and railroad-engines calls for remark. The coal comes from the Black Hawk and other mines of the United States Fuel Co. at Hiawatha, and also from the Kenilworth mines of the Independent Coal & Coke Co., all of which are in Carbon county, Utah, and about 130 miles by rail from Bingham. The cheapness of the coal explains the use of solid fuel instead of electricity. When the electric shovel has been more nearly perfected and other conditions are favorable, it is anticipated that the present coal-fired shovels will

[13]Increased on July 1 to $3.90. The foreign gang-bosses now receive $4.15 per day.

be supplanted. The frequent shifting of tracks and the danger from blasting are held to be unfavorable to electric connections.

After luncheon Mr. Carnahan and I mounted an ore-train and switch-backed along the line from the F level to the K level. These switchbacks have a 4% grade, compensated for curvature on the basis of 0.04 ft. per degree of curve. I noted a dozen Japanese engaged in laying track; I also saw the copper-precipitating plant in the Apex Yard gulch, and the old incline-tramway that served to take the ore from the bins at the mouth of the main haulage-level to the terminal beside the railroad. The abandoned rails and other scrap-iron seemed to invite use, either in a foundry or in a leaching-vat; indeed, I was informed later that this material is collected periodically and such of it as can be used to advantage at the foundry is shipped thither, while the inferior scrap, not saleable or suitable for the foundry, is used as a precipitant at the leaching-plant. I obtained a glimpse of the little settlement tributary to the Utah Apex mine, in which lead ore is being won from the limestone. This mine was being threatened by an apex suit to be brought by its neighbor the Utah Consolidated, as I guessed by the recent inspections made by Messrs. H. V. Winchell and A. C. Lawson, both notable experts in such semi-scientific contests. In this part of the district the fissuring of the limestone has formed lenses of ore containing lead and copper, the latter being the first to 'peter out' in depth. Three years ago the Utah Apex mine was the scene of a story worthy of a moving-picture performance.

On November 21, 1913, Rafael Lopez, a Mexican, shot and killed another Mexican named Juan Valdez while they were on their way to the Highland Boy mine. The two actors in this melodrama had been neighbors in southern Arizona; later, in Mexico, the brother of Lopez had won a girl that Valdez desired; the disappointed lover had revenged himself by killing the successful suitor, burning his body. Rafael Lopez was informed of the deed and waited his chance to get even.

After various wanderings in the mining districts of the South-West Lopez came to Bingham at the time of the strike in 1912. He was one of a number of 'strike-breakers' brought thither to settle an industrial quarrel in a crude way. He met Valdez, but pretended to be ignorant of the circumstances of his brother's murder, until, at last, getting into a political argument with Valdez and another Mexican on the road to the mine, he turned on the latter, whereupon Valdez interfered, drew a knife, and was shot promptly by Lopez. Having done so, he turned back, went to his house in the upper gulch, got his rifle and cartridges, and left town.

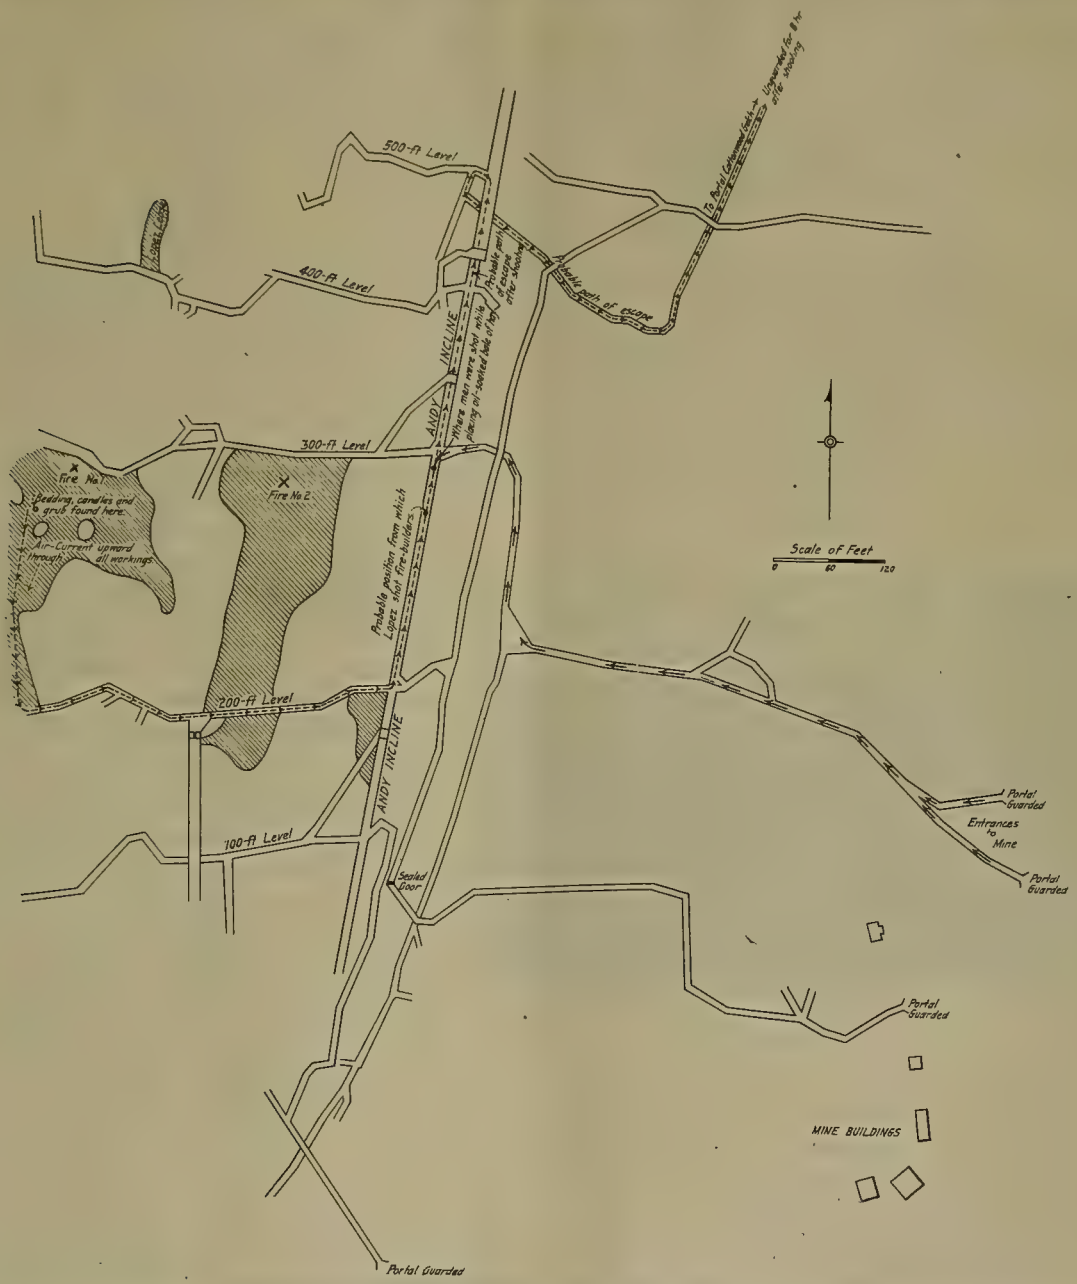
Another story is that Lopez was in love with a Spanish girl, called Inez Ocaro (or Ocarriz) living at Bingham, and that he had bought a box of candy to present to her when, on arrival at her home, he found Valdez there. He waited for his rival to come out and then shot him. The first story is the more probable.

Before this event Lopez was known locally as a good-natured fellow, honest in his dealings, and successful in his operations as a lessee in the Apex mine, where he had made $10 to $20 per day. He had been educated in Texas, his mother being English and his father Spanish. He knew that, as he was a 'Mexican', the officers of the law would give him short shrift, so he prepared to resist capture. Moreover, a few months previously, coming to the aid of two girls that were being molested by a couple of Greeks, he had knocked them down, but his part in the affray had been misconstrued by the deputy-sheriff, Julius Sorenson, and he had been sent to jail. This had embittered him against the officers of the law.

As soon as it became known that he had killed Valdez, the officers went to his house and followed his tracks in the snow across country about 40 miles from Bingham to a ranch near Utah Lake owned by a man named Jones. The four officers were searching for him when he opened fire, killing three of them, but missing Sorenson owing to a defective cartridge. The news soon spread and caused intense excitement. Posses were organized and hurried to the scene of the tragedy, where the Sheriff, Andrew J. Smith, took command of the man-hunt. All sorts of wild rumors spread. Meanwhile the leading posse followed the outlaw's trail into the rugged mountains above the lake. Suddenly a shot rang out and the bullet struck a rock close to the pursuers. The posse sought cover and remained in hiding until evening, returning to quarters for the night. Next day, reinforced and led by the Sheriff, they surrounded the spot where Lopez had halted them, but found only a few empty pistol-cartridges. His poor aim was explained by the fact that he had used his revolver instead of his rifle. A day or two later, on November 26, Lopez returned to Bingham at night, going to the house of a friend, Mike Stefano, who lived in one of the Utah Apex company's houses, close to the No. 2 Tunnel on the Minnie claim. His feet had been frost-bitten and he was lame. He took Stefano's rifle and 40 rounds of ammunition; he also asked for some clothes, a couple of quilts, bread and meat, and made Stefano carry the provisions to the entrance of the Minnie workings. Stefano reported these facts to Tom Hoskins, the foreman of the mine. Immediately the officers of the law were notified and guards were placed at the openings of the mine and in the various workings. The bandit was trapped; but he had miles of workings in which to hide. He was familiar with these workings, for he had been 'leasing' on the 400-ft. level, near the shaft, for several months. He could find his way in the dark. To search for an outlaw at bay in the darkness of a mine was foolish, so it was suggested that he be smoked out, although Mr. V. S. Rood, the superintendent, expressed his opinion that the extent of the workings—20 to 25 miles in aggregate length—would nullify the attempt. A dash was made by 15 men in a steel-protected ore-car, but they found no trace. Lopez 'held up' several miners underground, without hurting them, only taking their candles. The deputies were quite unable to track him to his lair. Intense curiosity prevailed. The whole of Utah was aroused. Everybody had his own idea how to catch

the desperado, without undertaking to perform the feat. He was known to be a remarkably good hip-shot, that is, he could shoot accurately without sighting.

The Sheriff ordered the superintendent of the mine to cease work on the upper levels, but the miners had been lights were placed so as to illumine the surface. Fresh fires were about to be started. Four men climbed with a bale of hay up an incline, called the Andy; two were pulling and two were pushing the bale over a pile of waste at the bottom of a big stope when suddenly three



THE MINE-WORKINGS IN WHICH LOPEZ SECRETED HIMSELF. THE ARROWS ON THE LEFT SHOW HIS PROBABLE TRAIL; THOSE ON THE RIGHT INDICATE THE MOVEMENTS OF THE POSSE

scared and operations had been half-hearted since the affair began. At last, unable to track the desperado, it was decided to try smoke. The guards were doubled, some of the outlets of the mine were sealed, others were watched with increased vigilance, and powerful search-

shots broke the silence of the mine. One man was killed at once and his body rolled down the incline; another fell and crawled aside, groaning horribly. The remainder of the posse tried to recover the bodies of their comrades, whereupon Lopez came down the slope, so as to see better,

and opened fire again, without causing further casualties. The deputies escaped to daylight. This was on November 30. The next day the Sheriff conferred with Mr. Rood, the superintendent, and Tom Hoskins, the foreman; the result being a decision to bulk-head the levels and fumigate the whole of the upper workings until every part was saturated with gas. They could ascertain when the oxygen in the air of the mine had been consumed by the fact that the fires would refuse to burn further. Among the combustibles used, or suggested, were formaldehyde, potassium permanganate, lump sulphur, green wood, damp gunpowder, oil-soaked cotton-waste, and cayenne pepper. The fires were kept alight for five days. It cost the Utah Apex company several thousand dollars and threw 200 miners out of work for 10 days.

By this time public excitement had reached a climax. The Governor offered a reward of $1000 for the capture of Lopez. The newspapers made the most of the man-hunt. During intervals the daily press gave full space to describing the funerals of the victims of the chase. Betting was lively. When the bulkheads were removed, on December 5, and search for the supposed dead body of Lopez was begun the next day, it became evident that the local betting was lending a gruesome zest to the examination of the mine. Many felt sure that he had escaped; he was reported as seen at several localities; one person acknowledged to having received a letter from him post-marked Salt Lake City. On December 10 the girl Inez Ocarriz stated that she had talked with Lopez in the Andy tunnel; three days later a shift-boss claimed to have been accosted by him underground and he had sworn to die fighting. The officers did not abate their watchfulness, relying upon starvation to finish the pursuit. Stefano's blankets and other traces of Lopez were found in the fifth stope of the Andy incline. Another stope, in which he was imagined to be, was dynamited by the Sheriff, after a melodramatic call to the desperado to surrender. Nothing came of it. Those who saw the dense clouds of smoke that issued from the mine-openings when the bulkheads were removed decided that no human could have survived the effect of them. Days passed; the mine was ransacked from end to end, public interest waned, several guards resigned, and the Sheriff had to bring the fiasco to an impotent conclusion. I am told that there was dispute as to how the desperado managed to get food while in the mine, the most likely suggestion being that "he lived on the milk he got from the Sheriff's goat." Lopez was never seen again. His fate remains unknown. It is probable that he escaped during the confusion and delay following the shooting underground, for 24 hours elapsed before the workings were sealed.[14] Perhaps he became a *revoltoso* in Mexico and under a new name now plays the part of a constitutional reformer south of the Rio Grande.[15]

Returning to the Utah Copper, the block-signal system is not in use on the mine-railway. No less than 120 men are employed as switch-tenders. This will afford suitable employment for crippled soldiers returning from the War.

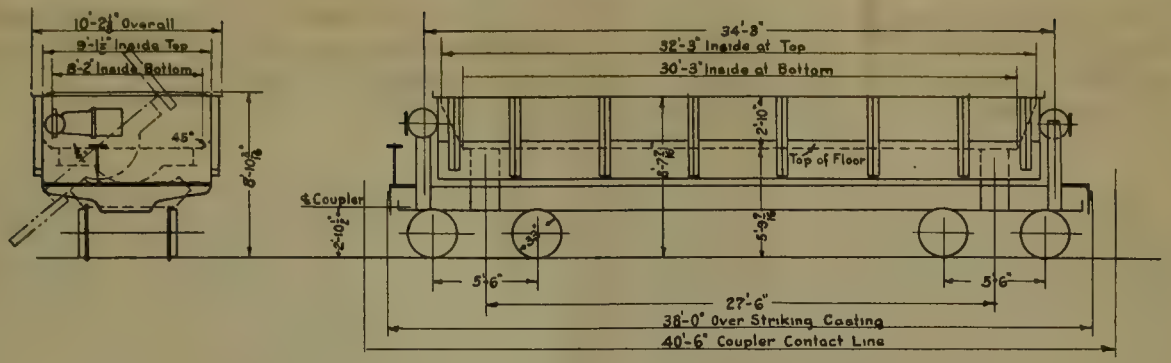
From the K level I obtained a new view of the surficial workings. We walked along this terrace, which curves south-eastward, to the far end, where I noted the disposal of waste removed in the course of 'stripping'. Here, in Galena gulch, 8,000,000 cubic yards of rock has been stored, leaving room for 15,000,000 more. The waste discarded in the past has been about equal to the ore won, but in the future the proportion of waste to ore will decrease gradually. Last year 4,271,868 cu. yd., or 8,827,400 tons, of cap was set aside while 6,038,900 cu. yd., or 12,542,000 tons, of ore was sent to the mills. The cap-rock of carbonate ore is kept separate by removal over a railroad that crosses Bingham gulch and passes along the east hill to Tiewaukee, McGuire, and Little Eddy gulches, where 20,000,000 tons of it, containing 0.65% copper, is stored until it can be treated at the leaching-plant in the Salt Lake valley. Below the dump of brown monzonite is another consisting of quartzite, from the edges of the orebody. This contains only 0.3% copper.

Turning round, so as to face south, toward the dumps of 'stripping', I noticed groups of men on each of the L and M levels. These were gangs of 12 to 20 laborers, engaged in dumping cars, moving track, and shoveling rock. Three kinds of cars are in use: the Clark automatic car, of 30 cu. yd. capacity; the Oliver, of 12 cu. yd. capacity, dumped by hand; and the crab-cars, of 6 and 4 cu. yd. capacity, these last being confined to the three uppermost levels. The inferior cars are being replaced gradually by the superior, the poorer type going up-hill. Crab-cars are used only on the two uppermost levels. As an example of the foresight of the Utah Copper management I mention the fact that the south end of the property was tested with churn-drills before it was covered with waste, thus avoiding the blunder, made in other districts, where 'stripping' has been spread on ground that subsequently proved ore-bearing and suitable for steam-shoveling. The surface of Galena gulch covers the workings of many notable mines, such as the Jordan, Telegraph, Spanish, and Galena, which have yielded many million dollars in lead and silver. Looking across, over the wastage from the big mine at my back, I noted the excavations in the underlying limestone. It was a quiet spot, detached from the intense activity of the mining operations; the tender green of the spring foliage nearly covered the old scars made by the miner; from the farther hillside came the sound of cow-bells, and from the long grass a meadow-lark carolled rapturously.

It would be pleasant to leave Bingham with the song of the lark in our ears, but a respect for the realities compels me to confess that, my visit being concluded, I walked down the gulch from the mine-office to the rail-

[14]Mr. Rood, in a recent letter to me, says: "Lopez had access to the seven levels on the incline, as well as all the workings in the old York, Petro, and Phoenix mines. If he had desired, he could have held-up the hoisting-engineer on the 700-ft. level and taken a chance to reach the lower levels by climbing down the main shaft."

[15]For my information I am indebted to the files of the 'Deseret News' and to a pamphlet, by one of the hoist-engineers at the Utah Apex mine, entitled 'Utah's Greatest Man-Hunt; by an Eye-Witness'.



THE CLARK 30-YARD STEEL DUMP-CAR

road-station, and on my way passed through the settlement of Upper Bingham. The road is the main street and under it is the flume to which the creek is confined. On each side are dilapidated houses, interspersed with cheap-looking cinema-halls, abandoned saloons, in some of which 'soft drinks' are sold, and bedraggled stores, with windows in which gaudy apparel is displayed. The smell of Cairo and whiffs from the Levant are confirmed by the tongues of south-eastern Europe, by Greek and Italian and undistinguishable dialects. It is a *cloaca gentium,* an unromantic and unlovely reminder of an un-Americanized community.

Such herding of un-assimilated fragments of Europe is opposed to the nation-making process. Filth and ignorance must be removed if we are to develop a healthy democracy. Upper Bingham is a warning to the American patriot. It is symptomatic of our Western mining districts and of our Eastern industrial centres. The mere fact that hundreds of men employed at a mine speak only foreign tongues, and make no effort to learn the language of this country, is a menace to our national development; and if to this linguistic isolation is added unsanitary ways of living, how may we expect to produce good citizens? To produce large quantities of copper cheaply is a useful achievement, but the making of good citizens is a process even more enriching to the United States of North America.

This may seem to be no part of my subject, but I mention it as one of the many impressions left by my visit to the great mine. The Utah Copper Company has tried, several times, to purchase the ground on which the settlement of Upper Bingham is situated, but such unreasonable prices have been asked that no purchase was practicable and no betterments have been possible. Most of the men living there are the employees of neighboring companies. The few employees of the Utah Copper, and single men only, that live in Upper Bingham are in boarding-houses operated by lessees. I am glad to add that the Company is subscribing to an institution at Bingham that has established classes for teaching foreigners the English language and American ideals. This shows that public sentiment has been awakened to the urgent need of Americanizing the alien elements that constitute so large a part of our population.

At Garfield, between the mills and the smelter, the Utah Copper company has built 750 houses that are leased at low rentals to employees and form an attractive settlement. Everything of this kind is a step in the right direction. Industrial enterprises have obligations as well as privileges, and it is a sign of the times that those in control recognize their responsibilities, not merely as engineers, but as good citizens in a democracy.

THE ENTRANCE TO THE MINNIE WORKINGS OF THE UTAH APEX MINE

Taking the train for the return journey, I asked a fellow-passenger about the Japanese. He said they were "right up to the mark on Red Cross and Liberty Bonds." At Magna the mill-hands boarded the train and I found myself in the crowd with which I had come out in the morning. While the train halted, I noticed a stalwart young fellow, a brakeman, shaking hands with several friends in farewell. He had been drafted and was off to the War. It seemed a far cry from that wayside station overlooking the Great Salt Lake to 'somewhere in France,' but the copper that I had seen being mined at Bingham had the same destination, and was to be used for the same purpose, the greatest purpose in the world just now: to stop the march of the goose-step over creation, to frustrate the designs of the Prussian outlaw, and re-establish good faith among the nations.

The Zeebrugge Affair

[Herewith we publish an account of the gallant manner in which the harbor at Zeebrugge, a German submarine base, was blocked last April. The story is told by one of the officers participating in this heroic enterprise. We have added a map, so that the description can be followed easily. It is rendered more interesting by the actual capture of Zeebrugge.—EDITOR.]

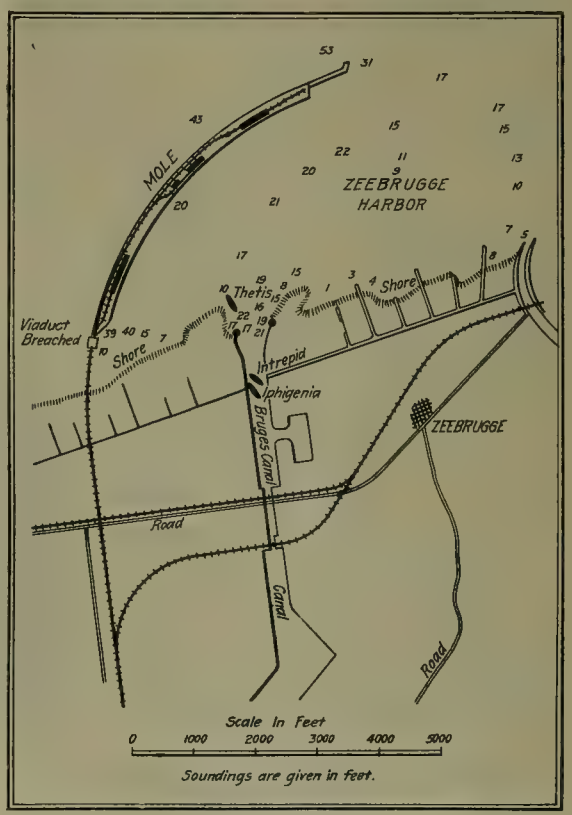
The problem that lay before us was far bigger and greater than the landing on the mole, or any mere spectacular features. It was vastly different from merely sending one or more ships into a harbor protected by shore-batteries, because the channel to be blocked was narrow and a ship or ships must be placed carefully to make the effort successful. Moreover, the waters through which the vessels must dash were under the protection of heavy guns, which commanded the sea practically for 15 miles out from the coast.

This meant that the vessels, with the blocking-ships, must arrange their dash under cover for 15 miles; and then, having run the coast-batteries, they must go close to a heavy battery upon the mole, located about a mile out in the harbor, and able to fire practically point-blank at the attacking vessels. And then, of course, another run of 15 miles had to be made under fire of the near shore-batteries of the mole and the heavier coast-batteries of the mole and the heavier coast-batteries, as well. The German mine-fields also had to be circumvented.

Various elements had to be taken into consideration. Naturally the dash must be made at high tide. There was only one way in which we could hope to protect the vessels if the raid were made in daylight, and that was a smoke-screen. But aeroplanes, scouting above, would lay a fleet open to observation and to the same attack by indirect fires as on land. So the dash had to be made at night, and on such a night as the tide would be high at about midnight, for the ships must go in, do their destruction, and then come out again before the shore-batteries would have the daylight to help them.

There were something like 150 guns on the shore commanding the 15-mile radius. If these discovered the vessels, none of the ships could have lived through the shower of shells. As the batteries all had the use of searchlights and star-shells, it became necessary to take measures to prevent the ships being seen by any method of illumination until the last moment. That necessitated the use of smoke-screens. A smoke-screen is of little use unless it approaches with you; thus you must always have the wind blowing in your direction of advance. In our case it was from the north. The use of any craft to make smoke would not be effective unless it continued up to the coast, making smoke to the last minute. This necessitated light-draft vessels, and then in turn required calm weather.

So the conditions necessary demanded high water occurring at a particular period of the night, wind blowing directly into the harbor, cold weather, and, of course, no fog, for the latter would prevent the blocking-ships from finding the coast. Having attained these, there still were other matters to be worked out. In order that the blocking-ships might find their destination it was quite obvious that they must be able to see for a certain distance, say, for a mile or two, at least. And this means



THE PORT OF ZEEBRUGGE

that the moment the entrance to the canal was in the same area of clear atmosphere with the blocking-ships, namely, during the final run in, the shore-batteries on the coast-line also would be in the clear weather and able to concentrate on the blocking-ships, much to their detriment.

This applied both to Zeebrugge and Ostend, where the German batteries are on the actual coast-line. But at Zeebrugge there was the additional obstruction of the mole. This extends rather more than three-quarters of a mile from the entrance of the canal. The outer end of the mole had been turned into a veritable fortress. The position of the navigable channel leading to the entrance

was such that the ships were forced to pass close to the batteries on the mole, and it was too much to hope that they would be able to do this and pass inside these batteries and then meet the full blast of the shore-batteries without being sunk before reaching the canal. It therefore became clear that it would be necessary either to destroy or to divert the attention of the mole-batteries before the blocking-ships arrived in the vicinity, and in the latter case to keep them diverted until after the ships had reached their destination.

The German garrison on the mole was believed to consist of about 1000 men. It was decided to storm the mole with special parties immediately prior to the arrival of the blocking-ships. The necessity of holding the mole for a time would also provide opportunity to carry out a certain amount of destructive work on the mole. The possibility of reinforcement coming from the shore and preventing the storming party from attaining its object was to be countered by cutting the mole off from shore by blowing up the railway-viaduct.

The mole is a mile and a half long, and 80 yards wide. On the outer side it is flanked by a wall 30 ft. high. Five feet below the top of this wall is a narrow gangway or parapet running the whole length of the mole, with an iron hand-rail on its inner side. From the parapet there is a 16-ft. drop to the mole proper. The inner side of the mole is fitted to allow ships berthing alongside; whereas it probably was never considered that any ships would wish to berth along the outer side. The ships carrying the storming party could not go along the inner side of the mole without passing close to the mole-batteries, and thereby risking the certainty of being sunk. Therefore it was necessary for these vessels to be secured alongside the parapet of the mole, and for the storm parties to climb over the 30-ft. wall down to the parapet, and thence over the hand-rail and drop 16 ft. to the mole before they could attack the mole-batteries.

The operation went like clock-work. The 'Vindictive,' 'Iris,' and 'Daffodil' advanced alongside the mole in spite of the heavy fire from the mole-batteries. The arrival was at one minute after 12 o'clock at night, April 22-23, and the storm party disembarked on the mole immediately. The 'Daffodil,' pushing the 'Vindicator' alongside the mole, enabled this to be done. Because of the roughness of the sea the 'Iris' had difficulty in securing to the wall, and finally went alongside the 'Vindictive' with the intention of disembarking her men over that ship.

The Germans appear to have been taken completely by surprise. Immediately they heard the approach of the vessels they fired many hundreds of star-shells. But the smoke-screens prevented them from discerning the nature of the attack until too late. An old submarine, fitted with explosives, had run into and secured herself under the viaduct, and had been blown up after the crew had escaped in a small dinghy. This terrific explosion in their rear, the attack of the storm party in their midst, and the general confusion that must have reigned among them, were probably the cause of the Germans not noticing the approach of the blocking-ships. These passed close around the end of the mole and made direct for the canal-entrance. The leading ship, the 'Thetis,' was heavily engaged by the shore-batteries, but, although in a sinking condition, managed to direct the other vessels toward their destination. The 'Thetis' herself struggled on, and finally sank close to the canal entrance and right across the stairway. The 'Intrepid' and the 'Iphegenia' proceeded into the canal-entrance and sank in the positions ordered by blowing out their bottoms by mines especially placed for the purpose. Motor-launches had followed after the three blocking-ships and under terrific fire from almost point-blank range they went around the sunken vessels and took off their crews. This rescue-work was so magnificently carried out that practically none of the crews of the three blocking-ships was lost.

When it was considered that sufficient time had elapsed for the blocking-ships to do their work and for the crews to be rescued, the order was given to the storming parties to retire from the mole. While the 'Vindictive' and her consorts were actually alongside they were comparatively safe from fire except in the case of the upper works, which rose above the mole. The big funnels and masts of the 'Vindictive' had been riddled through and through, and many casualties were caused by flying splinters. As soon as the order to retire was given the storm-parties re-embarked. Some had been killed, several severely wounded, and yet out of about 400 men that had stormed the mole less than a score were left behind, in spite of the 16-ft. climb up the ladders and over the parapet. There must have been many acts of great gallantry to enable men who could not walk to be carried back on board amid heavy fire of the light guns on the mole and shell-fire from the shore-batteries, which had commenced to shell their own mole as soon as they discovered it was in our possession.

It was fully realized that immediately the ships shoved off the mole they would come under the concentrated fire of every battery that could bear. The 'Iris,' on leaving the 'Vindictive,' was severely hit and suffered many casualties, but the 'Vindictive' herself and the 'Daffodil' bore charmed lives. All three ships retired to the northward whilst emitting smoke-clouds to cover their retreat. In addition to the vessels already mentioned, a large number of small craft took part in the operation, and it can safely be said that any failure on the part of a single unit might have prevented the success of the whole expedition. Small motor-boats steamed up and down close to the shore-batteries, treating the latter with utter contempt. Destroyers supported the small craft, bombarded the enemy batteries, and assisted in the rescue-work with equal contempt of danger.

Vice-Admiral Keyes directed the whole operation, which had been prepared under his own supervision, from the 'Warwick,' and did not leave the scene of operations until the last of the blocking-ships' crews had been recovered. The spirit and determination with which he had imbued all his officers and men and his great quality of leadership made success as near a certainty as possibly could be done.

Determination of Chromic Oxide in Chromite

By W. C. RIDDELL and ESTHER KITTREDGE

*INTRODUCTION: The method described below was developed for the rapid determination of chromic oxide in ores and mill products submitted for analysis in connection with the War Minerals Investigation, being conducted by the U. S. Bureau of Mines. No particular originality is claimed for the method.†

The procedure has, however, been carefully standardized and data have been obtained regarding several important factors that may affect its accuracy.

ANALYTICAL PROCEDURE: The ore should be ground to about 100-mesh. Weigh out 0.5 gramme and brush into a 20-cc. spun-iron crucible in which has previously been placed 4 to 5 gm. of sodium peroxide. Mix thoroughly by stirring the charge with a glass rod, cover with a little sodium peroxide and fuse at a red heat. After the charge has melted, it should remain in the molten condition for five minutes. Allow the crucible to cool, place in a 400 to 600-cc. beaker of pyrex or other low-expansion glass, add about 100 cc. of water and digest until the fused mass has disintegrated, after which remove and rinse the crucible. Boil for at least five minutes to decompose the sodium peroxide. Without filtering, neutralize the solution with 1-4 sulphuric acid and add 25 to 30 cc. excess. Dilute to 300 to 400 cc. with cold water and titrate with a standard solution (about 0.2N) of ferrous sulphate. A slight excess of the ferrous sulphate solution is added, as indicated by spot-plate tests with a weak solution of potassium ferri-cyanide (about ½% solution) and the determination is finished by back titration with standard potassium-dichromate solution. The ferrous sulphate solution may be added rapidly without great care, as the approximate end-point is easily recognized by the color change of the solution. With some practice three or four spot-tests should be sufficient to determine the exact end-point.

The quickness of the method is due largely to the omission of filtration before acidifying the solution, and to the use of a standard $FeSO_4$ solution. One determination requires about two hours and a set of ten can easily be run simultaneously by one operation. This corresponds to about 40 determinations in an eight-hour day.

PREPARATION OF SAMPLE: Contrary to the statement found generally in text-books, extremely fine grinding is not essential. Reduction to 100-mesh is ample for all purposes, as is shown by the following analysis of three samples, which were submitted to the standard procedure except in the matter of grinding.

	Chromic Oxide (Cr_2O_3)		
	No. 1	No. 2	No. 3
	%	%	%
Ground to pass 80-mesh	49.6	35.4	53.8
Ground to pass 100-mesh	49.6	35.4	54.3
Ground to pass 200-mesh	49.8	35.4	54.1

DECOMPOSITION OF SAMPLE: Chromite, which is more difficult to decompose than the minerals usually associated with it, yields readily to fusion with Na_2O_2. The so-called 'technical' grade of Na_2O_2 may be used. A spun-iron crucible is usually employed and will last for five or six melts. If care is exercised the failure of the crucible does not necessarily mean losing the charge and in some 200 determinations only two fusions have been lost in this laboratory. When iron, as well as chromium, is to be determined in the sample a heavy 20-cc. porcelain crucible should be used. These crucibles will usually stand three or four fusions. An electric or other type of muffle-furnace held at low-red heat is preferred for making the fusion. The bottom of the muffle should be protected by a thick sheet of asbestos board or 'transite'. The charged crucibles may be placed at once in the hot muffle without danger of spattering, and covers are unnecessary. When the fusion is made over a burner, the crucible should be covered and considerable care exercised to avoid spattering.

The following experiments were made to determine the time required for the complete decomposition of the chromite by fusion with Na_2O_2. All samples were ground to pass 100-mesh, and except for the time of fusion submitted to the standard procedure.

	Chromic Oxide		
	No. 1	No. 2	No. 3
	%	%	%
Heated until just melted.....	49.6	35.1	54.9
Fused 2 min. after melting	49.8	35.4	55.0
Fused 5 min. after melting	49.9	35.4	55.1
Fused 10 min. after melting	49.8	35.4	55.1

From these results it is evident that it is amply sufficient to hold the charge in a molten condition for five minutes.

DECOMPOSITION OF H_2O_2 IN SOLUTION: The following experiments, which were identical except as regards time of boiling, indicate that five minutes is sufficient to decompose the H_2O_2 (formed by reaction of Na_2O_2 with H_2O) in solution.

	Chromic Oxide		
	No. 1	No. 2	No. 3
	%	%	%
Acid added without boiling.....	...	48.1	54.0
Heated just to boiling.....	14.8	49.3	55.1
Boiled for 5 min.....	14.9	49.4	55.3
Boiled for 10 min.....	15.0	49.3	55.2

*By courtesy of the Director of the U. S. Bureau of Mines.

†The method is based on information from the following sources: 'Quantitative Chemical Analysis,' Fresenius-Cohn, Vol. II. Pp. 421-428 (New York, 1911); 'Analytical Chemistry,' Treadwell-Hall, Vol. II. Pp. 675, 16a (New York, 1912); and 'Volumetric Analysis,' Sutton-Volumetric Analysis, Tenth Edition. Pp. 186 (Philadelphia, 1911).

If any H_2O_2 is present in the solution when the H_2SO_4 is added, some chromate will be decomposed, leading to a low result. The alkaline solution containing the precipitate inclines to bump on boiling. A few chips of fresh unglazed porcelain or a solid stirring-rod with a roughened end, placed opposite one of the points where the beaker makes contact with the hot plate, minimized this difficulty.

Non-Removal of Precipitate From Alkaline Solution: The quickness of the method is partly due to avoiding the tedious filtration of the alkaline solution. Except when manganese is present, filtration is unnecessary as is shown by the following parallel determination on a number of samples.

Chromic Oxide		
Solution acidified without filtration	Solution filtered before acidifying	In precipitate
%	%	%
38.5	38.6	..
40.4	40.0	0.3
56.4	55.7	..
49.3	49.1	0.2
53.8	55.3	0.3
55.2	55.0	..
55.8	55.6	..
55.7	55.4	0.2

In certain cases the precipitate, after considerable washing, was dissolved in acid. This solution was then made alkaline, the precipitate removed by filtration, and the chromium determined in the filtrate. These experiments show that it is quite difficult to completely remove the chromate from the bulky gelatinous precipitate. The short procedure which we have adopted is therefore the more accurate unless interfering substances are present.

Interfering Elements: Determinations were made in which small quantities of cobalt, nickel, and copper salts were added to known samples before starting the analysis. These additions did not influence the result.

Manganese is the only interfering element that is at all likely to be found associated with chromite. When this is present it will appear in the form of hydrated di-oxide as a brown gelatinous precipitate after the solution has been acidified. In this case filtration is necessary. Filtration may be considerably facilitated by the addition of masserated filter-paper.

Preparation of Solutions: The standard $FeSO_4$ solution should be about 0.2 normal. This solution is prepared by dissolving 56 to 60 gm. $FeSO_4-7H_2O$ in about 800 cc. distilled water to which has been added 100 cc. concentrated H_2SO_4. The heat generated by the addition of the H_2SO_4 readily affects the solution of the ferrous sulphate. After cooling, the solution is diluted to one litre. The 0.2 normal $K_2Cr_2O_7$ solution may be made by dissolving 9.806 gm. C.P. $K_2Cr_2O_7$ in one litre. The $FeSO_4$ solution may be standardized with a standard $KMnO_4$ solution based on Bureau of Standards sodium oxalate, or against the $K_2Cr_2O_7$ solution, provided this was made from a salt of known purity. The $FeSO_4$ solution acidified as suggested is quite stable and if properly protected requires checking against the standard $K_2Cr_2O_7$ solution only two or three times a week.

One cubic centimetre of 0.1 normal solution is equivalent to 0.001733 gm. of chromium or 0.002532 gm. of chromic oxide.

Patents

The Naval Appropriations Bill, which was approved by the President on July 1, 1918, contains a provision relating to patents that possibly is of importance in connection with Minerals Separation:

"The Act entitled 'An Act to provide additional protection for the owners of patents of the United States, and for other purposes,' approved June twenty-fifth, nineteen hundred and ten, shall be, and the same is hereby, amended to read as follows, namely:

"That whenever an invention described in and covered by a patent of the United States shall hereafter be used or manufactured by or for the United States without license of the owner thereof or lawful right to use or manufacture the same, such owner's remedy shall be by suit against the United States in the Court of Claims for the recovery of his reasonable and entire compensation for such use and manufacture: provided however, that said Court of Claims shall not entertain a suit or award compensation under the provisions of this Act where the claim for compensation is based on the use or manufacture by or for the United States of any article heretofore owned, leased, used by, or in the possession of the United States: provided further, that in any such suit the United States may avail itself of any and all defenses, general or special, that might be pleaded by a defendant in an action for infringement, as set forth in Title Sixty of the Revised Statutes, or otherwise: and provided further, that the benefits of this Act shall not inure to any patentee who, when he makes such claim, is in the employment or service of the Government of the United States, or the assignee of any such patentee; nor shall this Act apply to any device discovered or invented by such employee during the time of his employment or service."

Potash and Blast-Furnace Gas

E. H. Lewis of the Glasgow Iron & Steel Co. publishes the following particulars of the amount of potash charged into the company's blast-furnace during the month of October 1917, and the amount recovered:

Charged into furnaces	K_2O %	K_2O per ton of pig-iron produced lb.
Iron ores	0.13	5.16
Coal and coke	0.05	2.15
Limestone	0.101	0.81
		8.12
Recovered		
Slag	0.146	1.63
Pitch	1.20	2.87
Tube-cleanings	2.23	0.07
Heavy dust from tubes	0.20	
Dirt from washers	1.20	
		0.07
Waste liquor	*2.49	1.58
Loss in running off slag and unaccounted for		2.10
		8.12

*Grains per gallon.

Need of More Gold

*The cost of mining gold, in the great goldfields of the world, is creating a new kind of 'currency problem.' The price of gold appears to be fixed because of its happening to be the standard of value; so many grains of gold to the pound, dollar, etc., being the method of standardizing the coinage of the money of the 'gold-standard' countries, it is inherently impossible to maintain gold parity and at the same time have gold, as a commodity, advance in price like everything else in the world. We have apparently come, in this war-time situation when we are seeing the fundamentals of finance as related to production and goods, to the point where the cost of running a gold mine is so high that gold either will have to bring a higher price or the mines must suspend. In South Africa, according to the recent reports of the meetings of the mining companies, the cost of getting gold is so high as to have compelled the British government to enter into some arrangement, the terms of which are not disclosed, although specific reference to it is made. In this country, also, the matter has come up in a serious problem.

Any proposal to put a smaller amount of gold into the standard coins, and so raise the price of gold by changing the standard, is declared by practical financiers and experts upon the subject to be out of the question. It would at once disturb the whole monetary situation, and as a re-adjustment would be faced when the reaction of prices that is ahead of us comes, we would have to undergo a double disturbance, and the expectancy of it would gravely affect credit. It would not even relieve the mining situation to debase the dollar, for costs, in terms of 'dollars,' would rise as the gold-value was reduced, and the whole proceeding would be merely juggling with words.

The problem is undoubtedly rendered more difficult by the fact of restriction of free sale and of the export of gold, as a war measure. On August 29, the Assay Office at New York was ordered by the Government not to sell any more gold bars to jewelers and others for "use in the arts" till further notice. It is reported from Washington that the Secretary of the Treasury has asked Congress to adopt a law against hoarding gold. The exportation of gold is restricted. Gold for manufacturing uses might sell at a premium, and it is believed that if our mining companies were free to export gold they would be able, for a time at least, to find markets abroad, for instance in Spain, where gold would be at a premium as against the dollar-credit, and even absolutely, and thus they might recoup themselves and incidentally help to get our trade-balances evened up on a cash instead of a credit basis. Such export would possibly be difficult to accomplish without running the chance of helping Germany in some way. However, the restriction of gold exports is generally ascribed as much to financial reasons —the desire to have a large store of gold for general credit stabilization—as to 'enemy trade' considerations, and it would seem as if the restrictions on domestic sale for manufacturing, and on export, were calculated to hold down the price.

There is another phase of the question, and that concerns the 'man-power' supply for war purposes. We need coal more than gold—if the gold miners were transferred to coal mining it would probably be an advantage, considering only the present conditions. But we will ultimately need the gold, and it would be dangerous to permit our gold production to be demoralized. Evidently the British government has seen fit to give artificial support to the gold mining on the Rand. It has been suggested that the soundest way to solve the whole problem raised by the cost of gold mining, under conditions of general price-levels and labor-shortage, which are regarded as temporary, would be for the Government to pay bonuses for the production of the gold, just as they are practically putting a bonus on wheat production, and thus to tide the industry over; for even the practical economists, who deplore general credit-inflation, which has given us so much credit-currency in place of gold as to be responsible for gold being so out of line as regards its price on a commodity basis, say that any interruption of the normal production of gold, which would affect the supply for a term of years, would be equally deplorable, as it would intensify the reaction from the present period of inflation, when it comes.

*'The Americas,' National City Bank, New York.

GOLD exports from the United States for August of this year amounted to $1,722,000, and for July $4,986,000. The total exportation of gold for the first eight months of 1918 was $18,073,000, against imports of $32,868,000, leaving a balance of imports of $14,795,000.

GASOLINE PRODUCTION of the United States in 1917, recovered from natural gas, totaled 217,884,104 gal., a gain of 111% over the output in 1916. The average recovery of gasoline per 1000 cu. ft. of gas by all methods was a half gallon. Oklahoma contributed 53% and California 13% of the total.

ALUNITE, many centuries ago, was mined in Smyrna, and for about 400 years in Italy, and was used for the production of potash alum. When the search for potash began in this country, it was believed that a deposit of alunite might be found and used as a source of potash rather than potash alum. Such a deposit was discovered in southern Utah, a few miles from Marysvale. Later it seemed that it would be necessary to discover some means of refining the alumina before potash could be produced in competition with Germany. Early in 1915, when the price of potash had risen to what seemed impossible figures, Howard F. Chappell and his associates of the Mineral Products Corporation, decided to build a plant, and this has been in continuous successful operation for three years, except for two shut-downs of one or two months each caused by fires. They are now producing and shipping about 600 tons of sulphate per month, the product being considerably better than 90% pure.

Review of the Gold Problem

By H. N. LAWRIE

Of the many complicated problems of war-production that the United States has confronted none offer more obstacles to correct analysis and solution than that of maintaining the output of gold on a normal basis. Much of the recent decline in the gold production of the world, and more particularly of the United States, involves an economic phenomenon unparalleled in history, and it is one that was not contemplated when the gold standard was adopted. Considering its far reaching importance it is strange that gold should be the last of a long list of metals to be given attention by the Administration. Apparently the monetary significance of gold does not carry with it the suggestion of utility in war as does lead, copper, or zinc.

That it should cost more to produce an ounce of gold as a commodity than the monetary price of $20.6718 per ounce, is an economic eccentricity; yet, when it is realized that this price was arbitrarily established by England in 1812 without regard to the cost of production, it does not seem so unreasonable, with the present inflation of commodity-prices, that this condition should exist. In fact the price of 85 shillings per ounce for gold, paid by England, in 1812 was above the market-price at that time. While it cannot be foreseen that commodity-prices will return to pre-war levels after the War, the present disparity between the cost of producing gold and its monetary price is probably temporary; therefore, a temporary expedient for the relief of this condition may be considered.

GOLD IMPORTS AND EXPORTS, UNITED STATES, 1914-'18. During the fiscal year 1913-'14, ended June 30, 1914, the United States exported $45,499,870 in gold coin and bullion more than was received by importation. In the next fiscal year the importation of gold exceeded the amount exported by $25,344,607. Had it not been for the fact that England promptly mobilized American securities held in England and used them in part settlement of her trade-balance with the United States the flow of gold in large volume into this country would have commenced sooner. Not until the second year of the War, that is, 1915-'16, did the effect of the liquidation of

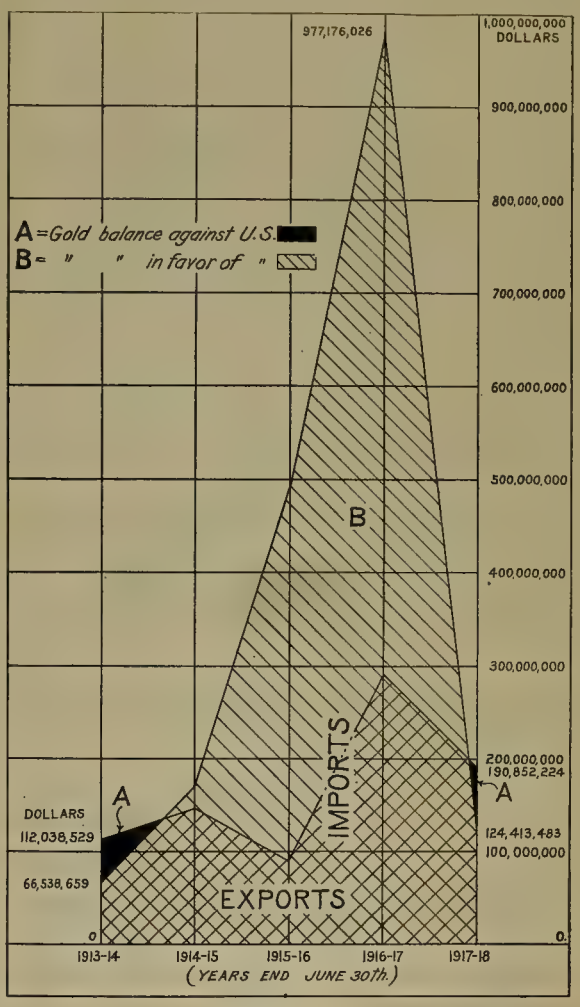


CHART NO. 1

GOLD IMPORTS AND EXPORTS OF THE UNITED STATES. FISCAL YEARS 1914–'18. DATA FOR CHART No. 1

Years end June 30	Exports	Imports	Gold balance against U. S.	Gold balance in favor U. S.	Excess imports over exports
1913-'14	$112,038,529	$66,538,659	$45,499,870	.....	−40.6%
1914-'15	146,224,148	171,568,755	.....	$25,344,607	+17.3%
1915-'16	90,249,548	494,009,301	.....	403,759,753	+447.3%
1916-'17	291,921,225	977,176,026	.....	685,254,801	+234.7%
Total three war years—					
1914-'17	$528,394,921	$1,642,754,082	.....	$1,114,359,161	+210.9%
1917-'18	190,852,224	124,413,483	$66,438,741	.....	−34.8%
Total four war years—					
1914-'18	$719,247,145	$1,767,167,565	$66,438,741	$1,047,920,420	+145.7%

United States gold reserve (gold coin and bullion) in the Treasury on June 29, 1918, was $2,478,221,424, of which $1,047,920,420, or 42.3% represents the gold balance in favor of the United States for the four war years, ending June 29, 1918. The statistics for 1914-'17 are from official records of the Department of Commerce; those for 1918 are reported by the Director of the Mint. The compilations and computations were made by H. N. Lawrie.

securities give way to substantial payment in gold, and consequently for that year the gold balance in favor of the United States amounted to $403,759,753. The third year of the War, 1916-'17, brought to our Treasury total gold imports of $977,176,026, being $685,254,801 in excess of the exports of gold for that year. In addition to maintaining forces abroad, the United States, upon joining the Allies, assumed immediately a large share of their financial responsibility, as is shown by the fact that in the year ended June 30, 1918, $66,438,741 in gold coin and bullion in excess of the gold imports was shipped out of the country to apply on trade-balances in foreign countries. To offset this drain upon the gold-reserve the importance of maintaining the pre-war output of new gold becomes apparent.

On June 29, 1918, the total gold-reserve in the United States Treasury amounted to $2,478,221,424. The gold balance against the United States for the year ended June 30, 1918, represents a loss to the gold-reserve of 2.7%. The total gold-balance in favor of the Treasury, namely, $1,047,920,420, which had accumulated in the four war-years, is 42.3% of the total gold-reserve on June 29, 1918.

It is estimated by Hennen Jennings that in December 1917 the total gold-reserve of the world was $10,000,000,000. This would have liquidated 35% of the total pre-war indebtedness of the combined belligerent nations, estimated at $28,290,000,000. The war-debt of all the belligerents has increased that indebtedness by $98,654,000,000, which makes the total indebtedness to December 1917, $127,944,000,000. In December 1917, therefore, the gold-reserve of the world would have paid but 8% of the debt of the combined belligerents, or a ratio of $1 in gold-reserve to $12.5 of indebtedness. On June 30, 1918, the total indebtedness of the United States amounted roughly to $12,500,000,000, and the gold-reserve bore a ratio to this indebtedness of approximately 1 to 5. The total indebtedness of the United States will approach $30,000,000,000 at the close of the fiscal year ending June 30, 1919,

Of the total production of the world for the above six years, Great Britain contributed 63.4%, the United States 20.3%, and all other countries 16.3%.

For the year 1913 the Allies produced 91.3% of the gold of the world, the neutrals 8.1%, and the Central Powers 0.6%. (Computed by Hennen Jennings).

and the ratio between the gold-reserve and this indebtedness will be approximately as 1 to 12.5. It will be seen, from this comparison, that the United States is 18 months in the lead of the world in maintaining its ratio of gold-reserve with respect to the superimposed debt. This fact to a large extent pre-determines the position of the United States as the world's banker. It is important to realize that, when the United States exported for the past fiscal year roughly $66,500,000 in gold more than was imported, this quantity on June 30, 1919, will have a carrying capacity of 12½ times that amount in terms of the superstructure of credit, which expands to a total of $830,000,000. At this same ratio the normal production of $100,000,000 of new gold in the United States would sustain a super-structure of credit of $1,250,000,000 or an amount more than 80% of the total value of the cotton crop in the United States in 1917.

As the prospector, in time of financial distress, returns to a favored spot in the hills with the knowledge that he can make wages by crushing high-grade gold-quartz in a mortar, or by panning rich gravel, so the Nation must adopt a policy that will encourage exploration for new ore-reserves in the properties already equipped with mills and that will make prospecting attractive in new fields. Whether gold be in the Mint or blocked in the operating mines is merely a difference of position and of the small time-factor of mining and milling the ore. With the United States in the enviable position of being the world's banker, with each day adding new burdens to the gold-reserve, the time has come to estimate the gold-reserve contained in ore blocked in operating quartz and placer mines and to provide the economic conditions that will favor an extension of such tangible reserves. The day may soon come, if it has not already arrived, when gold in the proved ore-reserves of operating mines will be considered as much a national asset by our Government and financiers as the gold-reserve in the Treasury. To prepare for adequate reserves is to introduce a factor of safety that will protect not only the gold standard, but will expand the base of liquidating gold upon which will inevitably be erected a large credit for the period of reconstruction after the War has ended.

Gold Production of the World, 1912-'17. The year 1915 marked the high point in the world's gold production. Of the total of $468,725,000, Great Britain contributed 63, the United States 22, and the remaining nations combined 15%. The total British gold-production for 1915 was $298,824,000, of which the South

*By difference.

Of the total gold production of the United States for the six years, 1912-'17, the seven States listed have contributed 90%, the remainder coming from all other States and dependencies of the United States. The statistics for 1912-'17 are from the official records of the U. S. Geological Survey. The percentage increase or decrease is computed from year to year. The compilation and computation was made by H. N. Lawrie. The estimates for 1918 are based upon estimates of the U. S. G. S. for six months ending June 30, 1918. Increases in Arizona and Montana offset losses in Utah, Idaho, and New Mexico.

African production of $188,035,000 constituted 63%, the Australian production of $48,988,000 17%, while the remaining 20% is made up chiefly of gold from Canada, Rhodesia, and British India. It will be noted that the relative importance of South African gold to the total British output of 1915 is the same as that of the total British gold output to that of the world, and, further, that the quota of gold from South Africa is practically double that from the United States. The gold output of the world for 1916 declined from that of 1915 2.5%; that of the British Empire 1.6%; while that of the United States was 8.3%. Had it not been for the more rapid falling off of the output from Australia the gains made in South Africa, Canada, and Rhodesia would have increased rather than decreased the total British output for 1916. Of the total decline of $11,725,000 in the world's output for 1916, the loss in production in the United States accounts for about $8,500,000, or 72%. It is evident not only that the economic pressure has been a greater factor in causing a more rapid decline in the gold output in the United States than in the British Empire, but that it began to operate sooner here than elsewhere. As further proof of this the world's decline in the gold output for 1917 amounts to 9.4%, that of the United States to 8.8, and that of the British possessions to 6.5%. Of the total decline of about $55,000,000 in the world's production for the two years 1916 and 1917, the reduction in the United States of $16,500,000 accounts for 30%. While the South African fields increased their gold-yield in 1916, an estimated loss of about $6,300,000 for 1917 indicates that the economic pressure had begun to operate there, remote as it is from the vortex of war. The very isolation of the South African fields and its distance from the centre of supplies probably necessitated laying in stores for a considerable period in advance of their need, and not until these had been consumed would the pressure of war-prices be so seriously felt. Again, the need of the mother country to augment its man-power did not fall so heavily on the ranks of labor in South Africa as in Canada and Australia.

Judging from the progressive decline in the Australian gold output, from $54,500,000 in 1912 to $35,300,000 in 1917, there is little doubt that the known gold-reserves of that country are becoming depleted, and that there has been a lack of new discoveries. From 1912 to 1916 the Canadian gold output increased continuously. The production in 1917 fell considerably, owing to the excessive drain on their man-power, and for practically the same economic reasons as have operated in the United States to cause their rapid decline, but Great Britain may look for an increase in the gold output from Canada after the War. The gold production of Rhodesia has closely paralleled that of the Canadian production from 1912 to 1916, and a decline of $2,280,000 from the production for 1916, being equivalent to 11.8%, indicates her response to the existing economic pressure. Rhodesia

Dec. 1918	6,000	8.00	2,400	12.00	72,000	−24,000	30.00	−10.00

The above data represent a type example of a medium-grade gold-quartz mine. It takes into consideration the economic factors over this period of time. The whole numbers are used to simplify the presentation, and the price of $20 for the gold-ounce also simplifies the calculations. Many properties in 1914, working on a narrow margin of profit, were forced to enlarge their scale of operations as did this one. At this time wages were reasonable, prices for supplies had not passed the economic limit, and these facts combined account largely for the increase in the gold-output of the United States which was recorded in 1915. The compilations and computations were made by H. N. Lawrie.

probably will contribute an increasing amount of gold as conditions revert toward the normal. British India has maintained a constant level of production for the years 1912-16, with a small decline in 1917, which would indicate her inability to enlarge the world's output in the future.

If the United States can put into effect measures for relief sufficient to weather the present crisis, which threatens to close many properties, some of which will be totally lost on account of the excessive cost of reopening, the pre-war yearly output of $90,000,000 to $100,000,000 of new gold may be relied upon.

Russia offers the largest opportunity, especially in Siberia, for a substantial development after the War, which will aid in maintaining the normal gold output of the world.

Mexico's decrease in gold production from $24,500,000 in 1912 to $6,500,000 in 1915, the year in which the pinnacle of the world's production was recorded, is a tragic evidence of the rapid economic decline into which a nation can fall when law and order are replaced by repudiation and murder.

With the resumption of normal conditions the possibilities of maintaining the gold output of the world on a pre-war basis are not discouraging. It is noteworthy that the British and the United States gains in production for 1915 were sufficient to produce the high point in the world's gold output in spite of the fact that the combined quota from the remaining countries suffered a loss that year of about $15,000,000.

GOLD PRODUCTION OF THE UNITED STATES, 1912-1918. It has already been shown that the economic pressure on gold mining in the United States was more severe than elsewhere in the world, and forced an earlier decline in production. The decrease was $16,500,000 in the two years 1916 and 1917, and, based upon estimates for the first six months of 1918, a further decline of $11,000,000 is assured for this year, with indications that a more rapid decline will ensue in the last six months of 1918, unless immediate relief is accorded the industry.

Of the total gold output of the United States in 1915 of $101,035,700, California produced 22.3%, Colorado 22.3, Alaska 16.5, Nevada 11.7, South Dakota 7.3, Arizona 4.5, and Montana 4.9. These six States and the Territory of Alaska produced 89.5% of the total gold output for 1915. The remaining 10.5% came from other States and dependencies. California and Colorado together contributed 44.6%, and, including Alaska, the proportion of the total output is raised to 61.1%. In round numbers the decline in the gold output of the United States for 1916 amounted to $8,700,000 or 8.3% of the total for 1915, of which 80% is due to the decline in Colorado and Nevada, these being about $3,500,000 each. The major part of the gold production of those States is derived from lode-mining, where labor is a more important factor in the cost than in placer mining. The ores are mostly complex, and require smelting or other special treatment, which makes additional labor necessary and adds the cost of high-priced fuel and chemicals. For these reasons the economic pressure was felt in Colorado and Nevada more quickly than elsewhere, and the first effect was to curtail exploration, which automatically diminished the production. Further proof is afforded by the continuous decline in the gold output of Colorado and of Nevada for 1917. The total yield in gold for the United States was roughly $84,500,000 in 1917, a reduction over that for 1916 of about $8,000,000,

GOLD PRODUCTION OF THE UNITED STATES

or 8.8%. The combined losses of Colorado and Nevada for 1917, $4,500,000, account for 56% of the total decline, while the notable falling off in the gold output of

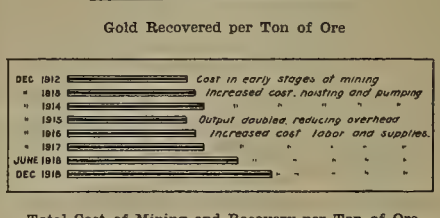
Gold Recovered per Ton of Ore



Total Cost of Mining and Recovery per Ton of Ore

California ($1,300,000), Alaska ($1,000,000), Montana ($800,000), and over $1,000,000 from all other sources, not including Arizona, indicates that the increased cost of operating extended in that year to the districts enjoying the most favorable operating conditions.

It is not surprising, therefore, that the estimates of the U. S. Geological Survey for the gold production in 1918, based upon the six months ending June 30, 1918, assume a decrease in the gold output of California of approximately $3,000,000, of Colorado $2,500,000, of Alaska $4,000,000, of Nevada $1,000,000, and of South Dakota and Oregon $300,000 each. While Colorado is still the centre of extreme economic pressure, the decline has been so general throughout the chief producing areas as to threaten the existence of the gold-mining industry. The estimated decrease in the gold output for 1918, based upon the first six months of operation, is certainly conservative, for there are many large producers about to close unless immediate relief is given. This will cause a more rapid decline during the last six months in 1918. The decrease this year is more likely to be as much as $15,000,000 or $20,000,000, reducing the total production for the year to $65,000,000, representing a total loss of 35% from the 1915 production of $101,000,000. In order to check the further and more rapid decline of gold production, ample labor will have to be provided, not only for the work of mining, smelting, and milling, but for increasing the amount of development, which has been neglected in the past three years.

THE INFLUENCE OF THE WAR ON THE COST OF PRODUCING DOMESTIC GOLD. In presenting the type-example to show the influence of the War on the operation of a mine containing ore of medium grade it is not intended to represent the maximum effect of the economic pressure. It is apparent that the lower-grade ores, which require from 10 to 20 tons to produce an ounce of gold, would have reached their economic limit of production earlier than the one which has been selected for the example, and that the cost per ounce from these lower-grade ores would now be higher than that in the case cited. The amount of gold contained in the ton of ore mined and milled in December 1913 declined from the recovery per ton in December 1912, 8.5%, while the cost of mining increased 7.1%, and the corresponding cost of producing the gold ounce increased 16.3%. In December 1914, the gold recovered per ton fell 9.1%, the cost of mining increased 6.7%, and the cost of producing the gold ounce 18%. It became apparent that the steadily diminishing value of the ore, in this example, coupled with the increased cost of mining, would force the closure of the mine early in 1915, so the tonnage was doubled in order to reduce the cost of production. The diminishing value of the ore as depth is gained on the deposit is not unusual, and must be taken into account in estimating the economic strain on the industry, although it is not in itself a component of the economic pressure that is accountable for the recent curtailment in output. In the same way the cost of mining and pumping increases with the depth at which the ore is removed from the mine. This would be true with steady conditions of labor and commodity-prices. However, the economic pressure that began to be felt by the industry in 1916 has gradually augmented the cost until in many instances it has become prohibitive and the mine shut-down. The management of the property taken as an example doubled the output of the mill, bringing it to six thousand tons per month in 1915. The ton-value of the gold recovered in December 1915 showed a further decline of 10%, but the operating costs, in response to the doubled capacity, were reduced 12.5% and the cost of producing the gold ounce was decreased 2.5%. For December 1916 a further reduction of 5.6% in the gold recovered per ton of ore, coupled with an increased operating cost of 7.2%, advanced the cost of producing the gold ounce 12.8%. In December 1917 the gold recovered remained the same as in 1916, and the additional cost of operation of 6.7% caused a corresponding increase in the cost of producing the gold ounce of 6.7%. In June 1918 the gold recovered dropped 5.9%, the cost of operation increased 25%, in consequence of the rise in wages and commodity-prices, which combined to increase the cost of producing the gold ounce 33%. The record for December 1918 has been assumed to show no decline in the gold recovered per ton, but with an increase in the operating cost of 20%, which results in a corresponding increase of 20% in the cost of the gold ounce.

The point at which the operation of this mine would have been making neither gain nor loss, that is, when the cost of producing the ounce would have equalled its monetary price, would have been in the early part of 1918, at which time the management would have shut the property down, or sustained a loss in future operation. If the owner continued to operate until June 1918 his loss would have been $5, and if continued to December, $10 per ounce of gold produced.

Many properties not so fortunate as this one in having so rich an ore were forced to close during 1916 and 1917. There are others, stronger financially, that are now operating at a loss in order to hold their organization together and to save the ultimate extra cost of re-opening when normal economic conditions may be resumed after the War. This policy is followed in the belief that the Government needs the gold, and will aid the industry.

There is but one way to cope with this condition in order to prevent the practical extinction of the gold industry and that is to treat the matter as a war emergency and to establish an economic equilibrium for the gold miner. Some direct method of compensating for the increased cost of producing the new gold should be adopted, without disturbing the monetary standard. It is for the Government to decide upon the nature, extent, and manner of the relief necessary. It is the duty of the gold producer to make known to the Government the present cost per ounce of producing the new gold as fundamental to effective action. To ensure the maintenance of the gold output now will safeguard the gold standard through the crisis of war; it will secure for the Allies a favorable adjustment of indemnities with the Central Powers; it will constitute a superior basis for the credit-structure necessary for the work of re-construction after the War; and finally it will serve as a most effective means of regulating the economic regeneration of the Central Powers.

Federal Taxation and Finance of Mines

By J. F. CALLBREATH

*One provision of the present income-tax law that has worked much injustice to small companies and possibly has caused the Government to lose much larger sums, which over-capitalized companies have escaped, is Section 326 of the proposed Act, subdivision "a", subsection 2, containing the following language: "But in no case to exceed the par value of the original stock or shares specifically issued therefor."

To limit 'invested capital' to the par value of the stock taken in exchange for property at the time of its acquisition is peculiarly unjust to the smaller mining companies which, in most cases, are organized to own a single mine after its promoters have spent large sums in prospecting and developing. These owners in many instances have acquired and developed a large number of worthless properties before the mine became productive and have expended large sums of money to put it on a paying basis, not by sitting and watching it grow, but by the expenditure of large amounts of money, labor, and energy. By this means it has increased in value and should in justice be permitted to utilize this increased value in determining its invested capital. Under this part of the section, a company which issues stock conservatively in an amount less than the real value of the property, would be limited to such amount, even though the property had an actual value far in excess of the face-value of the stock, while a corporation that was grossly over-capitalized at the time of the purchase of its property for stock would get the benefit of the increased value of the property up to the par value of the stock issued. This inequity is cured where stock is issued with no par value (Sec. 325, paragraph B, page 61), but where the fiction of a corporation is issued as a convenient means for dividing the interest of business associates, and a share of stock represents a certain interest in the property of the corporation entirely uninfluenced by its face value, it seems evident that this limiting clause can but work injustice.

A specific instance will illustrate: A few years ago the executor of a New York estate, in order to divide among the heirs a mining property that could not then be properly liquidated, organized a corporation with a capital stock of $10,000, to which the mining property was transferred, and he divided the shares in the proper proportions among the heirs. In the year 1916 that corporation paid taxes on a valuation of $2,700,000. Under a strict construction of the present Revenue Law, and under the proposed law, the invested capital of this company, upon which it could make deduction, is limited to $10,000, while its actual invested capital is $2,700,000. Under the proposed law this company is liable to pay 8% on $2,690,000, or $215,200 more than it would have been required to pay had its capital stock been fixed at the fair value of its property.

It is understood that the Revenue Department, recognizing this injustice, has in some instances permitted this excess value to be treated as 'paid in or earned surplus', and by this device has avoided the unjust technical requirement of the law.

It would seem, in view of the large latitude of authority given to the Treasury Department, it should be intrusted with power to fix the value of the property of an under-capitalized corporation. The strict application of this provision is likely to work an equal injustice to the Government. Let us assume that a mining company had invested $500,000 in a property, and that 75% of its reserve had been worked out prior to January 1, 1917, so that during the taxable year the company had but 25% of its original investment involved. During the year 1917 this company might have made an unusual profit, but under the provision referred to, it would be permitted to deduct 8% of the $500,000 originally invested instead of 8% upon the $125,000 actually invested. It seems proper also to suggest that settlements made by the Treasury Department in good faith, and where all the facts have been presented by the taxpayer, should be considered as final. It seems but fair to business interests, after meeting all the requirements, to know that the matters are finally determined.

Much inequity has resulted from the custom of the Revenue Department in valuing orebodies at the purchase price "at the time of such payment", as required in Section 326, line 10, page 61. The result is to fix different values upon property in all respects absolutely equal in value. Companies A and B own adjoining sections of land of equal but nominal value for which they respectively paid $10 per acre. Each at an expense of $100,000 develop ore, oil, or coal, worth $1,000,000. Company B sells his holdings to Company C for $1,000,000. Company A is entitled to a deduction of 8% on the cost of the land ($6400) and the cost of improvements ($100,000) making a total of $106,400. Company C is entitled to a deduction on the cost of the property of $1,000,000. This is only an illustration, but inequities of this sort will be found in many, if not in all, districts. This grows out of the proposal that an orebody is worth just what it costs without regard to the losses in development of worthless properties, without regard to the hazardous nature of mine development, and without regard to the actual value of the property. It is fair to say that there will be few gamblers at the table where most men lose

*Portion of statement made to the Committee on Finance of the U. S. Senate, Sept. 11, 1918.

and where the winner is immediately divested of the rewards of his lucky chance; in other words, that the development of new mining properties will not be made except the successful operator is allowed a reward proportionate to the hazard involved in his enterprise.

It would seem that a distinction must be made in assessing a tax upon the earnings of an exceedingly short-lived enterprise, as compared with enterprises of longer life or those that are permanent in their nature. A bill recently passed by the House of Representatives (H. R. 11,259), known as the War Minerals Bill, had for its purpose the stimulation of production of certain minerals necessary in war-work, which heretofore have been imported from foreign countries and of which there is now a shortage. We have been importing above two million tons of manganese, chrome, and pyrite respectively, from Brazil, New Caledonia, and Spain. These minerals are absolutely essential in the manufacture of steel and explosives. The fact that the supply of these minerals had heretofore come almost entirely from foreign countries, affords proof that these industries probably cannot thrive at home under normal conditions unless protected by compensating import duties. No one can predict what the tariff policy of the United States will be after the War. In consequence no one is justified in expending a large sum of money for the development of a mine, or the construction of a treatment-plant in order to supply a temporary market. If the demand for these minerals shall be terminated in two years, then it is plain that a plant now erected must amortize the original investment during these two years, in addition to earning the ordinary profit. The deductions for depreciation cannot be made to meet the situation because at the end of the two years a plant might be at least 80% efficient, in which case a 20% deduction for depreciation for the two years would be fair, but the remainder would be entirely worthless unless the market conditions justified continued operation. I do not feel justified in suggesting that these enterprises be exempted from war-taxes, but I do urge that full authority be given and that this revenue law shall anticipate that deductions for depreciation of plants engaged in short-lived enterprises shall be sufficient to amortize the cost of construction and development during the working-period of the enterprise. Operations developed for the purpose of supplying these rare minerals, which are needed for war-purposes, can be more nearly compared to the housing facilities and plants constructed for war-purposes by the Government. At the conclusion of the War they will be practically valueless. The same principle applies to short-lived mining operations, whether terminated by want of a market or by the exhaustion of the orebodies.

Gold mining is the one business that is burdened by prosperity in other lines. If financial systems could be so arranged that gold were not the basis of credit, the production of gold would become a matter of small concern to the public. As long, however, as gold is the basis of our currency, it is essential that the proper ratio between credit-money and gold shall be maintained in order that our credit at home and abroad may be preserved. At the present time gold production throughout the world is falling off at a rapid pace. With the exception of a few high-grade mines, the production of gold, except in association with other minerals, is rapidly coming to a standstill. The cost of gold mining in the Western States has increased fully 60% during the last three years; the value of the product remains the same. The gold production of the United States during the last three years is as follows:

1915	$101,035,700
1916	92,316,100
1917	83,750,440

This shows a falling off approximately of 10% annually. The decrease during the present year will greatly exceed the ratio of the past three years. The great low-grade gold-producing mines of the country must close unless some special aid be given. This condition of the low-grade gold mines will not be affected by the new Revenue Act because these mines have no profits to tax. Gold, however, must command serious attention. A foundation sufficient to sustain a certain structure of credit may be found entirely unable to sustain a vastly increased credit. The United States is more fortunate than any other nation in the world in having the larger share of the world's gold-reserves. It will need to guard that reserve with intelligent foresight. In the enactment of a revenue law providing for the collection of a tax amounting to 80% of the total gold in the world, and two and one-half times our own gold-reserve, every precaution must be observed to maintain the replenishing stream of gold from new production. Some advocate that gold mining be exempted from the excess and war-profit taxes. I would urge you rather to assist the gold-mining industry that it shall be able to pay taxes. If the Senate Finance Committee cannot see its way clear to give serious consideration to legislation of this character, then I believe that gold mining should be exempted from the requirements of this bill. High-grade bodies of gold ore are not numerous, and are usually developed as the result of great expenditure and long and tedious operation. It is then exhausted in a short time. An orebody which has been sought for ten years and which may be exhausted in one, is a losing proposition if the production takes place at a time when the Government demands 80% of the net operating revenue as a tax. If that production had been scattered through the ten years of development work, there could be no objection to making the company bear its full share of the tax, but when the returns of ten years' effort are charged only with the expenses of one year, the injustice is self-evident. I predict that, before many years, not only this country but other countries will find it expedient to provide special inducements for the production of gold from low-grade deposits in order that a stable foundation may be provided for the rapidly expanding credits necessary in our commercial life. A million dollars in gold taken from the ground forms a reasonably stable basis for eight million dollars of national currency.

RENO, NEVADA

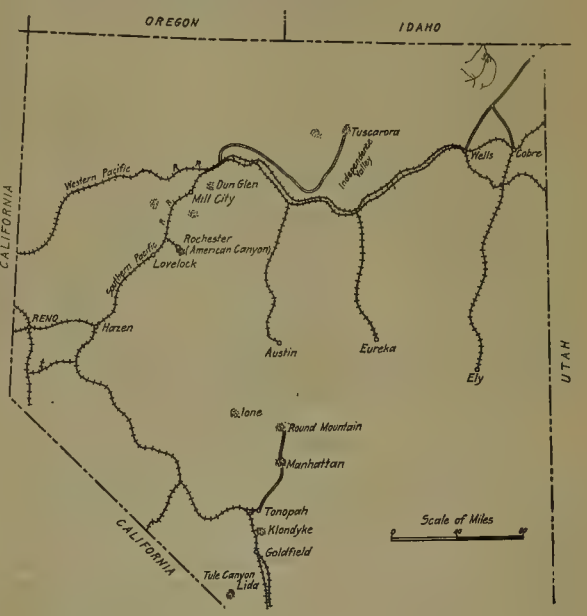
Exemption for Miners.—Carson Mint.—Amalgam in Carson River.—Placer Mining Possibilities.—Cyanidation Replaces Flotation.—Wall Street Mine.

The first claim for exemption of men engaged in essential industry in Nevada is being made to the district exemption board and to local draft boards by the U. S. Smelting, Refining & Mining Co. It asserts that it is engaged in an essential industry, and if the supply of silicious ores from Nevadan mines were to be interrupted it would become necessary to close down the company's plant in Utah. Similar claims for exemption of miners will be made by a number of mining companies.

Ray T. Baker, director of the Mint, who was to have attended a meeting of mint superintendents at Carson on October 15, has been ill at his Lenox, Massachusetts, home; but is said to have started for Nevada, so the postponed meeting will be held within the next few days. It is said that the subject of re-opening the Carson mint for the coinage of silver will receive serious consideration.

Further tests on the treatment of amalgam and concentrate taken from the bed of the Carson river, below the old mills that treated by pan-amalgamation the product of the Comstock bonanzas, have been conducted at the Mackay School of Mines. Interesting results have been obtained, especially in connection with the saving of 'floured' quicksilver, which was thought to have been carried away by the water. These tests not only have indicated the presence of a large quantity of the floured mercury, it is said, but afford promise of a high recovery by washing over tables. In all tests for saving the amalgam and fine material, primitive methods of sluicing and washing have achieved the best results. There is no lack of water in the river for large-scale operations; on the contrary, work is hindered at times by an excessive flow during storms, and it may become necessary to construct diverting-dams above the point of operation.

Placer mining is now attracting more interest in Nevada than for many years. A dozen or more districts in the State yielded placer gold in the early-day operations, conducted in many instances by Chinese miners; but the lack of water has long been supposed to preclude successful placer mining. The only important operation of this character in late years has been that of the Round Mountain Mining Co., in northern Nye county. In recent months, Goldfield men have been prospecting the bed and tributary gulches of Tule canyon, an off-shoot of Death Valley, in southern Esmeralda county; and have found rich gravel above shallow bedrock at many points for a distance of five miles along the bed of the canyon. Several districts in Humboldt county produced placer gold in large quantity, including American canyon, near the present town of Rochester; Rabbit Hole basin, 30 miles north of Lovelock; Horse Creek canyon, at the northern extremity of the county; Dry canyon and Spring valley, south of Mill City; Barber canyon and Dun glen, east of Mill City. It is said Wells Fargo & Co.'s receipts show that Chinese miners shipped $12,000,000 in gold from Barber canyon in eight years. In Elko county, the Tuscarora district, on the border of Independence valley, and the Bull Run placers, farther north, sent out quantities of gold. Rich gravel has been found in the region drained by the Little Salmon river, in the far northern part of Elko county, and in Squaw valley, west of Tuscarora. Nye county, in addition to the Round Mountain placers, contains ground that was worked profitably many years ago and within recent months gold was being taken from placers near Ione and in Golden canyon, near Smokey valley. In Lander county, the Copper canyon placer mine



MAP OF NEVADA, SHOWING GOLD PLACER AREAS.

is now being worked successfully, and a placer boom some three years ago resulted in founding the camp of Bannock, now nearly deserted. Esmeralda county has many promising fields for placer mining in addition to the Tule Canyon region. Chinese and white miners produced gold from placers at Klondyke, midway between Goldfield and Tonopah, some 40 years ago, and their workings are still to be seen. Good nuggets, one valued at $1200, have been found here in late years. Gold Mountain, Fish Lake valley, and the Lida districts are said to contain placer ground of great value. Of course, the Manhattan gravels must not be forgotten. Dry washing has been successful only under certain favorable conditions, but nowhere in Nevada has the problem of recovering placer gold been attacked seriously or with equipment other than that available to the prospector.

Mill City is growing busier as a result of tungsten mining near by. If placer mining is revived it should still grow. There is said to be manganese in a canyon not far away.

The flotation mill of the Jefferson Gold & Silver Mining Co., as mentioned before in these letters, operating at the old Kanrohat mine in Jefferson canyon, near Round Mountain, will be partly dismantled in order to revert to cyanida-

tion again. The ore is oxidized and recovery by flotation was not satisfactory. It will be necessary to pipe the waste solution and tailing out of the canyon, a distance of nearly three miles, to avoid damage to the Round Mountain water-supply and to avert danger of poisoning cattle. The manager, S. H. Brady, says that development in four tunnels is opening a large tonnage of high-grade milling ore.——The Louisiana Consolidated Mining Co. is said to have closed down its mine and mill. It was announced some time ago that Samuel Newhouse of Utah had become president and controlling factor, succeeding Walter Trent, who has entered the Army.

Tests have been conducted for some time at a small plant near Los Angeles to devise some method of treating ore from the Jumbo Copper Mountain Mining Co. The mine has been opened to a depth of 385 ft. Most of the ore above that depth is oxidized, the deeper workings have entered the sulphide zone. While the tests are not conclusive, and the plant may be enlarged to secure more dependable results, it is shown that the sulphide ore will yield a 92% recovery by flotation. The latest tests indicate that leaching in a salt solution, under agitation, will yield 92% of the copper content of the carbonate ore. The tests include treatment of the flotation concentrate.

The Wall Street mine near Luning, in Mineral county, has been shipping 7% copper ore at the rate of 700 tons monthly. The ore also contains 3 oz. of silver per ton. It is shipped to the Hazen sampler of the Western Ore Purchasing Co., thence to smelters in Utah. The manager, J. B. Kendall, formerly mine superintendent for the Goldfield Consolidated, reports 40,000 tons of low-grade ore used as stope-filling and 12,000 tons on dumps. He says that this ore assays 3% copper, 3 oz. silver, 20% iron, 19% lime, and 45% insoluble. The Wall Street mine is owned by A. H. Howe, secretary and treasurer of the Goldfield Consolidated, and Charles R. Evans, democratic nominee for Congress. The mine has been producing ore of shipping grade for the past three years.

MAYER, ARIZONA

Recent Development of the Copper Properties.

The Little Egypt copper property, which is situated a half-mile east of Mayer, has been financed by W. A. Davidson of Prescott. The mine was owned by Charles S. Vivian, of Humboldt, and William Beldford, of Mayer. A steam hoist has been erected at an old shaft which is to be sunk 600 ft. Shipments of ore are to be made to the Humboldt smelter from surface workings. A. L. Blumenauer of Jerome will be mine superintendent.

The Swastika silver mine has been taken over by the Consolidated Arizona Smelter Co. The property has been worked under lease by F. W. Giroux, who shipped 50 cars of high-grade ore. Claude Ferguson, formerly superintendent of the Copper Queen at Stoddard, has been retained as mine superintendent of both the DeSoto and Swastika mines. The Swastika is sending three cars per week to the smelter at Humboldt. Development is expected to explore a large territory of silver ore.

The Arizona Binghampton company has decided to sink 1200 ft.. and enlarge the flotation mill. Over 31,000 lb. of copper was produced during the first six days of October. About 30 tons of concentrate is produced daily from 170 tons of ore.

The Big Bug Copper Co. has commenced sinking on a promising outcrop in the Copper Mountain district. A gasoline hoist was recently moved from another property owned by the company to this shaft. At a depth of 60 ft. there is 15% showing.

Development in the Kay mine during the past 30 days shows a drift 140 ft. on the 500-ft. level in ore averaging 15% copper and $3 gold; a cross-cut driven east 75 ft., all in ore running from 1½ to 5% copper with some gold and silver; and a cross-cut 70 ft. from the main shaft in 20 ft. of 18% copper ore. Extensions are to be made. This mine is attracting a great deal of interest locally on account of the size of the orebodies and the uniform metal content. George W. Long, president of the company, has moved from Oatman to Phoenix. He is at present in New York conferring with the shareholders. A large flotation plant is contemplated. The ore is chalcopyrite. The Kay mine is located about 25 miles south of Mayer.

The shaft at the Pentland mine is down 650 ft. A cross-cut 12 ft. west at the 600-ft. level cut the orebody, which, at the 500-ft. level, was 14 ft. wide, averaging 4% copper. The shaft is to be continued to the 1000-ft. level.

CRIPPLE CREEK, COLORADO

General Notes from the District.—Drainage-Tunnel Operations.

The Vindicator Consolidated will resume payment of quarterly dividends on October 25. No. 81, of 1c. per share, will amount to $15,000.

The Lincoln Mines & Reduction Co. has graded a site and is now laying foundations for a concentrating plant on the property of the Rex Gold M. & M. Co., on Ironclad hill, the scene of the recent manganese discovery. The first unit will have a daily capacity of 100 tons.

Production of the United Gold Mines in September, from lessees, totaled 1540 tons with a gross value of $25,000. The mines producing were the Trail on Bull hill and W. P. H. on Ironclad hill.

Production of the Acacia company in September totaled 200 tons of 1-oz. ore.

Work in the Roosevelt tunnel during September amounted to 566 ft., of which 322 ft. was in Portland ground on Battle mountain and 214 ft. in the property of the Cresson Consolidated on Raven hill. The drift from the tunnel-level reached its objective directly under the Cresson shaft on October 14. A raise has been started to connect with the sump 31 ft. above the tunnel-level.

COBALT, ONTARIO

Tailing Treatment.—Geologic Exploration Near the Contact.

The McKinley-Darragh-Savage company will close its 200-ton flotation plant during the winter, it being considered more economical to treat old tailing during the open season. The plant is expected to be closed early in December. The mill, however, will be kept in full operation.

A new development, one full of interest to property owners in the Bucke Township section of the Cobalt silver area, is the decision this week to sink a shaft to a depth of 300 ft. in ground recently purchased from the Nipissing Central Railway by the Mining Corporation. It lies on the west side of the railway at North Cobalt. In the keewatin formation, immediately above the underlying diabase, a series of veins have been cut in the Adanac mine. They range from mere stringers to 8 in. in width. They consist of calcite, in which cobalt and a little native silver is present. The zone of operation is similar to that wherein the larger portion of the big output of the adjoining Temiskaming mine was found. Driving along the veins is under way.

Kerr Lake company pays 25c. per share on December 16. This is equal to $150,000, and makes $600,000 for 1918, and $8,010,000 to date.

Nipissing produced silver worth $256,461 in September. This is still much lower than the average for the first 7 months of the year. The high-grade mill treated 98 tons of ore, and the low-grade 6348 tons. Including custom metal, the refinery shipped 513,713 ounces.

THE MINING SUMMARY

ALASKA

Bethel.—According to D. S. McAlpine, of the power-schooner 'Ruby,' who arrived at Seattle on the 15th, miners in the Kuskokwim River district are threatened with famine

SOUTH-WESTERN ALASKA, SHOWING KUSKOKWIM REGION.

before winter sets in. The 'Ruby' was the only vessel that went to this region this season.

Juneau.—October 18 was the 51st anniversary of the ownership of this Territory by the United States. In 1867 it was purchased from Russia for $7,200,000, since when the output of gold, copper, minerals, fish, and fur has been at least 100 times greater than the price paid.

Kennecott.—The Kennecott Copper Corporation produced 5,508,000 lb. in September. This is the highest return since April.

ARIZONA

Ajo.—New Cornelia produced 3,744,000 lb. of copper in September, 400,000 lb. below the year's average.

Bisbee.—Calumet & Arizona produced 4,868,000 lb. in September, the largest for the current year.

Clifton.—Arizona Copper produced 4,330,000 lb. in September, 30,000 lb. above August.

Crown King.—The Philadelphia Mining Co. has been formed to operate the Nelson gold mine here. A 1000-ft. tunnel is to be driven to cut the orebody at the 960-ft. level.

Globe.—Old Dominion produced 2,292,000 lb. of copper in September, 600,000 lb. below the average for 1918.

Arizona Commercial pays 50c. per share on October 31. This amounts to $87,500.

It is reported that the Iron Cap company has entered into a contract to obtain power from the Inspiration Consolidated company.

Construction has been commenced on the mine-rescue building of the Globe-Miami District First Aid and Mine-Rescue Association.

Kingman.—The McCracken Silver-Lead Mines Co. has intersected the vein, and 150 ft. of driving has opened a large quantity of $20 ore.

Miami.—The Miami Copper Co. pays $1 per share on November 15. This is equal to $747,114.

Inspiration Consolidated produced 7,800,000 lb. of copper in September, 700,000 lb. below the average for the year.

Oatman.—A. C. Werden, of the Gold Ore company, reports that work in the west drift continues to open ore which averages $20 per ton. Cross-cutting toward the shaft is to be commenced and preparations for stoping carried out.

It is reported that driving to the south on the seventh level of the United Eastern has opened ore for 30 ft. assaying over $20 per ton. The width of the vein is not yet known.

CALIFORNIA

San Francisco.—The following questionnaire has been sent to producers of chrome ore in the Pacific States. If any producer has failed to receive this questionnaire, he is requested to use the text of it as given herewith, and to send his replies without delay to the address specified:

As a producer of chrome ore you are requested to furnish answers to the following questions in order to assist the Pacific Coast Chrome Producers Association in its efforts to obtain protection for the industry. If you cannot promptly answer all the queries, kindly reply to as many as possible and return the questionnaire immediately. Additional data submitted, either with this questionnaire or later, will be appreciated. To secure results, haste is important. Mail your answers to Courtenay De Kalb, 420 Market street, San Francisco.

1. Name of your property.
2. Situation of your property:
   - (a) State.
   - (b) County.
   - (c) Post-office address.
   - (d) Shipping-point.
   - (e) Direction from shipping-point and distance.
3. Who is the owner or lessor of the mine?
4. When did you begin operating?
5. How many tons have you produced?
6. How many tons have you shipped?
7. How many tons have you mined?
8. Have you any ore remaining unsold? and how much?
   - (a) At shipping-point.
   - (b) At mine.
9. What grades of ore have you been shipping?
10. Have you contract for future delivery of ore?
11. How many tons contracted?
12. How many tons do you estimate that you have available but unmined?

13. Can you state probable grade of such tonnage?
14. If you have a concentrating-mill please state:
    (a) Daily capacity, tons of raw ore.
    (b) Concentrates produced, tons ...., grade .....
15. What have been your average costs per ton of ore at shipping-point?
16. How much money have you expended in road construction?
17. What have been your initial expenditures for buildings and equipment?
18. How large has been your total investment in the operation?
19. Would liquidation of your chrome business at this time involve a net loss? .... How much? ....
20. How large has been your total net return applicable to amortization of capital and of profit?
21. What led you to turn your attention to chrome production?
22. Do you believe that a fixed price for chrome ore should be established?
23. Can you make a profit on your operation at $1.25 per unit of Cr_2O_3 for 38% ore, as a base price for the schedule?

Amador.—The Central Eureka company's superintendent states that the winze is down 15 ft. below the 3500-ft. level, where there is from 10 to 13 ft. of quartz. Free gold is visible, and the average assay is $25 per ton. Other parts of the mine look well.

Garden Valley.—The Black Sand Gold Mines Co. of Garden Valley, Yuba county, has been given a permit by Commissioner of Corporations E. C. Bellows to sell four shares to its incorporators at par for cash and 999,996 shares to W. H. Simpson for the assignment to it by him of the option to purchase the Nevada placer mine, in Green Valley district.

Kennett.—The hoisting-plant of the Shasta King mine was burned on the 10th. The loss was $3000. The machinery was on the Balaklala tram-line, and was used to raise ore from the Shasta King to the tram for shipment by aerial tram to Coram, thence to Kennett. The damage will be made good within 10 days. In the meantime, ore extracted is stored in the mine. The Shasta King, a Trinity Copper Co. property, is operated by the Mammoth Copper Co. under lease and bond.

Lowrey.—The Noble Electric Steel Co. has closed its chrome mines for the winter. E. W. Bedford is superintendent. The property is several miles from this place.

Sutter Creek.—The Old Eureka shaft is down 2650 ft. Sinking continues at the rate of 125 ft. per month, the objective being a depth of 3150 ft. Some good ore is said to have been opened at 2150 ft., and is being followed.

Trinity Center.—The Big French Flat Mining Co. is to issue 4500 $1 shares to E. G. Gould and others. To clean-up the bed of Trinity river, it is proposed to divert the water through a tunnel in the bend at Big French flat.

Twelve hundred tons of machinery is arriving at Redding from the East, and is being transported by auto-truck to Trinity Center for the Estabrook Gold Dredging Co. This work cannot be completed before snow blocks the mountain roads.

COLORADO

Black Hawk.—Equipment of the Fifty Gold Mines Co. was bid for last month by Morse Bros. of Denver for $22,500. The bankruptcy court considered this not enough, as the sale must pay all indebtedness—$41,808—so E. Sabin, representing Eastern people, paid this amount. Morse Bros. objected, and were granted a stay of five days to formally file their reasons. The new owners are to re-open the properties at once.

Cripple Creek.—Cresson Consolidated made a profit of $104,650 during August. The regular monthly distribution of $122,000 was made last week. Fully developed ore-reserves were valued at $2,948,000 on September 1. Cash on the 30th was $1,040,691, plus ore in transit valued at $30,000. On No. 16 level, No. 49 diamond-drill hole cut 20 ft. of low-grade ore.

Manganese has been discovered on Ironclad hill. F. M. Van Tuyl, of the State School of Mines at Golden, has made an examination. The ore is found in a volcanic breccia to a depth of 100 ft. The deposit is 'spotted,' that is, occurs as small pockets, this rendering its persistence as uncertain.

Vindicator pays 1%, or 1c. per share on 1,500,000 shares, on October 25.

Leadville.—At a depth of 128 ft. in the new Huter shaft of the Matchless property on Fryer hill, high-grade iron-silver ore has been opened.

The Doty Manganese Co.'s shaft on Poverty flat is down 179 ft. on its way to 250 feet.

Good progress is being made in extending the Anderson tunnel in Prospect mountain. A silver-bearing vein was recently cut.

MICHIGAN

Houghton.—St. Mary's Mineral Land Co., which owns the Champion mine jointly with the Copper Range Co., distributes $160,000 on November 1. This is equal to $1 per share, making $5 for 1918. Also on November 15 there will be distributed 16/100 of a share of Mayflower-Old Colony and 36/100 of a share of Winona Copper Co. for each share of St. Mary held by holders of record on October 11. The St. Mary company is withdrawing from active participation in management of these other companies.

Copper production of Calumet & Hecla and subsidiaries during September was as follows:

Mine	September lb.	9 months lb.
Ahmeek	1,866,665	19,364,630
Allouez	510,000	5,545,853
Calumet & Hecla	4,964,872	51,538,796
Centennial	157,071	1,852,362
Isle Royale	1,185,643	11,061,998
La Salle	124,000	1,451,105
Osceola	1,153,217	12,297,843
Superior	120,000	1,391,856
White Pine	260,000	2,054,824

MISSOURI

Joplin.—Production of the Tri-State fields last week was 7426 tons of blende, 577 tons of calamine, and 1168 tons of lead. These averaged $54, $40, and $100 per ton, respectively. The total value was $545,650, of which Missouri yielded $86,861.

MONTANA

Butte.—Davis-Daly in September mined 3754 tons of ore, yielding 480,414 lb. of copper and 20,900 oz. of silver. Compared with August there was a drop of 220,000 pounds.

Saltese.—The Tarbox Mining Co., in charge of Richard Dixon, has 25 to 30 men at work. A cross-cut is being driven to the vein on the 1000-ft. level. The power reservoir has been improved, and one mile of 10 to 22-in. steel pipe has been ordered. This power will reduce mining and milling expenses by $1000 per month. An assessment of 10 mills per share has been levied. This will realize $20,000.

Troy.—The Snowstorm Mines Con. treated 4500 tons of ore in September. About 6000 is expected in October. Only 50 miners were employed last month, but 90 are there now. No. 7 tunnel is in 1000 ft. A motor-driven saw-mill has been erected.

NEVADA

Aurora.—The Aurora Consolidated, it is reported, will suspend operations at an early date. Under present conditions it is not profitable to mine the low-grade gold ore.

Las Vegas.—The manganese mine of T. Thorkildsen of Los Angeles, 17 miles from Las Vegas, is producing up to 200 tons per 24 hours. This quantity is to be doubled. Three shifts are employed. Seven White 5-ton auto-trucks and trailers and one 75-hp. Best tracklayer haul the ore to rail. One of the trucks is used for sprinkling and repairing the road. The trucks make four trips in 24 hours, delivering five tons each per trip; while the tracklayer delivers 40 tons, making one trip daily.

The State Railroad Commission at Carson has refused permission to the Las Vegas & Tonopah Railroad to discontinue operations. The company stated it was unable to operate at a profit and wished to tear-up its tracks. The Commission ruled that the road is a necessary link in the system extending from Canada to the Mexican border, that it is essential in rapid communications between northern and southern sections of Nevada, and that its passing would deprive Nye and Clark counties of taxable wealth. The Commission has made formal application to the U. S. Railroad Administration to take over and operate the line.

Rochester.—The Rochester Elda Fina Mining Co. brought suit against the Rochester Mines Co. for the sum of $1,056,000 in the District Court of Humboldt county on October 16, and levied attachments on the 17th on the bank-accounts, mining property, mill, and bullion of the defendant company. The suit is based on the plaintiff company's claim that the defendant has taken ore of that value belonging to the plaintiff, and will depend upon which company has the apex of the vein. Both companies claim to have the apex, and the dispute between them has been continuing for some years. The plaintiff bases the amount of its claim for damages on a figure of $15 per ton for the ore taken, it being said that rim samples return that amount as an average. The suit will not interfere with the working of the mine by Rochester Mines Co. L. A. Friedman is the controlling interest in that property, while Joseph F. Nenzel controls the Rochester Elda Fina Mining Company.

Tonopah.—Production last week totaled 8803 tons of ore valued at $149,651.

The Tonopah Mining Co. is fast cleaning-up its dumps. Its Millers plant treated 15,000 tons of this ore during September, yielding bullion worth $54,300. In 9 months the dumps have produced $468,000. From underground, daily shipments to the Belmont company's mill total 150 tons.

The West End produced $113,156 during September, making a total of over $1,000,000 in 9 months.

Bullion from the Belmont is worth about $1.20 per oz. The last clean-up for September yielded 88,460 oz. and 45 tons of concentrate. The latter is worth $500 per ton.

The Extension has its new pump at work in the Victor shaft.

The Halifax is raising from the 1400-ft. level to 1200 ft. to prospect an area of trachyte.

Production of some of the mines during September was as under:

Mine	Tons	Silver, oz.	Gold, oz.	Profit
Extension	8,379	94,392	898	$31,844
Tonopah Mining	14,350	113,700	1,122	45,910

The Mining company is experimenting on the tailing at its Millers plant, to see if it is worth re-treating.

The North Star company, A. E. Lowe in charge, reports that the drift under the Mizpah fault on the 900-ft. level has cut 3 ft. of good ore.

OKLAHOMA

Miami.—According to J. H. McNichols, another ore warehouse—50 by 500 ft.—is to be erected at Tar River. One of similar size will be put up at Douthat, where there are 44 producing mines. The one at Picher is expected to be ready by October 25.

Picher.—Production of the various districts last week totaled 6033 tons of blende and 977 tons of lead, valued at $424,150.

UTAH

American Fork.—The Belorophon mill is working steadily, but the Pacific mill has been closed temporarily, due to shortage of ore.

Garfield.—Sand-slides are said to have damaged the A. S. & R. smelter here to the amount of $75,000 or so, also tying-up work for a time in the crushing department.

Mammoth.—The Grand Central Mining Co. paid 4c. per share, equal to $24,000, on October 15. This makes $1,784,000 to date. Ore shipped in September amounted to 1350 tons.

CANADA

British Columbia

Atlin.—One of the best-known placer districts in British Columbia is Atlin, and probably there is no water-course better known to the local miners than Pine creek. The accompanying illustration shows part of the hydraulic workings of the Columbian Mines Co. This is of especial interest at present, because the holdings of this company, on account of high costs of labor and supplies, etc., and the low purchasing value of gold, were disposed of recently by the sheriff at a ridiculously low figure. The question of the company's title now threatens to become the subject of litigation in this Province.

C. E. Watson, the general manager of the Mining Corporation of Canada, and G. O. Randolph have gone to

HYDRAULICKING IN THE ATLIN DISTRICT, BRITISH COLUMBIA.

northern British Columbia. Their intention, according to well-authenticated reports, is to make a survey of the well-known Engineer gold mines of the Atlin district. The Engineer is at present controlled by Captain Alexander, who recovers considerable gold by means of a small stamp-mill. Several times the property has been under option for large sums.

This has been an exceptionally good season for water for hydraulicking in the Atlin region, but labor was very scarce, resulting in few of the creeks being worked to capacity. Generally speaking, the ground should yield an average output, but when profits are expected that is another matter. The high cost of supplies and the increase in wages, both past and prospective, will probably compel all to close down until conditions improve. There is only one company in this district that will make expenses this season, so it is little use in trying to operate under such conditions and exhaust the ground. The only relief is for the Government to give a bounty on the new gold produced, such bounty to offset the

increased cost of operating, which would amount to $8 or $9 per ounce.

Fernie.—After being on strike for 34 days the coal-miners at Crow's Nest Pass have returned to work. They are to work on the single-shift system, and the whole matter is to be investigated.

Princeton.—The Canada Copper Corporation is moving boilers and machinery from Phoenix, Boundary Falls, and Mother Lode to Princeton, where the 2000-ton mill is being constructed.

Ontario

Porcupine.—The Dome company, with 60 men, is developing on the 1250-ft. level, driving toward the east.

CHILE

Chuquicamata.—The Chile Copper Co. reports as follows for the first quarter of 1918: The net profit on copper delivered was $1,675,385. Deducting interest and bonds, $525,000 discount, etc., and adding sundry income, the net profit was $1,124,498. The cost of production, exclusive of excess profits tax, etc., was 18.38c. per lb., f.o.b. plant, including depreciation, 11.61c.; and delivered at Atlantic ports 14.39c. The leaching-plant treated 829,553 tons of 1.76% ore, making a recovery of 82.54%. The output was 24,876,498 lb. of copper, 940,000 lb. less than in the last quarter of 1917. There was 18,072,630 lb. sold at 23.83c. per pound.

Sewell.—Braden Copper Co. produced 6,020,000 lb. in September. This is the lowest yield since April.

MEXICO

Mexico

El Oro.—Directors of the El Oro Mining & Railway Co., in a report issued at London on September 27, state that the publication of the annual balance-sheet, etc., is undesirable at this time. The mine and mill worked at reduced capacity during the year ended June 30, 1918. Many difficulties hampered operations and increased costs. In March it was decided to work at full capacity, but this cannot be done for some time. Enough profit was earned to pay a dividend of 1s. (24 cents) per share, equal to £57,375 ($274,000). A. F. Main is general manager.

Sonora

Cananea.—Greene-Cananea produced 4,900,000 lb. of copper and 149,332 oz. of silver during September. This is almost equal to the past months output.

PHILIPPINE ISLANDS

Baguio.—The semi-annual report of the Benguet Consolidated Mining Co., for the period ended July 1, 1918, shows that the profit was ₱267,705. Three dividends, totaling 12½%, amounted to ₱125,000. A hoist, power-plant, head-frame, motor-truck, etc., cost ₱68,935. Contributions to Liberty Loans were ₱14,000. The period was one of construction and operation, little development of ore-reserves being done, save cleaning-out and re-timbering the old section of the mine, closed since 1909 and 1911. The mill treated 11,334 tons of ore, averaging ₱43.81 per ton. A. W. Beam is president, and C. M. Eye is superintendent.

TRANSVAAL

Cable advice on September 27 to 'The Financial Times' in London states that out of a complement of 1000 natives at the Village Main Reef mine, 213 are suffering from Spanish influenza; at the Ferreira Deep 299 out of 350; and at the City & Suburban 322 out of 2100. Ninety whites are affected at the same three mines. The outbreak is spreading to all mines. During September it is estimated that over 10,000 cases occurred, mostly among natives, but so far only one death has been reported.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

Albert Burch was at Butte last week.

E. A. H. Tays, of San Blas, Mexico, is here on a visit.

Horace F. Lunt is at the E. O. T. S. Camp AA, Humphreys, Virginia.

John Linn is assisting **Morton Webber** in a mine examination at Mackay, Idaho.

Stuart Croasdale has changed his business address to 730 Symes Bdg., Denver, Colorado.

Augustus Locke, of Boston, is on his way to Washington, to join the Engineer Corps of the Army.

H. T. Matson passed through San Francisco on his return from Korea, going to Clarkdale, Arizona.

C. R. Miller, of the Tonopah Mining Co., has returned from a visit to the Mandy mine, at Schist lake, Manitoba.

Joseph Moore, superintendent for the Victor Power & Mining Co. for three years, has resigned and gone to Oakland.

R. G. Hall was delayed in sailing from San Francisco to Burma; he departed on the steamer leaving on October 18.

Lee O. Kellogg, mining engineer to the South American Development Co., at the Zaruma mine, in Ecuador, is at New York.

F. B. Weeks, of the U. S. Smelting, Refining & Mining Co., came from Salt Lake City to Berkeley, returning at the end of the week.

Tomizo Sasabe and **Zenkichi Nanase**, of the Mitsubishi Mining Co., in Japan, are visiting the mining districts of the United States.

Arthur S. Dwight, Major in the 11th Engineers, is at Marseilles, France, having been detailed to supervise metallurgical work.

F. N. Flynn has resigned as general superintendent for the Consolidated Mining & Smelting Co. of Canada and is now at New York.

Max J. Welch has returned from New York to Los Angeles until the first of the coming year. His address is 1210 Hollingsworth Bdg.

A. G. Haultain has been attached, with the rank of Captain, to the Engineering Unit of the Canadian Expeditionary Force to be sent to Siberia.

William B. McPhee, formerly superintendent for the Como Consolidated Mining Co., at Dayton, Nevada, has become general superintendent for the Dromedary-Hump Consolidated Mining Co. at Fairview, Nevada.

F. M. Smale, manager of the Portland mine at Cripple Creek for 23 years, has resigned. He rose from miner to manager. **G. M. Taylor**, the mill superintendent, succeeds him, to be in charge of all operations. Mr. Smale and wife left Colorado for a motor-tour through California, and will winter at San Diego.

C. B. Lakenan, manager for the Nevada Consolidated, Ely, Nevada, is leaving for Chile. **H. A. Guess** succeeds Mr. Lakenan. **C. V. Jenkins**, for many years business manager for the Nevada Consolidated, has been transferred to the New York office. **C. Zeigler**, who has been secretary to Mr. Lakenan for many years, is now business manager.

W. C. Grout, secretary to D. C. Jackling in his San Francisco office, died of pneumonia on October 15. He was well known by those that visited Mr. Jackling's office and his death at the early age of 34 will come as a shock and a cause of deep regret to many in the profession.

THE METAL MARKET

METAL PRICES

San Francisco, October 22

Aluminum-dust, large and small lots, cents per lb.	65—70
Antimony (wholesale), cents per pound.	15
Copper, electrolytic, cents per pound, in carload lots.	26.00
Copper, electrolytic, cents per pound, in small quantities.	27.35
Lead, pig, cents per pound.	8.30—8.80
Platinum, Government price, per ounce.	$105
Quicksilver, per flask of 75 lb.	$120
Spelter, cents per pound.	11.50
Zinc-dust, cents per pound.	15

ORE PRICES

October 22

Chrome, no definite quotations available.

Fluorspar, 85% CaF_2, f.o.b. shipping point, or San Francisco, per ton	$22—$30
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 45%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 90% Mo_2S	$1.25
Pyrite, per unit of sulphur, cents	28—32
Tungsten, 60% WO_3, per unit	$20—$26

Chrome: See pages 547 and 571 of this issue.

It seems for the present chrome is practically unsalable. Every buyer approached has the same answer: "that his requirements for the present year are fully covered under contract." No big business has been heard of in any direction, though sellers were perfectly willing to shade their prices.—Charles Hardy's weekly report.

EASTERN METAL MARKET

(By wire from New York)

October 22.—Copper and lead are unchanged. Spelter is quiet but stronger.

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government has fixed its maximum at 48.81 pence for metal 925 fine.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.35c., respectively, until August 15. On August 7 the current rates were again fixed until November 1, prices to be effective on the day of shipment, not the day of sale.

Quotations in cents per pound are as under:

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. This is to be continued until January 1, 1919, the price at point of delivery to be at East St. Louis plus freight. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

Zinc-ore prices at Joplin, Missouri, were $2.50 per ton lower at $50, and the demand was lighter last week.

The weekly reports of the U. S. Geological Survey show that spelter production is decreasing slightly, while stocks are dropping 2000 tons per week.

LEAD

Lead is quoted in cents per pound, New York delivery. Early in July, producers agreed to fix prices at 8.05c. per lb., New York.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefor $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds.

ORES (New York)

Antimony: No market in this ore here.

Manganese: Brazilian ore has sold at $1.20 per unit for 40 to 50% Mn content, at least 6000 tons having changed hands recently. This compares with as high as $1.35 to $1.40 per unit not long ago. The manganese-ore market is easing.

Manganese Alloys: The September output of these alloys made a new and phenomenal record, according to blast-furnace reports by 'The Iron Age.' American producers made over 66,000 tons, or an excess of 12,000 tons over best previous record. About 40,000 tons of this was spiegeleisen, also a record.

Molybdenum: No business is reported to have been done, with quotations nominal at $1.25 per lb. It could probably be bought under this.

Tungsten: A good demand is reported for the higher-grade ores, but a lighter one for the lower grades. Regular prices are said to be maintained at $25 to $26 per unit. The lower grades are quoted at $19 to $24 per unit. Peace prospects are said to have had little effect thus far. Ferrotungsten is reported to have been offered as high as $2.80 per lb. of contained tungsten.

Eastern Metal Market

New York, October 16.

The prospect of peace has had some influence in the markets generally, particularly those that are still 'open'; but all of them are quiet.

In copper circles there is little expectation of any change in price after November 1, due to international developments.

The tin market is exceedingly lifeless, and all concerned are awaiting official developments. No price has yet been fixed.

Lead is tighter than ever, but is being satisfactorily handled by the Lead Producers' Committee.

Zinc has fallen again gradually until it has nearly reached a cost basis, in the opinion of some producers. It is now steadying somewhat.

Antimony has declined and again exhibited a tendency to be firm.

In the steel trade, the sole topic has been the effect of a possible sudden ending of the War. It has, however, not been a disturbing factor. The general view is that, apart from shell-steel, some if which would probably be cancelled, the material now in the greatest demand would show no decided falling-off. Government shipbuilding would continue, and railroad equipment contracts would keep many mills busy for a long time. It is, however, conceded that in some lines an early peace would cause unsettlement and re-adjustment. The present Government price-fixing machinery is relied upon to stabilize the market for some time when war demand falls off. The dominant note in the whole industry, however, is the continued concentration of all effort on greater pig-iron and steel output. Steel-ingot output in September made a decidedly larger gain than that of pig-iron, companies representing 85% of the country's capacity producing 3,200,000 tons, or at a rate for the whole industry of 47,000,000 tons per year. The influenza epidemic has cut down output in eastern Pennsylvanian plants.

COPPER

As the time approaches for a decision on a new price for copper after November 1, the feeling is growing stronger that no change will be made and that the present price of 26c. will continue until the War ends. No reason appears to exist for a lowering of the price. It is felt by many that after price regulation ceases an advance will follow, because economical conditions will not alter quick enough to lower costs and because the present price is regarded as too low under present conditions of operation. It is said that a meeting to decide the price-level of the future will be held at Washington about October 23. Supplies of the metal are not regarded as ample by one authority, so great is the present demand for war purposes, and practically nothing is left for any small existing domestic use. Refinery production was interfered with quite considerably by the great shell-loading plant explosion of October 5 and 6 at South Amboy, New Jersey. At least two days' operations were cancelled because of this. The output is stated to be likely to fall off 10,000,000 lb. in October from this cause alone, and it has not been adequate for several months. An interesting published statement is to the effect that stocks of copper in Japan are increasing, and that producers there are unwilling to sell to European or American consumers at the fixed prices in those countries.

TIN

The actual tin situation is difficult to analyze; reports differ. A most reliable source of information states that there are as yet no definite official developments as to what has happened or what is to happen. It is the expectation of this authority that within the next week or ten days an announcement will come from Washington informing the whole trade, including importers, under just what conditions the trade will operate. Another authority says the control and allotment of the metal are now similar to copper and lead, but that no price has been fixed. It is a fact that the War Industries Board recently sent out a questionnaire to all dealers and users of tin, calling for a statement as to business done from June 1 to October 1, with replies to be in not later than October 15. Some definite statement will be a welcome relief to all concerned. As to general conditions, the market is dead and without interest. There has been no offering of future shipment tin for two weeks. There is some metal in transit and to arrive, and there has been limited offerings of this. Such sellers seem ready to make concessions on this metal for both positions, prompted by a desire to get from under before a price is fixed. The quotation for spot metal continues nominal at 81c., New York, with very little metal available. Tin arrivals in October, to the 9th, total 350 tons at Atlantic ports. The London quotation for spot Straits yesterday was £366 10s. per ton.

LEAD

The general situation is unchanged with complete control in the hands of the Lead Producers' Committee, which seems to be giving entire satisfaction, there being no objections recorded. The market is bare of inquiries, in fact all of them are probably handed directly to the Committee. The entire situation is tight. Agreed maximum quotations continue unchanged at 7.75c., St. Louis, or 8.05c., New York.

ZINC

The quotation yesterday for prime Western was 8.60c., St. Louis, or 8.95c., New York, for October or nearby delivery. The market has therefore continued to soften the past week until the foregoing level was reached. Today the tone is steady and stronger, due largely to prospective Government buying. The Army is to purchase 8000 tons of grade C, practically prime Western, for delivery in the last two months of this year, and the Navy is to buy 1000 tons for shipment over the next six months. Demand is light and the decline has taken place on small sales. It is not believed that any large sale could be put through at the present level of prices. Some state that the present quotations are down to a cost basis. For delivery in the last two months of this year the quotation is 8.25c., St. Louis, or 8.60c., New York. Some attribute the decline of the past two weeks to a prospect of peace. The weekly report of the Government, however, shows that the statistical position is strong with output and stocks decreasing. Stocks in the last week have fallen 1866 tons.

ANTIMONY

The market is lower at 13.62½c., duty paid, New York, for prompt and early delivery of wholesale lots. It is reported that several sales have been put through quietly. There is an inquiry of 3000 tons from the Government.

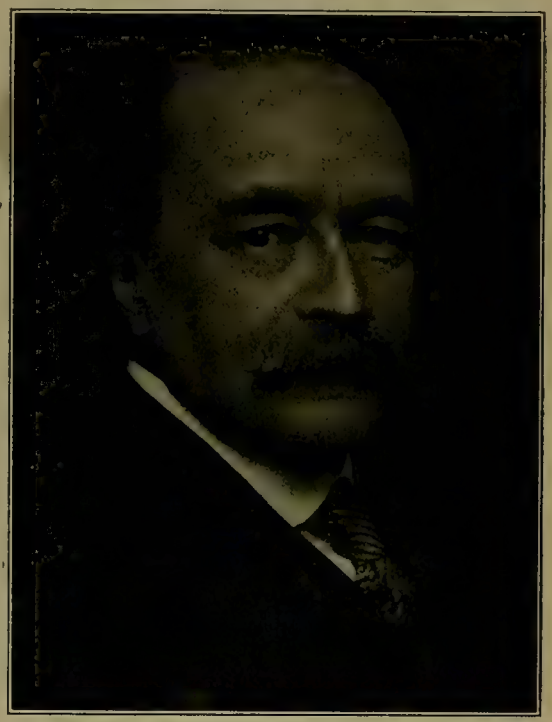
ALUMINUM

Government maximum prices control the market for No. 1 virgin metal, 98 to 99% pure, and for scrap at 33c. per lb. for 50-ton lots, at 33.10c. per lb. for 15 to 50-ton lots, and at 33.20c. per lb. for 1 to 15-ton lots.

Book Reviews

Incidents in the Life of a Mining Engineer. By E. T. McCarthy. Pp. 384. George Routledge & Sons, London; E. P. Dutton & Co., New York. For sale by 'Mining and Scientific Press'. Price, $4. Proceeds devoted to the maintenance of the St. Dustan's Hostel for Blinded Soldiers and Sailors.

This is an unpretentious recital of the varied experiences of a distinguished mining engineer, one of the veterans of the profession, with a memory of events that go back to the very beginning of mining explorations and developments in countries far apart. Mr. McCarthy is a graduate of the Royal School of Mines, London, but he served his apprenticeship in North Carolina, first as assistant-manager and then as manager of a gold mine among the 'Moonshiners'. He tells stories about them, about the 'darkies', the Southern white people, and his fight with a 'carpet-bagger'; indeed the first chapter is a good sample of the book, for it is full of interesting and amusing notes, all told in a conversational manner, without any attempt at literary finish, but full of human kindness and penetrating good sense. From the South he went to Denver, and from there to the Spanish Peaks, and back to Leadville, in 1879. He went on prospecting trips and acquired an interest in a promising claim. He tells about the Utes, about escapes from death in various guise, and something about the boom at Leadville. Those early experiences in America, he says, taught him much, widened his horizon, and made him keep always "a very warm corner in my heart for the U. S. A." The reviewer happens to know that in the expression of this sentiment, as in everything, he is sincere. Indeed, the lack of affectation of any sort pleases the reader continually; he feels complimented by being taken into the engaging confidence of a well-informed and much-traveled man. The next three chapters describe pioneer work in West Africa, in what is known as the Gold Coast, more particularly Wassau and Appolonia. Much of this has historic value, for it covers the very beginning not only of mining but of industrial development among the tribes of the interior. There is good fun in his story of an antic played by him at Monrovia, the capital of Liberia; there is scientific value in his description of the aboriginal 'lake-village'; and there is pathos in his sympathetic story of Bonnat's career. He had many 'close calls' during his adventures in the jungle and all kinds of strange happenings among the natives are described entertainingly. The author has some eminently sensible things to say about the climate of the Gold Coast and the methods for mitigating the enervating effects of it. Next he went to Morocco and then to Canada, in 1883. Mr. McCarthy sent the first cablegram from Calgary to Europe, and the first paid telegram to Winnipeg. He describes the building of the Canadian Pacific railroad and the opening up of the 'Great Lone Land'. He traveled on horseback, with companions picked up on the way, from Calgary through Montana to Vancouver. He inspected the coal mines; also the Drumlummon mine, if his reference to a mine not far from Helena is thus to be interpreted. At Victoria he saw the Krakatoa sunsets. From Vancouver he crossed the continent by way of San Francisco, Denver, and St. Louis to New Orleans, paying a visit to his former 'stamping-ground' in North Carolina before reaching New York, where he sailed on the old 'Celtic', not the later steamer of that name, and had the experience of a voyage that lasted 31 days from New York to Liverpool. The 'Celtic's' main shaft broke on the third day out, the screw would not turn or run loose, the vessel could not be steered, she was overtaken by a terrific gale, she was blown close to the Bahamas, the captain rigged her with sails, but on the 27th day the 'Britannia' came to the rescue and towed her safely to port. Mr. McCarthy had many other adventures, but this one is mentioned to prove his knack of getting into trouble, and of getting out successfully. When he started on his next journey of observation as a mining engineer the steamer on which he was traveling to Colon became crippled owing to a breakdown of the engines; the vessel drifting for six days before the engines could be re-started. It took 19 days to go from Plymouth to St. Thomas. At Port au Prince he had an adventure with predatory negroes, but the story cannot be compressed, so the reader of this review must read the book if he wants to enjoy it. At Colon he saw the French attempt to dig the Panama Canal under the De Lesseps company.



E. T. McCarthy

At that time Colon was a sink of sewage and iniquity. He describes it effectively; also the engineering difficulties that proved too much for De Lesseps, who was not an engineer, although his son was. He pays his tribute to the sanitation of the Canal Zone as carried out by the American administration and rates that accomplishment as high as the building of the Canal itself. He was now on his way to take charge of a gold mine in Nicaragua, in the hills beyond Leon. Three chapters are devoted to his two years' sojourn in that country. During most of this period a revolution was in progress, he had great difficulty in running the mine, he went through all sorts of bad quarters of an hour, yet he found time and inclination to admire the scenery, to be charmed by the natives, to study the life of the tropical jungle, to do many acts of kindness, and to possess his soul in self-respectful serenity. His descriptions of the queer ways of various animals and insects are intensely interesting; so are his analyses of the characters of the untutored mestizos. Just before leaving he witnessed the eruption of Momo Tombo and had a narrow escape both from violent earthquakes and volcanic ejectamenta. A short holiday in Switzerland and he was off again, to the Malay Peninsula.

While in the Far East the author was the guest of the

Sultan of Jahore, who gave him many kinds of curry, all spoiled by cocoanut milk. He had many amusing experiences and others that were disagreeable, as, for example, an encounter with a swarm of leeches while in the jungle on his way to a tin mine. This had been salted, as he ascertained by continuing to wash large samples, until the supply of 'salt,' that is, cassiterite, failed the vendor. Mr. McCarthy, in his anxiety not to talk shop, does not give the names of the mines that he visited or managed during the period covered by these reminiscences; that is a pity; for the giving of such information would have done no harm to anybody and would have heightened the interest of the book. A chapter is given to China and New Zealand. A mutiny on board ship and a night spent in the hold of another ship fighting rats are among the stories included. Then follow four chapters on Uruguay, where he was in charge of an unnamed mine and whither he brought his bride, the wife to whom he refers many times in the most touching terms. In that country, as elsewhere, he never missed anything that came his way, so that this part of the book is alive with interest. The last chapter recites his first experience in the Transvaal; it ends abruptly, as if the author had made up his mind that he had written enough, for the book covers only the happenings of 18 out of his 43 years of professional life as a mining engineer, and the reviewer knows that the later period includes much that would have been worth recounting. The book gives evidence of war-time by its typographic errors, especially in the spelling of names; it contains material that more carefully written and edited, with dates and names, would have constituted a volume of permanent value, and one can only regret that, having made up his mind to depart from the modest reticence habitual to himself, Mr. McCarthy should not have been a little more ambitious, instead of being satisfied to do what he set out frankly to do, namely, to write a book that he could sell in behalf of the St. Dustan's Hostel for Blinded Soldiers and Sailors. He has succeeded in his effort, for the book has sold well. We commend it to our readers both on its merits and for the cause to which it is dedicated.—T. A. R.

Company Reports

MODDERFONTEIN B GOLD MINES, LIMITED

Property: 1468 claims (1½ acres each), mines and mill on the Rand, Transvaal.

Operating Officials: C. L. Butlin, manager; H. Stuart Martin, consulting engineer.

Financial Statement: gold sold during 1917 realized £1,193,717 ($5,630,000), while expenses totaled £502,630 ($2,400,000). The profit was £709,601 ($3,400,000). Balance at Dec. 31, 1916, was £306,297 ($1,440,000), and that a year later £246,570 ($1,290,000.) Government taxes amounted to £82,503 ($394,000).

Dividends: two of 40 and 45% absorbed £595,000 ($2,860,000), making a total of £2,450,000 ($11,760,000) in six years.

Development: the labor supply was unsatisfactory, so new work fell off to 9941 ft. Of this, over 60% was in pay-ore. Reserves amount to 3,523,810 tons of $9.20 ore, an increase of 150,000 tons.

Production: an average of 96 stamps (80 gravity and 16 Nissen type) and 6 tube-mills crushed 517,500 tons, making a duty of 15.9 tons per stamp-day. Amalgamation and cyanidation extracted 94.7%, yielding 286,010 oz. of gold. Ore assayed $11.08 per ton.

Costs: all departments totaled $4.66 per ton, an increase of 38 cents per ton.

SEOUL MINING CO.

Property: gold mines and mills in Chosen (Korea).

Operating Officials: A. R. Weigall, consulting engineer and general manager; J. F. Mitchell-Roberts, assistant, consulting metallurgist, and acting superintendent of Tul Mi Chung; F. A. Oldis, auditor; G. C. Cranor, accountant Tul Mi Chung mine; Heiichiro Maki, consulting electrical engineer; S. Ishikuma, superintendent of electric power-plant; A. C. Mack, superintendent Suan mine; B. V. Barton, superintendent general development of Concession area; K. I. Yun, H. T. Matson, and F. A. Smith, in charge of development at Tong Ahm, Kung Kol, and Nau Chauri; J. H. Woolf, in charge of Peh Jai; Alex. McFarlane, Tul Mi Chung mine foreman; James Williams, Suan mine foreman; E. L. Blackwell, Tul Mi Chung mill foreman; H. B. Fields, Suan mill foreman; W. Guy B. Boydell, superintendent of ore estimation and surveying; D. W. Leeke, assistant to former; W. W. Barnett, chemist and assayer; C. S. Crowe, millwright and mechanical foreman; S. M. B. Aoki, Japanese assistant to general manager; and W. H. Minford, medical officer at Suan.

Financial Statement: the past two years compare as under:

	1917	1916
Total receipts	$1,698,417	$1,836,339
Operating charges	745,096	703,275
Interest on notes	75,833	79,375
Royalties and taxes	170,877	128,600
Depreciation	91,558	40,000
Profit	330,526	918,502
Dividends	255,500	250,000
Current assets	1,323,880	1,162,587
Current liabilities	202,277	173,881

Development: ore-reserves in the various mines total 816,957 tons, averaging $8.57 per ton, compared with 837,122 of $9.42 in 1916. The Suan mine is expected to be exhausted by the end of 1918. Tul Mi Chung contains 484,670 tons of $10.30 ore (gold-copper-silver), and Soctarie, 267,717 of $4.93 ore (tungsten-gold-copper). Tailing at Tul Mi Chung amounts to 180,000 tons, worth $2.78 per ton. The total amount of work done during 1917 was 31,312 ft., the greatest in any year. The cost of supplies was much higher than before.

Production: the milling results may be tabulated so:

	Suan	Tul Mi Chung
Ore treated, tons	65,844	149,195
Gross value per ton, gold and copper	$7.80	$9.94
Extraction, gold, per cent	87.43	56.87
Extraction, copper, per cent	86.98	89.64
Value of bullion	$274,306	
Value of concentrate	1,362,617	

Costs: these totaled $4.02 per ton, against $4.68 in 1916.

Metallurgy: there was added to the Tul Mi Chung mine a ball granulator and a Dorr classifier of the bowl type. While the recovery of copper is high, that of the gold is low. An immense amount of experimenting has been done to improve this condition, at the mine, in America, and in England. Tests completed indicate an extraction of 70% of the gold left in the tailing, with a cyanide consumption of 2.3 lb. per ton of tailing. For the present, this work will proceed, as the proposed 600-ton plant cannot be erected as long as existing conditions prevail. Cyanidation will supplement flotation. The total recovery of gold from the ore will be 85%, against 60% at present.

Another problem is the tungsten-gold-copper ore of the Soctarie mine. The valuable mineral is the 0.3% scheelite content. Separation of the concentrate into marketable products is the desired end, and this was fairly well solved. Twenty stamps of the Suan mill will be used for this ore, after certain alterations are made. In the 'Press' of October 5 the treatment of this ore was described as given in the annual report.

No mention is made of bismuth production this time.

INFORMATION FURNISHED BY MANUFACTURERS

THEORY OF GRAPHITE LUBRICATION

The theory of lubrication is to keep two moving surfaces apart. Metals are never smooth. Under a microscope the most highly polished piece of metal resembles a nutmeg grater. There are little pin-points sticking up, pores in the metal, tool-marks, and other irregularities. When the oil or grease squeezes out these irregularities interlock. This is the cause of friction. These little pin points also break; this is termed 'wear.' Tiny particles of metal in the bearing-parts act as an abrasive. Lubricating graphite overcomes this. It first fills the pores of the metal, after which it places a veneer over the wearing-surfaces. After the graphite veneer has been secured, friction will have been reduced to a minimum. Not only this, but the wear of the metal will be prevented, for the reason that the contact now is between graphite and graphite and not metal and metal. It is obvious that if metals do not rub together they cannot wear. To demonstrate this, take two small pieces of hard-faced paper. Lay one upon the other and try to move the upper piece over the lower one by applying weight and force. It is friction that holds the two pieces of paper together. Now take some fine flake graphite and run a little on each piece of paper, place the graphited surfaces together, and do the same as before. Now the papers will move readily one upon the other.

Again, take one piece of paper, on the corner of which is no graphite, and rub it upon the other graphited piece, in all directions, to work the graphite thoroughly into the paper. Look at the paper and you will observe that the graphite has filled the pores, and has placed a veneer over the surface. Lay the two pieces of paper together and rub as before, placing weight upon it, and you will find that the more weight applied, in other words, the more work the flake-graphite is given to do, the easier it moves, and, unlike oil or grease, it does not and cannot be squeezed out from the point of contact. It gathers at the point of contact until it has filled the pores and irregularities in the paper. This test illustrates that, irrespective of weight, a film of graphite cannot be squeezed out. The more weight applied, the more firmly is it embedded in the metal, and the smoother the surface becomes.

WALWORTH STILLSON WRENCH

With the idea of releasing labor, and conserving material and fuel, the **Walworth Mfg. Co.**, of Boston, has, at the urgent request of the War Industries Board, adopted as a war measure, the following: (1) We will discontinue the manufacture of the 6-in. genuine Walworth stillson-wrench. (2) We will discontinue the manufacture of the wood-handle genuine Walworth stillson wrench in all sizes, making only the steel handle. (3) We have adopted the 'war finish' as the standard finish for genuine Walworth stillson-wrenches for the duration of the War. No change whatever has been made in patterns or quality of material or workmanship in the wrench proper. A tag will be attached to each wrench, giving the reasons for the change to 'war finish' standard. Although the 'war finish' wrench presents a rougher appearance, it is the same sturdy, dependable tool that it has been for nearly fifty years.

COMMERCIAL PARAGRAPHS

The Electrical Alloy Co., Morristown, Pennsylvania, has filed plans for the construction of an addition to its plant.

The Metal Alloys Co., Albany, New York, has increased its capital from $100,000 to $500,000 for extensions and expansion.

The Chicago Pneumatic Tool Co. announce the appointment of B. H. Tripp as district sales-manager for the Pacific Coast territory.

The Illinois Zinc Co., La Salle, Illinois, has completed plans for the erection of an addition to its plant to cost about $400,000.

The Newark Bay Smelting & Refining Co., Plum Point Lane, Newark, New Jersey, has filed plans for the erection of an addition to its works.

The Radium Luminous Material Corporation, Orange, New Jersey, has filed plans for the erection of an addition to its plant on Alden street.

The Levin Graphite Co., Ashland, Alamaba, recently incorporated with a capital of $100,000, is planning for the operation of graphite properties in this vicinity.

The Badger Mining Co., Joplin, Missouri, has awarded a contract to Edgar Foster, of Joplin, for the construction of a new concentrating plant at its works near Joplin, to cost about $56,000.

The Empire Silica Co., Wilmington, Delaware, has been incorporated with a capital of $100,000 to operate silica mines. F. A. Armstrong and M. M. Clancy, Wilmington, are the incorporators.

Charles A. Foyer & Co., of Cleveland, Ohio, manufacturer of typewriter ribbons and carbon paper, announces a prepaid mail-order and express-delivery department at prices that represent a great economy.

The Penn Electric Smelting Corporation, New York, has been incorporated with a capital of $100,000 to operate a smelting plant. W. W. Gephart, C. Batchelor, and D. P. Earle, 165 Broadway, are the incorporators.

The Metallurgical Chemical Corporation, New York, New York, has been incorporated with a capital of $50,000 to manufacture chemicals of various kinds. R. J. Eddy, C. R. Allison, and A. M. Skivens, 111 Broadway, are the incorporators.

Zelnickers Bulletin No. 247 covers a wide range of ready-to-ship equipment, especially in the line of railway rolling stock, for standard gauge, 36-in., 30-in., and 24-in. gauge. It also lists steam-shovels, ditchers, air-compressors, and machine-shop tools.

The United States Steel Corporation, Ordnance Department, is planning for immediate work on its proposed new gun and projectile plant for the Government at Neville Island, Pittsburgh. The contract has been awarded to the **Illinois Improvement & Ballast Co.**, Chicago, at a price of

$6,000,000 for grading, excavating, concrete foundations for buildings, and other work to get the site ready for the new structures. The ordnance plant will occupy an area of about 400 acres.

The National Fluorspar Co., Union City, Tennessee, recently organized with a capital of $100,000, is planning for the development of about 200 acres of property near Ida, Kentucky. Machinery and equipment will be purchased for the new works. W. D. Fry is president of the company.

'Westinghouse Investments and Relays' is the title of Catalogue 3-B, issued by the **Westinghouse Electric & Manufacturing Co.**, a handsomely illustrated volume of 103 pages, dealing with electric measuring equipment and laboratory devices. It supersedes the Catalogue 3-B issued in July 1916.

The Commercial Electrolytic Corporation, 111 Colgate avenue, Buffalo, New York, manufacturer of ammonium persulphite, and general chemicals, is considering the construction of a new plant for increased output. The company has recently completed the erection of a plant in the South Buffalo Terminal district.

The Mineral Corporation of America, Inc., 42 Broadway, New York, is planning for the development of feldspar properties in North Carolina. The company is now operating the property, in part, for the chromite, and it is understood that new machinery and equipment will be purchased for the proposed new extensions.

Boiler-pitting. An English engineer reports that he had used suspended pieces of zinc to counteract the tendency of boiler-pitting, but with mild-steel boilers it was ineffective, because of the large percentage of carbon in the steel. Pitting had been prevented by cleaning off the scale and painting with a weak portland cement solution.

Coal mines in Brooke county, West Virginia, will be developed by the **Electric Mining Co.** of Wheeling. This company is planning extensive development and mining work, and, it is understood, will soon purchase machinery and equipment. The company has a capital of $1,000,000. Frank B. Ball, Plainfield, New Jersey, heads the organization.

Zelnicker's Bulletin, No. 249, just issued, lists five 91-ton Baldwin locomotives, thoroughly over-hauled and renovated, so as to pass the Federal requirements. There are also on hand, ready for immediate delivery, four Marion and two Bucyrus steam-shovels, from 1¼ to 4-cu. yd. capacity, and a number of small traction steam-shovels. The list includes gondolas, flat-cars, and other rolling-stock.

By agreement with the Government, the **General Electric Co.** is conserving its stock of materials and finished products for direct and indirect Government requirements, and has only slight discretion in the matter. If you favor the company with your order, and it is for Government work, give the name of the first contractor, the Governmental and Departmental order-numbers, and the Priority-Certificate numbers if any. If not for Government work, state the name of the ultimate user, the character of the product, and the relation of this material thereto. It is essential that the above information be furnished before your orders can be entered and executed. For your convenience the company will send blank-forms upon which the required information may be transmitted.

The high board fence surrounding the property of the East Butte Copper Mining Co., Butte, Montana, and also its wooden buildings, were painted with **Dixon's** silica-graphite paint in 1910. They have had eight years of service. E. D. Pratt, purchasing agent for that company, a real efficiency man, told W. H. Wanner, representative of Dixon's San Francisco sales office, that we could use his name and refer to this excellent service of Dixon's silica-graphite paint on his plant as an example of the fact that it is an excellent protective paint for wood or metal.

The word 'Angelus' brings to mind the beautiful masterpiece by Jean François Millet, but the 'Angelus' of present times is a rude contrast to this. Its weird, penetrating screech call to halt the rush of business for a brief prayer for the success of the Allied arms. Patriotic Christian people throughout the country are furthering the Angelus movement. To apply the idea, there was needed a signal louder and more distinctive than ordinary bells or whistles. The Federal Electric Siren was the one that filled this requirement. They have been mounted on the tops of tall buildings in Washington, D. C., and in St. Louis, the two largest cities which so far have taken up the movement. The instrument is identical with the one generally used as a fire warning, and by mines and industrial plants as starting, quitting, and emergency signals. Federal sirens are manufactured and installed by the **Federal Sign System (Electric)**, Lake and Desplaines street, Chicago, and are advertised elsewhere in these pages.

Arthur Lamotte, manager of the technical division of **E. I. du Pont de Nemours & Co.**, writing on the cause of burnt-out charges of powder, commonly called 'stinkers' in miners' parlance, says: "One of the most prolific causes of this condition is lacing the fuse through the dynamite cartridge, or inserting the fuse and cap so deeply in the dynamite cartridge that part of the dynamite burns before the spark from the fuse reaches the blasting-cap. It must be remembered that in a bore-hole, under strong confinement, dynamite burns much more rapidly than it does in the open air, and it is possible for a considerable amount of dynamite to burn before the cap explodes. There is no doubt that the storage of explosives in tunnels or 'dugout' magazines has a most deleterious effect, as any kind of explosive loses a great deal of its strength when subjected to the humid atmosphere encountered in these places. The more moisture absorbed by the dynamite the less sensitive it becomes, and the more chance there is of a mis-fire. Storage of blasting-caps in a damp magazine is even more likely to cause trouble, as a weak blasting-cap, into which moisture has penetrated, will frequently ignite only the dynamite and not detonate it. A dugout or tunnel-magazine is an extremely expensive proposition, as any explosive left in it for even a few weeks will lose a great deal of its strength, so that while the operator may have paid for 40% dynamite, he may not realize more than he would out of fresh 25% dynamite. The expense in maintaining such a magazine can be readily calculated. In the matter of handling of fuse there are two points worth considering: one is that any tool used for cutting fuse should be of such construction that the blade gives a shearing-action on the fuse. A pinching-action is liable to smear the waterproofing compound over the powder core. The principal manufacturers of explosives have developed a very efficient combination crimping and cutting-tool which gives a perfectly clean cut. Where a large number of lengths of fuse are cut every day, about the best implement one can use is a pair of high-grade pruning shears made so that the blade can be taken out and sharpened from time to time. Any fuse-cutting tool should be cleaned every day with gasoline to prevent the waterproofing compound from gumming it up and preventing a clean cut. The fuse should be cut straight across, not at an angle, because the sharp point is not only dangerous to insert into a blasting-cap, but allows an air-space between the end of the fuse and the cap-composition, which may become filled with carbon di-oxide gas, preventing the end-spit of the fuse and acting as a fire-extinguisher on the flame. As the powder in the fuse-core is somewhat susceptible to moisture, only enough lengths of fuse should be cut for the day's work. These lengths should be stored in a dry place, and not taken into the mine until shortly before they are to be used."

THE WAUGH "DREADNAUGHT"

A Drill that Stays on the Job

The "Dreadnaught" not only stays on the job, but is getting results all the time it is there. There is no wasted time, power and labor through lost holes, for if the steel begins to bind or runs into a slip, the "Dreadnaught" can be cranked back while rotating without danger of breakage.

The ease of handling this Drill makes it popular with the men, and its low air consumption distinguishes it for its economy of power. It has established an unequaled reputation for efficiency, and while it has broken many tunnel records, yet it is light enough to be used unmounted for down hole work.

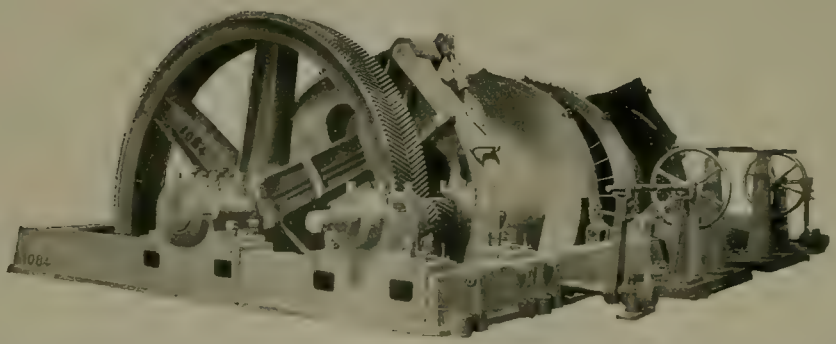
DEWCO ELECTRIC HOISTS

From Man to Machine!

You can HOIST ore on this man's back—

But this DEWCO hoist does the work of 600 men



One man with one hand can control a rope pull as low as 500 lbs. or as high as 50,000 lbs.
DEWCO Hoists are designed so that important points are accessible and in plain view.
Note the AIR-COOLED brake rings.
DEWCO Hoists are the culmination of careful study of general design to give greatest strength without excessive weight.
All clutches and brakes have a factor of safety of at least 10.
Hoists are completely assembled and tested to insure ample safety.

Write for bulletins Nos. 1065, 1066 and 1079.

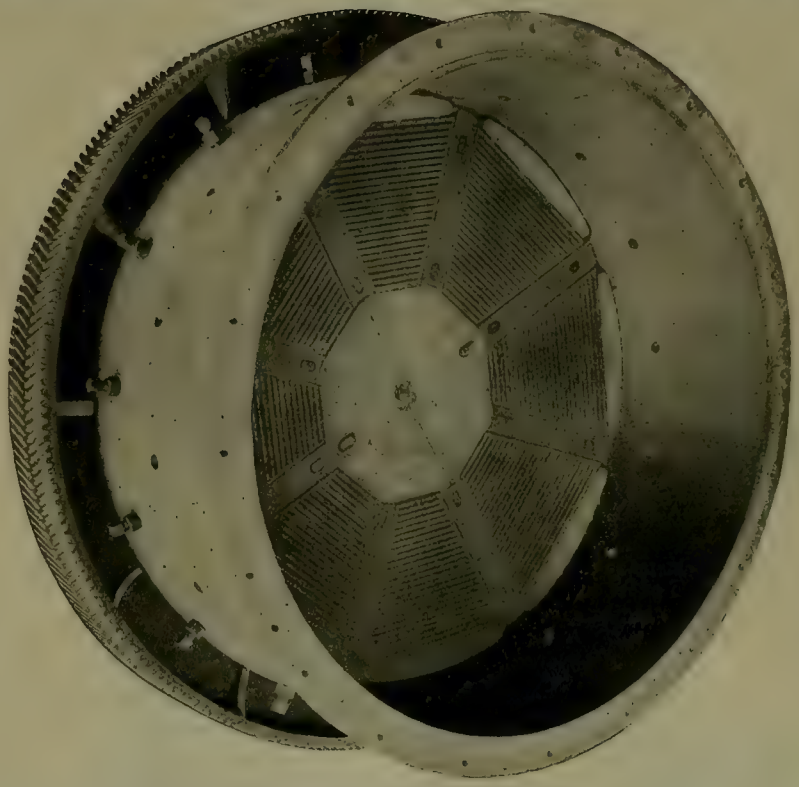
Established May 24, 1860, as The Scientific Press; name changed October 20 of the same year to Mining and Scientific Press.
Entered at the San Francisco post-office as second-class matter. Cable address: Pertusola

Branch Offices—Chicago, 600 Fisher Bdg.; New York, 3514 Woolworth Bdg.; London, 724 Salisbury House, E.C.
Price, 15 cents per copy. Annual subscription, payable in advance: United States and Mexico, $4; Canada, $5; other countries in postal union, 25s. or $6.

MARCY BALL MILL



The Marcy Grate—the feature that makes "Crushing, One Easy Step"—a fact

We have operated side by side, Marcy Mills, one without grates and the other regularly fitted, and found the mill equipped with its patented grate discharge has a much greater efficiency and capacity than the mill without grates and overflowing through the trunnion.

Therefore we know that this discharge end is not restricted, and that the grate has the effect of bringing about higher efficiency and a satisfactory product.

Here is a photographic reproduction of the inside discharge end of a No. 64½ Marcy Mill. This discharge end is made of high carbon tempered tool steel carrying a certain percentage of chromium to insure high wearing quality.

The grates are tempered so they will not upset. They carry very little taper, so that a minimum size product is maintained. Their depth is 3 in. and 3½ in. The No. 86 mill has a total discharge area of 1100 square inches.

Write for the New Marcy Booklet

Now ready for distribution—a comprehensive and most useful booklet on modern Ball Mill practice and results. A free copy will gladly be mailed at your request.

COPPER to the amount of 1258 million pounds was used by the United States and her Allies in the first seven months of the current year, the consumption of the United States during that period being more than double that of England, France, Italy, and Canada combined. The supply of refined metal in the United States during the first half of the year is estimated to have been 1401 million pounds, the apparent domestic consumption being 950 million pounds.

ACCORDING to the 'Financial Times', of London, the coal deposits of Spitzbergen, to which we refer elsewhere in this issue, were discovered by a Scotsman named Lamont in 1870, but no serious work was done until Mr. John M. Longyear started operations in 1905 in the name of the Arctic Coal Company. During the past summer another company, the Norwegian Spitzbergen Company, shipped 40,000 tons of coal from Green Harbor to Norway. Next summer, given favorable conditions, it is expected that 100,000 tons of coal will be exported from Spitzbergen.

CHEMISTS are in such demand that the Chemical Warfare Service of the United States Army has requested all men having had any chemical training or experience to fill out questionnaires that will be sent them on application. For the coming year 4000 chemists are urgently needed. Half of these are required by the Government and half for private enterprises. The Research Council, at the request of the War Department, has drawn plans for the education of young men by intensive training in chemical engineering to supply the pressing need. One group will be given a course lasting one year, a second group will be trained for two years, and a third for three years, before being inducted into service. These courses will be given partly in connection with the Students Army Training Corps.

UPON another page we publish this week a short, but timely and interesting, article on 'Mining in Russia' by Mr. Herbert C. Woolmer, formerly manager of the Spassky copper mine, in Siberia, and associated as mining engineer with other important enterprises in Russia before the Bolshevik disruption. Mr. Woolmer gives an idea of the paternal functions necessarily assumed by many companies in the former Tzardom and thereby suggests the havoc made with the internal economy of the country when the revolution destroyed the management of such enterprises. We are glad to give our readers this first-hand information and hope that Mr. Woolmer will find time to write for us again, because among the members of the profession in the United States there are many men keenly interested in the resumption of mining operations in Russia.

WIDESPREAD sorrow has been evoked by the sinking of the Steamer 'Princess Sophia' in the Lynn Canal, near Skagway, Alaska, during a storm in the night of October 25. This vessel, belonging to the Canadian Pacific Railway, was on her home voyage and was bringing with her 343 passengers, including a large number of men conspicuous in the mining industry of the Yukon and Alaska. All are reported lost. We note with particular regret the drowning of U. G. Moore, formerly U. S. Commissioner at Eagle City, John F. Pugh, U. S. Collector of Customs at Juneau, E. S. Ironside, Collector of Customs at Dawson, Walter Barnes, Jack Chisholm, George Milton, S. J. Baggerly, besides a group of men on the staff of the Yukon Gold Company, notably J. R. Young, T. E. Thorson, A. R. McLean, and Frank Brown. A large number of steamboat captains and river-men were on board from vessels now laid up for the winter. Many of these were well-known and much liked by the nomadic miners and mining engineers of the North. The passengers on this ill-fated vessel were coming 'out' at the close of the active season and were anticipating the happiness of rest and comfort after hard work. It appears that the steamer ran aground during the storm and that either it was deemed safer to remain on board or that an attempt to disembark in the boats was made too late. The disaster is deeply to be deplored.

WE note that the Treasury department of Great Britain has appointed a commission to investigate and report on "the War's effect on gold production in the British Empire." This commission is empowered to go thoroughly into the question of mining low-grade ores and to inquire how far, from the national standpoint, it may be considered important to ensure the continued exploitation of such ores; it is also asked to suggest a plan for stimulating the production of gold. The four members of the commission, under the chairmanship of

Lord Inchcape, will have Mr. William Frecheville as their technical adviser. Meanwhile the chairman of the Transvaal Chamber of Mines, Mr. E. A. Wallers, has stated that out of 49 companies now operating in the Transvaal, six are running at a loss and fifteen are operating close to the economic margin; if these 21 companies should be compelled, by force of circumstances, to cease their operations, the effects would be disastrous, not only in the Transvaal but in England. A decrease of $6,500,000 in production is recorded in the Rand output for the first eight months of this year. Here we may quote the remark made recently, at a bank meeting in London, by Sir Edward Holden, a highly respected authority on finance: "There will undoubtedly be a great demand for gold after the War, and when the South African gold is again offered for sale in London we should at all costs retain it in this country, and not allow other countries to take it from us, as was done before the War." It is interesting to observe the increasing interest in the subject at London; we trust that no less interest will be manifested at Washington, for the subject is one that concerns, not only the gold miner and his backers, but every citizen zealous of the national welfare.

MANY guesses have been made at the extent to which the cost of living has increased, but accurate data are difficult to obtain. The subject is of such significance, viewed in its relation to wages, that the National Industrial Conference Board undertook to analyze the statistics in possession of the Government bureaus, and to gather additional information. The conclusion reached is that the average increase in the family budget for the year ending June 30, 1918, over that for the fiscal year 1913-14, has been approximately 52%. On a classified list of items, the increases are as follows: food 62%, rent 15%, clothing 77%, fuel and light 45%, sundries 50%. No great variation in the elevation of prices was found to exist between the cities of the East and the West. As invariably happens when the trend of prices is upward the heavier burden falls upon salaried employees. Wages are more sensitive, since the cost of manufactured goods generally consists in large part of the outlay for labor; moreover, the facilities for transportation, as compared with those available at the time of previous crises in our history, have so relieved the working classes from the restraint of immobility as to enable them to take the utmost advantage of competition for their services. Consequently wages have risen in greater proportion than the advance in prices. This is true even with respect to foods, in the cost of which the element of labor enters to a smaller degree. Because of this the prices of food should increase more slowly, but our unscientific methods of distribution offer larger opportunities for profiteering in this branch of commerce. Government regulations will probably reduce the prices of such articles, but rents are expected to advance on account of higher taxes and increased insurance. In view of the foregoing it would appear that a large proportion of the miners, who are protected in many Western districts against unjust food prices, and are also provided with quarters at modest rates, have benefited by the prevalent high wages more than the workers in shipyards and factories, despite the alluring sums that are paid for labor in those industries. It is in the crowded centres of population that the workman is exposed to the worst evils of profiteering; the miner has a better chance to save money against the days of financial stringency that are sure to follow the War.

The Prospect of Peace

These are epoch-making days; at any moment the telegraph may bring news affecting the welfare of the world for generations to come. It is a time for mental restraint and judicial temper, for we are as much at the parting of the ways at this climax of our successful military campaign as we were at the beginning of the War four years ago. The exchange of notes between the President of the United States and the German government has brought the belligerent nations to the point where hostilities may cease suddenly by the surrender of the Enemy's armies or they may be continued with increased bitterness for many months into a spring campaign next year. With these alternatives is involved the sinister possibility of disagreement between the Allies. That possibility is unlikely and it is mentioned only in order to lay stress on the need for a maximum effort to preserve mutual goodwill and continued whole-hearted co-operation such as are ensured only by moderation of statement and emotional constraint. This is not easy, for each belligerent feels his own hurts and is inclined to demand particular reparation for them in preference to the vague aspirations for such international reorganization as is foreshadowed in the proposal for a league of nations after the War. The present absorbing crisis was started by the German note of October 6, itself the immediate consequence of the splendidly successful offensive of the Allied armies under Marshal Foch, begun in the middle of last July. The first German note conveyed a desire to negotiate on the basis of the program enunciated by the President on January 8—the celebrated Fourteen Terms —and requested an immediate armistice, or cessation of fighting. To this the President replied, on October 8, that no armistice was possible unless the Enemy evacuated all the invaded territory. He also asked whether the German Chancellor was speaking for those heretofore responsible for the conduct of the War or for a newly constituted authority in Germany. Four days later, on October 12, the German Secretary for Foreign Affairs declared Germany's readiness to comply with the terms and principles laid down by the President and asserted that the Chancellor spoke with the support of a majority of the Reichstag and in the name of the German people. To this the President replied on October 15, declining to consider an armistice so long as the armed forces of Germany continued their illegal and inhumane methods, and unless satisfactory safeguards were provided for the maintenance of the present military supremacy of the Allies. At the same time, he asked for proofs that the

German government had emerged from the control of arbitrary power. On October 20 the same Secretary of State responded from Berlin by stating that orders had been given to stop the torpedoing of passenger ships, but the acceptance of the condition for the evacuation of occupied territories was obscured by the mention of steps for the safeguarding of the "actual standard of power of both sides in the field;" it was denied that lifeboats with passengers had been purposely destroyed by submarines, and reference was made to plans for altering the constitution of the German empire. To this the President replied promptly, on October 23, reviewing the correspondence and stating that he had transmitted it to the governments of the Allies, asking them to decide whether an armistice should be granted and, if so, on what conditions. He deemed it necessary to say that the German Foreign Secretary, speaking for the Chancellor, had not as yet given proof that "a government responsible to the German people" had been established or that the changes indicated were of a permanent character; therefore he said plainly that the nations of the world could not trust the word of those hitherto the masters of German policy, that the power of the King of Prussia appeared still to be unimpaired, and that the United States could not deal with any but veritable representatives of the German people; finally, that if it must deal with the military masters and monarchical autocrats of Germany, then it demanded not peace negotiations but surrender. Another note is said to be on its way from Berlin, assuring the President that "far-reaching changes" have been made in "the constitutional structure" of Germany, making the military powers subject to civilian control; and that the German government is awaiting proposals for an armistice. Meanwhile Mr. E. M. House, as personal representative of the President, has arrived at Paris, where he is to meet Messrs. Lloyd George and Clemenceau. The military and naval representatives of the United States are preparing to attend a meeting of the Supreme War Council of the Allies at Versailles. Many forecasts of the terms for an armistice have appeared, but they are only unofficial guesses and therefore negligible. We must possess our souls in patience, reposing full reliance in the sagacity of the Council, which, guided by Marshal Foch, knows exactly what the circumstances require. Public utterances in this country, in England, and in France indicate the stern resolve of the Allied nations not to be fooled by German trickery, and, above all, not to allow the German overtures to weaken the purpose or disarrange the plans of the Allies. Undoubtedly the military masters of Germany had hoped to repeat the effects of their peace offensive in 1916, which demoralized the Allies and very nearly led to disaster. So far no convincing changes have been made in the system of government at Berlin, all that has been indicated in the successive German notes amounting only to steps in the desired direction, all of which could be swept aside by the Kaiser, who still remains at the head of the army and navy, of the administration, and therefore still controls the destiny of the German people. The same Secretary of State is in office. One notable change is the omission of the word 'imperial' when designating the government of Germany. The record of the latest Chancellor, Prince Maximilian of Baden, is not one to inspire confidence in his sincerity. Mr. Maximilian Harden, of the 'Zukunft', appears to be the better spokesman for Germany in her distress. The protestations against the charge of inhumane actions and the promise to discontinue them have been followed recently by the exposure of German practices in the cities from which they have been driven and by a large volume of bitter denunciation of the looting, destruction, and savagery—far outside the limits of ordinary warfare—to which Belgium and northern France have been subjected in the course of the German retreat. Of course, it may be difficult suddenly to curb the frightfulness to which the German officers and soldiers have been trained, but it is certain that the persistence in such behavior, in the face of unctuous assurances from Berlin, is having a bad effect on the temper of the Allied peoples. It does seem, however, as if the acceptance of the President's terms represented an acknowledgment of military failure, and a real effort to end the War, so as to prevent the complete consequences of defeat, among which the destruction of the Hohenzollern dynasty stands pre-eminent. There is the crux. The military masters of Germany, with the King of Prussia at their head, will try to save their faces and will hope to the last minute to continue in control of the German government, whereas the President speaks the minds of all the Allies when he insists that the granting of an armistice shall be dependent upon either the unhorsing of the Kaiser and those responsible for the War or a complete surrender of the German armies, as a preliminary to peace. In any event, no negotiations for peace are to be tolerated until the Enemy lays down his arms, for we know well what the alternative means; mere talk while manœuvring for a better military position. The German press has given signs of considering the acceptance of the President's terms as the basis for further negotiations. They will be undeceived shortly. The Allies are acting in unison, without any signs of the slackening of purpose caused by the German peace offensive of 1916. It has been interesting to observe the keen anxiety expressed, as each German note has been published, lest the President should play into the Enemy's hands. It was recognized that he was dealing with an outlaw, and that he might place himself under obligations without obtaining any satisfactory guarantees from a government that had shown no regard for either its contracts or its word. As each note was answered, dexterously, by the President, a sigh of relief could be heard both here and in Europe, and when his last note, concluding with its blunt reference to the King of Prussia and surrender, was published, there was a world-wide gesture of enthusiastic approval. Fears have been expressed that the President might not consult our Allies sufficiently, causing complications thereby, but it may be assumed confidently that each of his notes has been based upon previous consulta-

tion with the representatives of the Allied governments at Washington and upon telegraphic conversation with the heads of these governments in Europe. Now the President, having conducted the diplomatic correspondence to a definite conclusion, has referred the question of an armistice to the supreme military authority of the Allied nations, namely, the Council at Versailles. A decision will come in due course, after proper deliberation, for it is obvious that the Allied military command is in no hurry to cease its successful offensive, whereas the German Headquarters Staff is impatient to call a truce for fear the retreat of its armies should become a real rout. General Ludendorff, the supposed organizer of victory, has resigned, thereby confessing his inability to stem the tide that now is overwhelming the Prussian's vainglorious dream of world-dominion. Not 'dominion' but 'downfall' is the verdict of events. It is clear therefore that we stand on the threshold of a momentous decision. If the German government—whatever it may be—accepts the terms of the armistice to be announced by the Supreme War Council of the Allies, then the War will be at an end and a period of intensely complicated political readjustment is at hand.

The Chrome Scandal

Responding to the initiative of the Californian chrome producers in organizing a protective association, the chrome miners of Oregon have done the same thing. A meeting of more than twenty operators was held at Grants Pass, Oregon, on October 22, resulting in the formation of the Oregon Chrome Producers Association, of which Mr. F. S. Bramwell is permanent chairman, and Mr. O. S. Blanchard, secretary. By unanimous vote affiliation with the Pacific Coast Chrome Producers Association will be effected at once. Thus a solid front will be presented in bringing before the proper authorities at Washington the facts regarding the collapse of the chrome industry. One interesting feature of the conditions that have wrought such financial hardships upon miners in Oregon is that the majority of the deposits being worked by them are relatively low-grade, lying within the limit of the products assigned for use as a refractory material. That limit has been raised from 38 to 43%, and in one instance a special ruling has been made for the benefit of a powerful steel corporation to permit the sale of a cargo of 45% Cuban ore to a maker of refractories. It is interesting to note that a special ruling, explicitly limited to one particular shipment, should have been considered appropriate in order to save a rich corporation from financial loss, but no ruling has yet been made to allow the ore of the poor miners, whose losses mean financial ruin to them, to be purchased by the manufacturers of refractory supplies. On the justifiable plea of a scarcity of chrome the Government fixed a maximum tonnage as well as a maximum grade of ore that might be used for refractory purposes during the current year. The quantity thus allocated is insufficient, and the refractory trade could immediately consume much larger amounts, but the War Industries Board has not permitted the absorption of the ore that is offered. Indeed, much higher-grade ore could be consumed advantageously, but the restrictions as to tonnage and grade remain unchanged, while the miner is being crushed for want of the very market that would take his output if suffered to do so. We do not object to a great steel company being granted permission to dispose of its product at a profit, nor do we protest against a ruling that averts a loss of money, no matter how many millions the beneficiary already may possess, but the discrimination of the War Industries Board in favor of a rich corporation while remaining deaf to the petitions of the poor producers who were urged by the Government to undertake this peculiarly venturesome business as a patriotic duty is a wrong that the Government cannot allow to go unrighted. The statistics of past production show how carefully the miner had left chrome alone; he understood perfectly that our needs could be met by imported ores at a cost lower than was possible here. The Western prospector and miner is not a visionary; he may entertain dreams of some day finding the mine that will reward with riches the years of rough work and constant hardship; that does not prove him unworthy of consideration at Washington, nor does it argue against the good sense of local bankers and capitalists that they assist such men to finance a chrome mine at a time when the country's officials were pleading with them to produce this essential of war. In normal times they would not have financed a chrome mine, nor would they have done it on the hope of increased prices due to war; they did it because they had faith in their Government, faith in the party in power, faith that the committees appointed to attend to the business of providing munitions were amenable to the President who was leading us in a war for democracy and clean government. They have faith in him still, and they do not believe that the Administration, and the public that sustains it, will permit corporate greed to defraud the miner of his rights when once the facts are made known. When it is clearly understood that a little longer delay in recognizing the obligation of the Government toward these men, who risked all they had in producing chrome ore at its behest, will crush them so that they can never resume, and when it is made clear that corporations have accumulated large stocks of ore in order to unload them at exorbitant prices, free from competition, then, we feel assured, public opinion will be aroused to prevent the perpetration of the wrong. These machinations to rob the plain people cannot resist the light; they can flourish only under the cover that shelters oligarchy. This is counter to the spirit of the age, counter to the spirit of the Government, and we may be certain that a Teutonic system of cartels, greedy and grasping, and opposed to the democratic distribution of opportunity, will not be permitted to give the lie to all the fine things we are undertaking to do for the establishment of free and honest government throughout the world. Reform, no less than charity, gains grace by beginning at home.

The Utah Copper Enterprise

The Editor:

Sir—In your third installment of the 'Utah Copper Enterprise' I find much of personal interest to myself, and I desire to call your attention to some matters that in a way will be news to you, but nevertheless facts. In the summer of 1881, while *en route* from Denver to Rosita, Colorado, I took passage on a stage-coach at Canyon City, going to Silver Cliff. My fellow passengers were Henry M. Teller, Capt. J. R. DeLamar, and Edmund Edyvean. Certainly the right combination for a new country: Senator Teller, I was acquainted with, for I had met him in 1868 at the office of Teller & Orahood, Central City. Mr. Edyvean I had met at Dodgeville, Iowa county, Wisconsin, where he was engaged in the smelting business. He had a small Scotch furnace; a number of them were successfully operated in that lead district of Wisconsin. Edyvean introduced me to Captain DeLamar, and I, in turn, introduced them to Senator Teller. General conversation followed and during the all-day ride we became well acquainted. I learned that DeLamar was taking Edyvean to the Terrible mine for the purpose of building a smelter. I became interested at once, and before we reached Silver Cliff, DeLamar invited me to go with them to the mine. This, I understood, was the first mining venture for DeLamar. His associates were the Wahl Bros. of Chicago. The mine was operated at a good profit and when developed sufficiently to warrant a steady production was sold by DeLamar to the Omaha & Grant Smelting & Refining Co., the Captain taking his share of the profits and going to Silver City, Idaho. There he purchased some prospects and opened up the famous DeLamar mine and operated it at a profit and finally sold it to foreign parties.

In 1893 Capt. DeLamar arrived in Durango, Colorado, accompanied by James Healey, a mining man from Nevada. I met him and we proceeded to the Montezuma mine in the La Plata mountains for the purpose of examining the same. Arriving there, I was instructed, first to examine the surface openings scattered over the property. DeLamar and Healey sampled the main incline and drifts. Some hours after, I was instructed to sample the incline and drifts. The Captain and Healey left for Durango and Denver before I completed my work. When I finished my work I had the samples tested at the Durango smelter, wired the returns to the Captain at Denver and heard nothing from him till after he reached New York; when I was informed the results obtained from my sampling corroborated his own work.

In 1894 I received a telegram from him to go to Denver and inquire for a letter of instruction at the office of Pierce & Smith. The instructions were to go to the Cripple Creek district and take samples from any good-looking property that was offered for sale and report my findings to him in New York. I was also instructed to take my samples for assay either to E. E. Burlingame of Denver, or to the works managed by Charles MacNeill at Victor. After taking samples from the Gold Coin mine—then 60 ft. deep—and several other properties, I went to MacNeill's office with my letter of instruction and the samples, and was introduced by MacNeill to D. C. Jackling, assayer and chemist, who made the tests on all the samples I cut in that district.

Returning to Denver, I found letters with instructions to proceed to Salt Lake City, to find A. N. Butts, owner of the Golden Gate mine at Mercur, Utah, examine that property, and send my report to New York. I made a thorough examination, had the samples tested by R. H. Officer & Co., sending duplicates either to Burlingame or MacNeill; telegraphed results to Capt. DeLamar, who wired me he was leaving for San Francisco the next day and would meet me at Salt Lake.

We met there, as per arrangement, and went over the maps and assay-sheets, and the next day proceeded to Mercur. Descending the shaft to the incline, his attention was called to the sample-cuts, which were every five feet alternating on the two sides of the incline and drifts therefrom. In the raises the cuts extended from the incline sunk on the foot-wall the full height of the raise, in several cases 20 to 25 feet. In each cut I had a drill-hole put in and a wooden plug inserted with a tag corresponding to my number on the assay-sheet upon which I had the assay-values plainly marked with the width of each sample-cut.

With a copy of this assay in hand the Captain carefully examined the numbers on the plugs and finally said: "This is excellent work, good sampling, but I will cut some samples to verify the values on the assay-sheet." Spreading the canvas, he personally cut the samples, quartered, sacked, and sealed the sacks, and when a sufficient number had been taken, we returned to Salt Lake and he instructed Officer & Co. to make the tests. While this work was going on, he instructed me to find Mr. Butts, the owner of the mine. I did so, and after the assay-certificates were received, a deal was made for the property, Butts receiving a good substantial payment in cash and a splendid real estate property, worth at least $90,000, located at Boise City, Idaho. I was then ap-

pointed superintendent of the mine and proceeded to open it for production.

I employed Frank Anderson of Salt Lake City to survey the claims and Lee Gilson as assayer. Needing some extra surveying done and Anderson being unable to do it, he sent Robert Gemmell, who did the engineering work for several years. About eight months after the purchase I received a letter from Capt. DeLamar stating that George H. Robinson of Butte City had been appointed general manager of all his Western mining interests; that Robinson would visit Mercur, which he did. After a careful inspection—making no changes in plan or method of development—he questioned me regarding the qualifications of my assayer and stated it would be necessary to have a competent chemist there; that he had one at Butte City and would send him to me. This gentleman, Harry Bacorn, arrived. His work was unsatisfactory to me, and when Robinson arrived one month later, he asked me how I liked the chemist. Plainly, and without knowing he was a relative of Robinson, I told him I preferred to get another man, and stating my reasons, he said: "I hold you responsible for everything going on at this mine. If Bacorn don't suit you, I will find him a place at Tintic." He then asked me if I knew of a good man. I then told him that D. C. Jackling had done considerable work for me at Victor, Colorado, and I believed he would fill the position perfectly; that DeLamar could arrange with MacNeill to have him transferred to Mercur.

Robinson took the address of MacNeill and Jackling and wired DeLamar and in a short time Jackling arrived and took charge of the assaying and chemical department. During this time Colonel Wall came to Mercur and wanted me to interest Capt. DeLamar in the Brickyard mine. I took the matter up with the DeLamar office, then established in the Dooly Block, Salt Lake City, and was instructed to sample the mine. This resulted in its purchase; and shortly after I went with Colonel Wall and made a preliminary sampling of his copper claims in Bingham canyon, now known as the 'Utah Copper.' I spent three days and took my samples to Mercur for treatment. The copper content was very low and the price of copper at that time was about nine cents; consequently no deal was made, but the first knowledge obtained by the DeLamar office was the result of my sampling of the Wall property and nearly two years previous* to the time when the property was offered to our mutual friend, J. W. MacNeill, as stated in your article. When Robinson resigned, H. A. Cohen was appointed manager of the Golden Gate mine. He had previously been serving Capt. DeLamar in some capacity in New York and at the DeLamar mine in Nevada. I, in June, 1897, resigned the superintendency and recommended Duncan MacVichie of Salt Lake to take charge of the property—and I again was placed in the field to obtain another mine—and finally succeeded in bringing about the deal for the Bully Hill copper mine in Shasta county, California, which the Captain purchased, worked, and equipped with smelter, and sold at a profit.

I regard Capt. DeLamar as the best-posted mining capitalist I ever met and he does not belong to that class of mining men who make their money by peddling stock. He believes in getting a property, equipping it with proper machinery, and taking the money from sales of the mining products, proving their merits fully, but he is business-like and always open for an offer on anything he owns. He usually sells to large operating companies and after thorough examination by leading engineers. His experts have covered the entire mining field in quest of desirable properties. I personally examined properties in all the Western States and Territories, Honduras, Mexico, British Columbia, Alaska, and Ontario.

I regret very much that he did not purchase, on my recommendation in 1902, the Hilty claims near the Ollie Oatman spring.

Edward Hilty at that time was the sole resident where the town of Oatman now stands and had locations covering the ground now owned by the United Eastern and Tom Reed mining companies. I had secured the option to purchase for $70,000. I prevailed on one party to take over my option, but lacking sufficient capital to properly develop, the property reverted to the owner. With the Captain's money and management a different story would have been told. I also secured an option on the Gold Road at the same time. This his manager also declined. The production of this mine has probably reached $4,000,000. The Tom Reed and United Eastern have yielded about $7,000,000 to date, and are still producing. These properties should have been under DeLamar control, and would have if he had personally visited the property with me.

GEORGE KISLINGBURY.

Los Angeles, October 21.

*[Mr. Kislingbury is in error; he refers to events in 1895 or 1896; Mr. MacNeill did not become interested in the Utah Copper deal until six years later.—Editor.]

Electrolytic Zinc

The Editor:

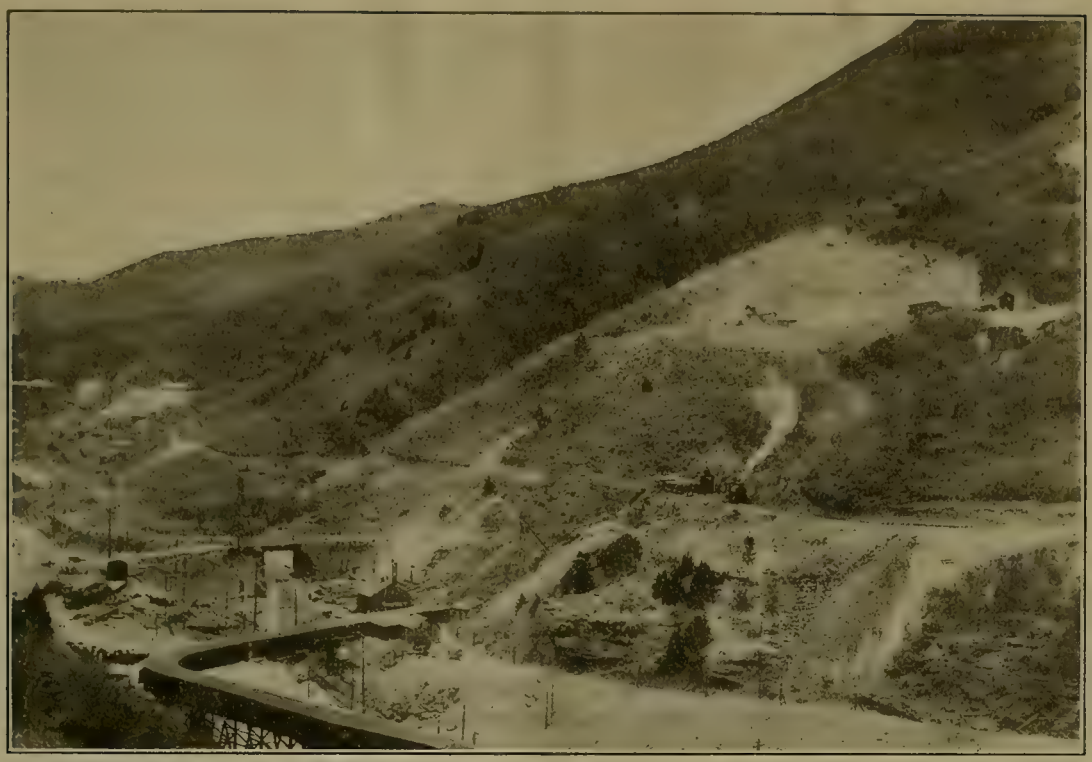
Sir—In your last issue, you credit me with a statement regarding electrolytic zinc. I think that the statement in question was made originally by Mr. French, and that it was quoted by Mr. Yardley during the discussion of my paper on electrolytic zinc at the last meeting of the Institute in Denver. While the statement is not mine, I agree perfectly with the sentiment it expresses.

C. A. HANSEN.

Salt Lake City, October 21.

[This refers to the statement that zinc sulphate only is required for the electrolysis of zinc.—EDITOR.]

MANGANESE acts as a catalyst in the fixation of atmospheric nitrogen by plants through the aid of bacteria. Tests by A. de G. Rocasolano show that the nitrogen-fixing bacteria, grown in pure culture, do not fix nitrogen when manganese is absent. The highest amount of fixed nitrogen is obtained when 0.006% of Mn in available form is present.



THE FIRST STEAM-SHOVEL STARTING TO WORK ON THE WEST SIDE OF BINGHAM CANYON IN AUGUST 1906

The Utah Copper Enterprise—V

Mining Methods

By T. A. RICKARD

The control of Colonel Wall's property passed to Messrs. Penrose, MacNeill, and Jackling, as already related, in the spring of 1903, and the construction of an experimental concentrating plant—the Copperton mill—was begun in August. The extraction of ore underground began in November. These first mining operations by the Utah Copper company had for their primary object the supplying of 300 tons of ore daily to the Copperton mill. Most of this output was obtained from development work and sub-level drifts. At first no particular system was adopted, the ore being simply stoped from the sub-levels in chambers extending up to the 'cap,' which was supported on stulls. When broken the ore was shoveled into cars and trammed to chutes, through which it was delivered to cars on the haulage-levels and trammed to the bins outside. As the capacity of the Copperton mill was increased and an additional tonnage had to be provided, a plan was devised of digging a number of small raises under each pile of broken ore, which was then withdrawn from below and thus moved without shoveling. The sub-levels were driven 25 ft. apart vertically, and later the ore was withdrawn through a system of small raises with numerous branches, which met those of the adjoining raises. The ground between these 'finger' raises was blasted, causing the ore to cave. The caved ore was withdrawn through chutes at the bottom of each raise until the cap-rock began to appear, indicating that all the overlying ore had been tapped. This method has been elaborated at the Inspiration mine, at Miami, Arizona, as described by me in the MINING AND SCIENTIFIC PRESS of September 29, 1917. The method is well defined by George R. Lehman,* who says that it consists "essentially, of undercutting the ore (taking out a horizontal slice), allowing the ore above to cave and crush, and drawing off the crushed ore through small inclined raises, driven under the caved ore, into main inclined raises that lead down to the haulage-drift chutes." The aim, of course, is the

*'Ore-Drawing Tests.' By George R. Lehman. Trans. A. I. M. E., Vol. LV, p. 225.

excavation of ore with the aid of the minimum amount of timbers and explosives, utilizing and controlling the descent of ground that has been induced to cave. The underlying idea is to persuade Nature to do as much of the work of fracturing and moving as is consistent with the safety of the mine and of the men underground.

At the time this method of mining was used at the Utah Copper it was realized that it would entail some admixture of 'cap' with ore, but this was considered to be relatively unimportant, as it was known that the entire orebody was to be stripped subsequently in preparation for digging with steam-shovels, so that the mixing of 'cap' and ore would not cause any serious loss because these two products could be excavated separately by the steam-shovels.

Such was the first mining. All the ore produced up to June 1907 was obtained in this way. Mr. Jackling was general manager; in January 1906 he appointed Mr. Gemmell as general superintendent. He returned from Mexico to accept the appointment, for which he was peculiarly fitted not only by his wide experience in the work of mining but on account of the six years he had spent as engineer in the service of the Santa Fé railroad. In April 1906 he accompanied Mr. Jackling on a visit to the Mesabi range for the purpose of studying methods of mining, more particularly the use of steam-shovels. Among his class-mates at the University of Michigan was William J. Olcott, distinguished among the engineers of the iron country, and to him Mr. Gemmell turned when the time came to select a man to take charge of the steam-shovel work. Mr. Olcott recommended J. D. Shilling, who was engaged in July 1906. Mr. Shilling is now the superintendent of the mine; Mr. Gemmell is general manager for the company, and Mr. Jackling, who is directing the operations of several other mines in Arizona, Montana, Nevada, and New Mexico, is managing director and first vice-president. Mr. Charles M. MacNeill is the president of the company.

The first steam-shovel went to work in August 1906. The chief duty of the steam-shovels was to strip the cap, or overburden, in preparation for the application of an open-cut or terrace system of mining to the ore underneath. At the end of 1909 the ground stripped amounted to 3,232,000 cubic yards. As the cap was removed, it became possible to quarry the ore. The first production by this method was made in March 1907.

Given unlimited money and time, it might have been possible to start the steam-shovels at the top of the mountain and work downward by successive terraces, but mining engineering is allied to business, that is, to the making of money, and it is doubtful whether it would have been economical to do the apparently obvious thing. In the first place, such a method of attack would have necessitated a long delay while the requisite amount of stripping was accomplished and large sums of money would have had to be borrowed, by the sale of securities, in order to finance the operations pending the attainment of profitable production. By starting underground mining, the company was able not only to extract ore forthwith for the Copperton mill but also to extend exploratory work in such a way as to ascertain the limits of the orebody and to develop the ground in preparation for the enormous exploitation that the manager had in view. Moreover, the Utah Copper Company did not own the top of the mountain until, in February 1910, it acquired the property of the Boston Consolidated Mining Co., thereby increasing its area of lode-mining claims to 665.5 acres. The company now owns 830 acres of mining ground. At that time the Arthur mill of the Boston Consolidated also passed into the possession of the Utah Copper, which had previously finished its Magna mill in 1907; so that an enormous tonnage of ore (13,000 tons daily) was demanded. Owing to exigencies of milling capacity it became necessary to continue the shrinkage-caving system on the Boston Consolidated ground, because there was no ore stripped and ready for steam-shoveling in that part of the mountain and steam-shovel operations on the original Utah Copper ground were not sufficiently far advanced to permit of supplying both of the big mills except by aid of underground stoping. Therefore the use of underground mining methods, which had ceased in the original Utah Copper ground on September 17, 1912, was continued in the Boston Consolidated ground until March 31, 1914, by which time the stripping had been so far advanced, and the terraces so well started, as to enable the steam-shovels to supply both mills.

An excellent description of the shrinkage-stoping system as used in the Utah Copper mine is given by T. S. Carnahan in Vol. LIV (1916) of the Transactions of the American Institute of Mining Engineers. The system of mining that was adopted was devised so as not to interfere with the steam-shovel operations, which were foreseen from the start. It was essential, therefore, "that the surface should not be caved, that no large openings be left unfilled, and that the capping should not be mixed with the ore." To accomplish this, the stopes were started from three separate levels or tunnels. The lowest of these served for motor-haulage; the second, 150 ft. higher, was equipped for hand-tramming, as was also the third entry, 100 ft. higher than the second. These levels were connected by manways and by raises for dropping the ore from the upper workings to the motor-haulage level. An underground shaft connected the workings and was used for hoisting supplies, using a compressed-air engine. The connections with the surface were more than sufficient to ensure ventilation. Fig. 1, 2, and 3 are borrowed from Mr. Carnahan's article. He states that it was the custom to divide the orebody in blocks 500 ft. wide and to finish stoping on the top level considerably in advance of the stoping started from the middle level. "In this way the upper stopes were abandoned before the stopes from below began to disturb the tramming-drifts and stope-manways." Likewise the stopes above the middle level were kept well ahead of those started from the main level. During three years, 1911 to 1913 inclusive, 2,824,439 dry tons of ore was drawn from the mine and loaded into railroad-cars at a

cost of 56.6 cents per ton. In addition 102,719 ft. of development yielded 247,280 dry tons at a cost of $4.95 per foot of development, or $2.05 per ton of ore.

Before making systematic preparation for the steam-shovel method of mining, it was deemed advisable to obtain expert advice from the iron regions. In the opinion of the experts the canyon was too narrow and the working-area too limited for the best results from steam-shoveling, but the chief obstacle to this method of removing the ore appeared to be the manner in which the ore-bearing rock would be broken in the course of blasting, namely, in lumps so large that they would have to be reduced mechanically before delivery by the steam-shovel to the cars and bins. Therefore they advised the driving of mill-holes to the surface at intervals of 50 or 75 ft., breaking both the cap and the ore into these raises, for discharging into cars. Mr. Jackling, however, demurred to this opinion and after discussing the matter with Seeley W. Mudd and A. C. Beatty, who were then examining the mine for the Guggenheims, preparatory to their underwriting the bond issue, he went to the Mesabi iron region himself, with Mr. Gemmell, as I have previously stated, in order to get the fullest possible light on the subject. The result of this journey of observation was to confirm Messrs. Jackling and Gemmell in their decision to introduce the use of the steam-shovel as rapidly and completely as circumstances would permit. In the report by Mr. Mudd, dated October 14, 1905, he states: "There seems little reason to doubt the feasibility and desirability of mining with the steam-shovel. This would, of course, necessitate the stripping off and removal of the waste and low-grade surface ore, and this would involve a considerable initial expense, but in the end, this expense would be justified."

shovel method of mining, it was deemed advisable to obtain expert advice from the iron regions. In the opinion of the experts the canyon was too narrow and the working-area too limited for the best results from steam-shoveling, but the chief obstacle to this method of removing the ore appeared to be the manner in which the ore-bearing rock would be broken in the course of blasting, namely, in lumps so large that they would have to be reduced mechanically before delivery by the steam-shovel to the cars and bins. Therefore they advised the driving of mill-holes to the surface at intervals of 50 or 75 ft., breaking both the cap and the ore into these raises, for discharging into cars. Mr. Jackling, however, demurred to this opinion and after discussing the matter with Seeley W. Mudd and A. C. Beatty, who were then examining the mine for the Guggenheims, preparatory to their underwriting the bond issue, he went to the Mesabi iron region himself, with Mr. Gemmell, as I have previously stated, in order to get the fullest possible light on the subject. The result of this journey of observation was to confirm Messrs. Jackling and Gemmell in their decision to introduce the use of the steam-shovel as rapidly and completely as circumstances would permit. In the report by Mr. Mudd, dated October 14, 1905, he states: "There seems little reason to doubt the feasibility and desirability of mining with the steam-shovel. This would, of course, necessitate the stripping off and removal of the waste and low-grade surface ore, and this would involve a considerable initial expense, but in the end, this expense would be justified."

Mr. Mudd gives 94.43 cents per ton, as the cost of mining by the Utah Copper company during the twelve months ending June 30, 1905, and mentions that "the Utah Construction Co., a large firm of railroad contractors, has made a provisional offer to the Utah Copper Co. of 60c. per yard, or 30c. per ton, the contractors agreeing to furnish all equipment and deliver the material not to exceed 2000 ft. from the point at which it is mined. The San Pedro Railroad construction work was done on a basis of 65c. per yard for rock, and most of the material was hauled in carts. Such a price is not abnormal. In the Michigan iron mines, the cost of mining with steam-shovels has been reduced to 12c. per ton or less. . . . Taking all these circumstances into consideration . . . a cost of less than 40c. per yard is

probable, but for the purposes of this estimate, we will assume a cost of 50c. per yard, an average thickness of stripping of 80 ft., and an average thickness of pay-ore beneath to be mined of only 160 ft. On this basis it will be necessary to mine three tons of material to secure two tons of payable ore. Assuming a yard to equal about two tons, the cost of mining would be 37½c. per ton, including the cost of stripping. I believe this figure will be found safe, notwithstanding several unfavorable features which should be considered, but the cost of 40c. per ton will be used in the estimates."

The "unfavorable features" include those recognized by some of the steam-shovel experts, namely, the railroad, county road, and dwellings in the gulch, also the steepness of the hillside, causing the stripping to slide when under-cut, and the probable need of a tunnel in order to reach the deeper ore.

In Mr. Jackling's original report, of 1899, there is more about the metallurgy than the mining of the ore, because, among other reasons, the writer of that report was primarily a metallurgist, but it is worth while to quote his reference to the method of mining to be adopted. He said: "For working the property, it is proposed to build a concentrating plant of 2000 tons daily capacity, and a smelter and refinery of 125 tons daily capacity, near the point of the mountain between Salt Lake City and Garfield Beach, where water is plentiful and railroad facilities good. This point would be connected with the mine by 15 miles of standard gauge railroad. The ore would be worked by quarrying or open-pit methods, the overlying deposits of wash and low-grade material being first stripped off the ore and hauled by railroad to the most convenient dumping-ground. Both the ore and waste would be loaded on cars by steam-shovels. Drilling at the mine would be done with air-drills, for which air would be supplied by a small electric compressor plant, centrally located on the ground." He estimated three tons of 'wash' and eight tons of ore per square foot of surface; the cost of stripping to be 75c. per cubic yard, or 37½c. per ton, so that the cost per ton of ore would be 14 cents. He estimated the cost of mining the ore at 40c. and of hauling it to the mill at Garfield, 15c., making the total cost of stripping, mining, and delivery to the mill 69c. per ton.

Colonel Wall, writing in 1904, in a pamphlet called 'The Mountain Empire, Utah', anticipated that the cost of mining, using the mill-hole method, would be 15c. per ton and that of milling 20c. per ton of ore. He expected the cost of railroad transport, from mine to mill, to be reduced to 5c. per ton. Taking the average copper content of the ore at 2.2%, with 75c. in gold and silver, he anticipated a recovery of 80% and he expected the cost of smelting to be "less than the value of the gold and silver contents."

In 1917, the charge made for stripping against the ore mined during that year was at the rate of 7.5c. per ton of ore; for development, 1.04c. per ton was allowed; while the actual cost of mining was 18.04c. per ton, to which 0.94c. was added for depreciation, 15.99c. for taxes, 1.91c. for insurance, general office expense, legal expense, and salaries. Thus, including stripping, development, and the other necessary charges, the average cost of mining was 45.42 cents per ton of ore. The freightage from the mine to the mills at Garfield represented a cost of 25c. per ton.

(To be Continued)

Engineering Positions in the Army

The U. S. Civil Service Commission calls attention to the following positions in the Construction Division of the Army:

50	Chiefs of survey party	$2700 to $3000
50	Transitmen	2400
25	Levelmen	2100
150	Chainmen	1800
125	Rodmen	1800
50	Topographic draftsmen	2100

Examinations are for men only, except those for draftsmen, which are open to both men and women. All of the positions are exclusively in the field, except the drafting positions, some of which are in the field and some in the office at Washington. The examinations are of the non-assembled type, and competitors will not be assembled for written examination, but will be rated upon their education, training, experience, and physical ability, as shown by their applications and corroborative evidence. Further information, together with the required application blanks, may be obtained from the Secretary of the Twelfth Civil Service District, Room 241, Postoffice building, San Francisco.

THE greatest practical advance in the commercial production of potash from kelp was made during 1915, when the Hercules Powder Co. started the construction of large gasoline-propelled marine kelp-harvesters and a factory near San Diego, California. This equipment was designed primarily for the production of acetone, potash, and iodine from kelp. Kelp as a source of acetone was something new to chemical industry, and chemists all over the world have watched the development of the undertaking with great interest. The plant, since its inception, has increased the number and range of its products, and placed upon the market new materials which are full of industrial promise. Reduced to its simplest terms, the basic principle of this process of kelp-reduction lies in the destruction of the cellular tissue of the kelp-leaf by fermentation, bringing the potash into solution, and producing acetic acid as the product of the fermentation. The acetic acid is neutralized with limestone, giving calcium acetate, potash, and iodides in the solution.

NICKEL ORE is being developed by the Perseverance Nickel Co., composed of Cuban people, at Sierra Prieta, 19 miles north-west of Santo Domingo, in the West Indies. The ore is low-grade, and will be mined by steam-shovels. A 13-mile railway is to be constructed between the mine and the Ozama river.

Sodium Sulphide in Cyanidation

By F. WARTENWEILER

*For a number of years it was a well-established fact in the treatment of ore at the Prestea mine, in the Gold Coast Colony, West Africa, that the carbonaceous schist prematurely precipitated a portion of the gold dissolved by the cyanide solution. This difficulty engaged the serious attention of metallurgists, and the company displayed commendable progressiveness by devoting considerable funds toward research and large-scale experimentation.

The first positive light on the problem was the discovery in 1914 by W. R. Feldtmann[1] that gold precipitated prematurely by charcoal, or by carbonaceous schist, was soluble in a solution of an alkaline mono-sulphide, preferably, for commercial reasons, sodium sulphide. Experiments on Prestea ore at once established the applicability of the discovery. The author was fortunate in having, in 1915, the responsibility of the first practical application of this solvent[2] and then its development into a working process at a later stage.

The ore is a white quartz, brecciated, and seamed with carbonaceous schist, which also occurs as a wall-rock. The gold occurs free and associated with iron pyrite and arsenical and antimonial sulphides. Crushing and grinding are effected respectively with stamps and pans. Amalgamable gold from the raw ore is recovered by the concentrating action of the pans and by pan amalgamation, also by collecting on blankets, by subsequent barrel amalgamation, and by direct pan amalgamation. Wilfley tables are used to separate mineral sulphides. The concentrate is roasted, ground, and amalgamated in pans, and cyanided. Of the concentrate tailing, classified into sand and slime, the sand is cyanided and then treated with the sodium-sulphide process. The application of the same treatment to the slime will be investigated when plant now under construction is at work.

Fig. 1 explains the general scheme of treatment.

The first application of the process was made in the treatment of sand-residue from the cyanide works, the sulphide solution being aded after practically all the cyanide had been displaced by a water-wash. The extraction was normal (equal to laboratory tests), but the total cyanide plus sulphide treatment lasted over an extended period, necessitating the installation of additional vats.

Leaching the sand from the start with a sodium-sulphide cyanide solution did not compare favorably with laboratory tests on account of the difficulty of preserving an efficacious strength of sodium sulphide concurrently with the secondary reaction due to varying quantities of sodium-zinc cyanide (originating in the zinc extractor-boxes) precipitating white zinc sulphide, and with the greater depth of the sand charge to be leached as compared with a laboratory percolation. This depth (6 ft.) made it impracticable to bring solution of the proper strength in contact with all parts of the charge and at the same time obtain an effluent carrying no free sulphide.

FIG. 1

After many experiments the starting-point of the sodium-sulphide solution treatment was finally fixed, and the scheme of operation developed as follows:

(1) A 240-ton charge of sand, after leaching with strong and medium cyanide solution, was at first followed by one-half the usual weak solution and allowed to drain beneath the surface. In the present practice the charge is leached dry before the sulphide is added.

*Abstract of a paper read before the Institution of Mining & Metallurgy, London, on July 25, 1918.

[1]'The Precipitating Action of Carbon in Contact with Auriferous Cyanide Solution,' W. R. Feldtmann. Trans., Vol. XXIV.

[2]Discussion on Feldtmann's paper. Trans., Vol. XXIV, p. 360.

(2) 60 to 70 tons of sodium-sulphide solution is then added and leached continuously.

(3) This treatment is followed by the addition of 100 tons of water-wash; the vat is drained dry and discharged.

(4) The Na_2S stock solution is made up to 0.2% strength by titration with $ZnCl_2$ solution.

The method adds only eight hours to the former cyanide treatment schedule, the sulphide solution taking the place of the second 80 tons of weak cyanide wash. There is no clean definition in the leaching-vat between the cyanide solution and the displacing solution of sodium sulphide; a zone of a mixture of the two gravitates through the sand and is effluent, carrying with it the white precipitate of ZnS. This mixed zone assays as high as 3 dwt. gold per ton, also free cyanide, part of which has been regenerated by the precipitation of the zinc from the sodium-zinc cyanide.

Fig. 2 explains the operation diagrammatically. The detail treatment is illustrated by the following typical log of a sand charge, some two months after the process had been in use on the entire currents and tonnage:

	Assay per ton, shillings
Sand charge, 240 tons	12.0
Residue after Na_2S treatment	3.7
The cyanide residue would be approximately	6.0

After 80 tons of weak cyanide-solution wash had leached beneath the sand-surface, 70 tons of Na_2S solution was added, followed by a water-wash of 100 tons.

			NaCN	Na_2S	Gold per ton	
		October 16		%	s.	d.
(a)		11:00 a.m. Na_2S. On going	0.01	0.29	1	0
(b)	To CN zinc-boxes	12:00 a.m. Effluent solution	0.064	Nil	1	4
(c)		2:30 p.m. Effluent cloudy, with ZnS to by-pass	0.07	Nil	2	0
(d)	To by-pass	4:00 p.m. Effluent	0.092	Nil	4	8
		5:30 p.m. Wash-water added				
(e)	To clarifier	5:45 p.m. Effluent to clarifier	0.058	0.07	10	0
(f)		8:15 p.m. Effluent to strong Cu boxes	0.032	0.17	11	0
		October 17				
		12:00 p.m. Effluent	0.01	0.22	6	2
(g)	To strong sol. Cu boxes	4:00 a.m. Effluent	0.008	0.112	2	6
		8:30 a.m. Effluent to waste-sol. Cu boxes		0.028	2	4
		6:00 a.m. Wash-water all on				
	To waste-sol. Cy boxes	12:00 a.m. Effluent		0.01	0	6
		3:00 p.m. Effluent (last draining)		0.008	0	7

(*a*) The Na_2S strength of stock solution was high in this case (0.29%); it has been reduced to 0.20%, with no difference in extraction.

(*b*) Indicates the strength and assay of the effluent cyanide solution just ahead of the mixed CN·Na_2S zone.

It is noted that the gold value is on the decline. (The maximum gold content of the effluent solution during cyanide treatment is 2s. 6d. per ton.)

(*c*) The beginning of the mixed zone showing ZnS. The Na_2S has been entirely decomposed.

The assay shows the first contact of the gold dissolved by Na_2S.

(*d*) The solution over this period being high in cyanide and containing from nil to a low percentage of Na_2S, but with precipitated ZnS in suspension, is by-passed the precipitating-boxes to the barren strong or medium cyanide-solution sump, raising this sump-solution to approximately 1s. in gold. Any free Na_2S combines with the $Na_2Zn\ CN_4$ of the cyanide-treatment solution, regenerating NaCN with the precipitation of ZnS. Although this effluent contains a certain amount of gold of Na_2S solvent origin, it is precipitated on the zinc shaving with the gold from the gold-cyanide solution, when it reaches the precipitating-boxes.

(*e*) The effluent is still from the mixed zone, high in gold, increasing in Na_2S content, and diminishing in NaCN. It is by-passed to a clarifier (3 ft. depth of sand), where the ZnS is readily left behind; then through the copper-shaving precipitating-boxes, depositing its gold on the CuS; thence it flows to the Na_2S sump or to waste according to its sulphide content.

(*f*) The effluent is now clear and is run direct to the precipitating-boxes; thence to the precipitated Na_2S solution sump to be made up to stock strength.

(*g*) The low Na_2S strength effluent is turned for the remainder of the treatment to the waste-solution precipitating-boxes set apart for this purpose; the box-tailing is run to waste.

Samples of Na_2S residue are frequently re-treated in the laboratory with fresh 0.3% Na_2S solution, as extraction tests. The results of two average tests are:

	Shillings		Shillings
Residue	3.8	Re-treated residue	3.8
Residue	4.0	Re-treated residue	4.0

Before finally arriving at the treatment described, various modifications were on trial and discarded by reason of greater complication with no compensating improvement in extraction. Among these may be mentioned:

1. Saturation of the drained sand-charge with stock Na_2S solution from below the filter.

2. Circulation of the Na_2S solution through the charge by returning the effluent solution over the top of the vat with an air-lift.

3. Starting the Na_2S treatment at all stages of the cyanide treatment.

Referring to the ZnS precipitate settling in the medium cyanide stock-tank, also used as the Na_2S mixed-zone solution by-pass; this precipitate carries but little gold, assaying only 4.3s. after six weeks.

It was ascertained by experiment in the laboratory that the by-passed gold in this sump, from the Na_2S solvent source, is not precipitated in its subsequent leaching passage through the sand charge. The gold brought into solution by the Na_2S is immune from precipitation by carbonaceous schist. This is substantiated by the fact that no gold is precipitated from the Na_2S solution in passing through the clarifying medium composed of sand; assays of solution and assays of clarifier-sand are confirmatory.

The ZnS of the mixed-zone effluent, for all intents and purposes, does not carry gold nor does it act as a precipitant.

The hydrate of lime of the cyanide solutions apparently reacts with the Na_2S and sulphites of the commercial substance used, resulting probably in the formation of calcium hydro-sulphides and calcium sulphides. No

free lime or caustic soda is present in the effluent Na_2S solutions. The decomposition of Na_2S by calcium hydrate appears to be approximately at the rate of:

1 lb. CaO decomposes 0.33 lb. Na_2S.

An incomplete analysis[3] of a working Na_2S effluent solution after one month's operation is here given:

Gold	2s.2d.	Cu	Nil
Na_2S	0.125%	Fe	Trace
KCN	Trace	CaO	Nil
Hg	Nil	*Zn	0.13%

*In suspension as ZnS.

Precipitation of the gold is effected by passing the effluent Na_2S through boxes filled with copper shaving. The boxes are of a design identical with the zinc-shaving extractor-boxes used in the cyanide process. Fresh copper shaving when immersed in the Na_2S solution immediately has its surface coated with a film of CuS, which was first considered to act as a precipitant for the gold. Later experience showed this not strictly correct. Fresh CuS, which had been removed from the surface of the box, proved a poor precipitant of gold from Na_2S solutions, but similar CuS if allowed to remain exposed to the air for a week becomes much more active. Experiments with a small laboratory copper precipitating-box show that the surface of freshly annealed copper is extremely active, and precipitation is good, but that as the deposit of CuS increases in depth, so does the precipitating power of the metal decrease. In this particular case, the normal box-tailing was about 9d. per ton. After one week, the tailing rose to 2s. per ton. The shavings were washed free from adhering CuS and replaced in the box, when the tailing dropped to the original figure. Close contact with the metal is essential.

Very little copper goes into solution; the principal secondary reaction in the boxes is the formation of the copper sulphide. Fresh shavings are added periodically as required, similar to the practice with zinc-boxes. When once well packed with annealed copper-shaving, the boxes are effective without replenishment for a week. Previous clarifying the cloudy mixed solution, the ZnS settled in the copper-boxes and fouled the head compartments. The clean-up of this ZnS-CuS gold precipitate was extremely messy, and zinc persistently hung on throughout the refining, even liquating out of the final copper-gold bar. Clarifying of the solution remedied this trouble.

The average assay of the box-tailing over one month was 3.4d. per ton from an average head assay of 3s. per ton.

As noticed in other Na_2S determinations, there appears to be a decomposition when strong solution is passing through the boxes, and a slight re-generation with solutions weak in sulphide. It is, of course, essential that precipitation be complete in the weak-solution boxes, as the tailing is at present sent to waste.

The copper-boxes in use are:

3 for strong solution of 314 cu. ft.

2 for weak solution of 220 cu. ft.

The average solution precipitated per ton of sand is 0.55 ton, say, 130 tons for a 240-ton charge. The average Na_2S solution passing through the 5 boxes is approximately 330 tons daily on 600 tons of sand, giving

1.6 cu. ft. of shaving for one ton of solution per diem, or

0.62 ton of solution per diem per 1 cu. ft. shaving.

This capacity is considerably less than the zinc-shaving capacity for precipitating auro-cyanide solutions,

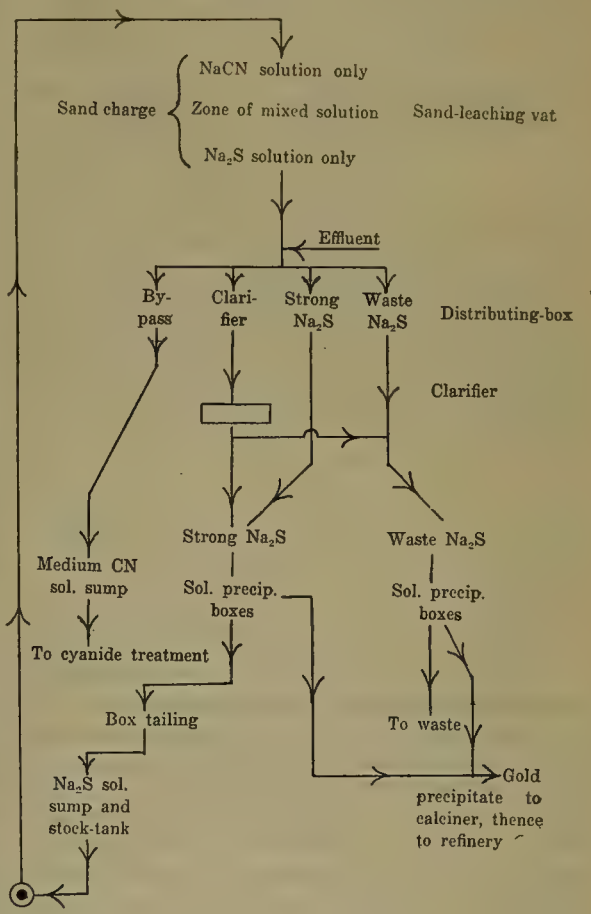

FIG. 2

which at Prestea averages one ton of solution per diem per cubic foot of shaving.

It follows that the Na_2S solution flow must be slower through the precipitating-boxes than is the practice with cyanide solution. This may be due partly to the greater gold content of the sulphide solution.

The copper content of the copper-box tailing is low; analysis of a working solution gave:

	Cu
Strong-solution box-tailing	0.002%
Waste-solution box-tailing	Trace

The clean-up and refining are done as follows:

(*a*) Washing of all shavings in the precipitating-boxes; pumping all the fine to a settling-tank, adding lime. The coarser precipitate, with short copper, from below the screen is handled by buckets direct to the drier.

(*b*) Filter-pressing the fine, after decanting clear water. This is a tedious operation, as the sulphides choke

[3]By A. E. Bidlake, chemist and assayer at Prestea.

the filter-cloths. The mixing of part of the insoluble smelting-flux (charcoal and fine sand) with the thick sludge is found to aid the filtering.

(*c*) Drying of the coarse and fine separately; then screening the coarse through a 14-mesh screen, returning all + 14 mesh (all short copper) to the boxes. Mixing all the dried and screened precipitate.

(*d*) Calcining carefully, with occasional rabbling, in a muffle-furnace until most of the CuS is converted to CuO.

(*e*) Smelting in Morgan fuel-oil tilting crucible-furnaces with a strongly acid flux. The smelting products are:

	Assay		Containing % of total Na_2S gold recovery
	Gold	Copper	
Copper-gold bar	10%	70%	94
Matte	33 oz. per ton	66%	6
Slag	12 oz. per ton	2%	

At first, the calcined precipitate (*d*) was treated with hot sulphuric acid, but with indifferent results, owing to the absence of an oxidizer to dissolve the considerable metallic copper present. The sulphate solutions were passed through precipitating-boxes filled with iron. The acid treatment was soon discontinued.

The flux used in smelting (*e*) the calcined precipitate is:

Roasted precipitate	100
Borax	100
Sodium carbonate	20
Silica	50
Assay-slag	50
Charcoal	8

Assay of a typical calcined precipitate is:

	%
Gold	2.37
Copper	32.70

We melted at a low temperature until the violent action had pretty well ceased, then at high heat for about 15 minutes. The crucible charges were poured into the usual conical molds, the buttons hammered off, and the matte separated from the copper-gold alloy in which the gold is concentrated. A final re-melt was made of all the matte and of the copper-gold buttons in a small furnace. Fortunately the matte and slag carry but a small proportion of gold. Both these are ground up for shipment to a smelter. It is generally a good plan to run small-scale preliminaries in the assay-furnace, to determine fluxing. The large melt is easier than in the assay-furnace on account of mass action and greater heat. A reverberatory-hearth furnace has been considered to replace the comparatively small crucibles. For commercial reasons it was found to be of greater advantage to sell the calcined precipitate direct to a smelter, receiving payment for both gold and copper content. The melting at the mine was therefore discontinued.

An analysis (by Mr. Bidlake) of a copper-gold bar is shown:

	%		%
Gold	10.45	Iron	Trace
Silver	0.39	Aluminum	Trace
Copper	71.50	Insoluble	4.00
Zinc	2.70	Not determined	10.96
Lead	Trace		
			100.00

The insoluble matter was a mixture of sulphur and carbon.

The presence of arsenic was suspected, but failed to be confirmed.

Metallic copper in the form of a sponge, while precipitating the gold from the Na_2S solutions, decomposes the solution, forming a slimy mass of sulphides unfit for filtration. Copper oxide acts in a similar manner.

The copper shavings are turned in a lathe from an annealed cylindrical ingot of copper which has been bored to admit the mandrel. The thickness is approximately 1/500 in., and the maximum width $\frac{1}{4}$ in.; observed against the light, the broad side of a shaving has the appearance of a fine web. In the cutting the shaving becomes brittle, and it is important that it be well annealed before use. This is done by heating to red heat in a muffle, withdrawing and immersing in water. A scale of copper oxide is formed during the annealing; most of this is loosened and falls off in the water-cooling bath, and can be recovered by reduction to metallic copper in the smelting-furnace.

The copper oxide so formed is about 1.3% of the total weight of copper shaving annealed. Shavings have been turned successfully with a standard lathe by native labor.

The sulphide solutions are assayed for gold by the usual methods, namely, the lead-zinc sponge method in the presence of HCl followed by crucible fusion, or the $CuSO_4$ method commonly used on the Rand.

The available Na_2S is determined by titration with a standard $ZnCl_2$ solution. The method is based on the conversion of the zinc chloride to zinc sulphide. Nitroprusside of sodium is used as an outside indicator. For convenience to the shiftman the $ZnCl_2$ solution strength is correlative to the silver-nitrate solution used in the cyanide titration. The method is well adapted for works use, the end point being definite.

The iodine method with starch indicator has been on trial with the view to using as an inside indicator. It was, however, unreliable on working solutions, although fairly accurate on solutions freshly made.

The extra extraction on a sand charge by sodium-sulphide treatment depends on the comminution of the sand, the gold-value, and the amount of graphitic schist. On average, the new process accounts for an additional extraction at Prestea of 2s. per ton of sand treated.

The consumption of the Na_2S is, over a period of several months, 1.2 lb. per ton of sand treated. The actual copper lost (after crediting copper recovered in the clean-up) is not over 0.13 lb. per ton of sand treated. The available Na_2S in commercial sodium sulphide varies between 64 and 55%.

The gold produced by the process over a period of 24 months was £39,448, from 394,864 tons treated at 2s. per ton.

In connection with precipitation, the copper-shaving method was thought from the start to leave room for improvement; the desideratum being a method permitting a simpler clean-up and the recovery of the gold in bar form, comparable in fineness with cyanide gold. With this in view, extensive laboratory and small tests were made by Mr. Bidlake, with electrolytic precipitation. Results were promising when a simple method was discovered of precipitating the gold in the desired form on aluminum shaving or on an alloy of aluminum and zinc. This method awaits favorable market conditions for its

large-scale application in substitution of copper shaving, which meanwhile is playing a useful pioneer part.

PRECIPITATION ON ALUMINUM. The result of these tests may be summarized:

Pure aluminum is highly efficient but is too easily soluble in strong Na_2S solutions, giving rise to violent action in the box, and a waste of metal. An alloy consisting of 50% Al with 50% Zn is better, it stands up well under the solution, and produces a rich precipitate in the head compartments. The deposition of gold on the shaving provided some interesting features.

The alloy was almost entirely replaced by metallic gold alloyed with copper. A portion was treated with 15% H_2SO_4 to dissolve the remaining base, and yielded skeletons of reddish-yellow metal in shape closely conforming to that of the original shaving. This was melted with borax and the bullion assayed.

	%		%
Gold	75.5	Iron	Trace
Copper	21.0	Undetermined	2.0
Zinc	1.5		
Aluminum	Trace		100.0

The final working-test was made with a small 7-compartment box fed with ordinary main-plant working solutions. Our supply of aluminum being limited, and it was possible to fill four compartments only. The alloy consisted of 25% Al and 75% Zn. With this, excellent results were obtained over a continuous run of 41 days. About 450 tons of mixed Na_2S solutions passed through the box in this time.

Average assay-value:

Heading ..... 5.5s. Tailing ..... 0.5s.

During this period the box was not dressed or the shaving handled in any way, yet the precipitation was good right up to the end. At that time a great deal of trouble was experienced with ZnS, and the solutions were never quite free from suspended matter. Naturally the clean-up was a messy affair, but eventually gold was obtained 805 fine.

The precipitating power of this alloy appears to be more than double that of copper; 450 tons of solution through 4 cubic feet in 41 days is a good performance.

The author is deeply indebted to P. R. Nethersole and A. E. Bidlake for the additional information afforded by them in the light of their later experience, which has been embodied in the paper.

GRAVIMETRIC determination of potassium by sodium cobaltinitrite is outlined by C. V. Garola and V. Braun in the 'Journal of the Society of Chemical Industries,' as follows: The solution of the potassium salt, containing about 0.25 gm. KCl, and free from other bases except Na, is evaporated to 25 cc. and treated with 25 cc. of sodium cobaltinitrite solution consisting of $Co(NO_3)_26H_2O_3$, 28.6 gm., glacial acetic acid 50 cc., $NaNO_2$ 180 gm., and H_2O to make 1000 cc. After 18 hours the precipitate is collected, washed with 10% AcOH, then once with 95% EtOH, dried at 100°, and weighed. The weight is multiplied by 0.2074 to obtain the quantity of K_2O present. The method is accurate.

Roasting Sulpho-Telluride Gold Ore

In a paper on 'Roasting for Amalgamation and Cyaniding Cripple Creek Sulpho-telluride Gold Ores,' presented by A. L. Blomfield and J. M. Trott at the Colorado meeting of the A. I. M. E., the practice followed in the Golden Cycle mill at Colorado Springs was outlined. The Edwards duplex roasting furnaces are used, and the capacity of each furnace ranges from 80 to 150 tons per diem of 24 hours, the higher capacity being obtained with ore containing more than 2% lime (CaO). The sulphur content of the ores is approximately 1.8%. The crushing previous to roasting is done in ball-mills giving a product of which 46% lies between $\frac{1}{8}$ in. and 20 mesh, 57% of the discharge being coarser than 20 mesh. Coarse material does not roast sufficiently well, leaving soluble sulphides, which increase the consumption of cyanide. The roasting temperatures range from 800° to 900°C., the higher heat being desirable with high lime content. The chemical reactions are given as follows:

SILICIOUS ORES. $FeS_2 + \text{heat} = FeS + S$.

$FeS + \text{heat} + O = FeO + SO_2$.

FeO may further oxidize to Fe_2O_3.

$FeSO_4$ is found when roasting at low temperatures, but at high temperatures this decomposes into FeO and SO_3 or $SO_2 + O$.

BASIC ORES. In the roasting of calcareous ores containing metallic sulphides, if sufficient sulphur be present the lime is converted almost quantitatively into $CaSO_4$. The behavior of $CaSO_4$, when heated in the presence of CO and C, has been investigated by H. O. Hofman and W. Mostowitsch.* The chemical reactions and temperatures stated herein are quite largely taken from their reports. They are given, as they appear to fit the class of high-lime ores as roasted. The reduction of $CaSO_4$ by CO is indicated in the equation $CaSO_4 + 4CO = CaS + 4CO_2$. The reaction takes place without any loss of sulphur. Very little reaction takes place unless the temperature is above 680°C. Between 750° and 850°C. the action is quite rapid and is completed at 900°C. The reduction of $CaSO_4$ by carbon is indicated in the equations $CaSO_4 + 4C = CaS + 4CO$, and $CaSO_4 + 2C = CaS + 2CO_2$. The action begins fairly well at 700°C. and finishes at 1000°C., proceeding most rapidly between 800° and 900°C. At about 800°C., $CaSO_4 + 2C = CaS + 2CO_2$; above 800°C., $CaSO_4 + 4C = CaS + 4CO$. It was found that CO acted more readily and effectively than carbon alone, both beginning and finishing at lower temperatures. It is probable that the gases CH_4, C_2H_6, and H would act similarly in the reduction of $CaSO_4$, since they are effective with Na_2SO_4.

CaS, if roasted in pure dry air, does not all revert to $CaSO_4$, but forms a product of about 76% $CaSO_4$ and 24% CaO, with a loss of approximately 32% S. This

*Trans. A. I. M. E. (1910), Vol. 41, page 763.

loss of S is accounted for by the interaction of $CaSO_4$ and CaS, according to the reaction $3CaSO_4 + CaS = 4CaO + 4SO_2$.

The complete elimination of sulphur at this point is probably prevented by the failure of intimate contact between the CaS and $CaSO_4$ and the formation of CaO between the $CaSO_4$ and CaS. Action between $CaSO_4$ and CaS takes place in a neutral or oxidizing atmosphere, but not in a reducing one. When heating pure $CaSO_4$ in the presence of oxygen it loses its combined water at 900°C. and begins to decompose at 1250° to 1300°C. In the presence of SiO_2 it starts to decompose and gives off SO_2 at 1000°C. and decomposition is completed at 1250° to 1300°C. The action is shown in the equation $CaSO_4 + SiO_2 = CaSiO_3 + SO_2 + O$.

Roasting for Cyanide Treatment. In roasting for cyanide treatment, both sulphates and soluble sulphides are deleterious. Soluble sulphides are active cyanicides and attack zinc freely. They are active reducing agents and under certain conditions can completely eliminate all oxygen from the solutions. Though precipitating gold to an appreciable extent only in acid solution, when the solution percolating a leaching-charge becomes deoxidized by an excess of soluble sulphide; either gold is precipitated or the undissolved gold is so coated as to render further dissolution so extremely slow that to obtain a commercially good residue is impossible. In agitating slime, especially without air, a similar condition is brought about. It is interesting to note that if such a residue is completely dried or thoroughly treated with a solution of permanganate of potash or other effective soluble oxidizer, then subjected to cyanide treatment, the normal residue is obtained rapidly. Acid sulphates act as virulent cyanicides if not quickly neutralized. Calcium sulphate, formed either in the roasters or by the reaction of soluble sulphates in the ore on meeting the lime in solution, is decidedly deleterious. The hot ore warms the crushing solution. This becomes saturated with calcium sulphate and precipitates as the solution cools. These crystals fill pipes, launders, and Dorr thickeners, render filter-mats and clarifying-mats impermeable, coat Merrill filters, frames and cloths, and form a deposit on the zinc and zinc-boxes. We believe that the chief formation of soluble calcium sulphate, with high-lime ores, occurs in the roasters. It will be noted in the roaster equations quoted that, somewhere above 870°C., the final molecule of water is driven out of the calcium sulphate; it then becomes practically insoluble in working-solutions and does not form a cement in the sand-tanks. For illustration, a ton of deposited calcium-sulphate crystals and slime, if fed slowly or rapidly into the chilean mills, forms a band of cement sand in the leaching-vats and re-deposits throughout the plant. If, however, 10 tons of this material is fed into the comminuters and thence through the roasters, meeting a heat of 870° C. or higher, it cannot be noticed in the cyanide plant. It is commercially possible to roast ores so that they may be treated with the ease of a free-cyaniding raw ore; this is what we call an 'over-roast.' Such ore can be extracted to a finished residue in a good standard cyanide plant. Chemical consumption is held at a minimum. Standard classification is sufficient and no change of solution is necessary. Solution is rapid and reaches a definite end-point, but the roast is decidedly more expensive, and the final residue much richer than that now obtained. The slime-residues show even greater difference in gold content due to over-roasting. Having found that a better residue could be obtained by a cheaper and less complete roast, it was decided to attempt a more efficient treatment by more delicate roasting. This required a quick method of chemical testing and the use of pyrometers to help regulate the temperature of each roaster continuously.

A Permanent File for Mining Records

The exigencies of the War have brought out the necessity of having in Washington a permanent file containing detailed information relating to mines and mining companies, information that is not now available in any library but is needed by the Government in solving many problems relating to the betterment of the mineral industries. The U. S. Bureau of Mines, therefore, has undertaken the establishment of a file in which it intends to place not only data published in the annual reports of directors or mine-managers to stockholders, but also reports of consulting engineers and the information supplied by mining companies in reply to questionnaires submitted to them. The reports of consulting engineers and any mining reports that the author or the operator wishes to have considered confidential will be so regarded; those that may be published later will bear a stipulated release-date such as the author or operator may indicate. In order that this information may be collected as rapidly as possible the Bureau of Mines invites mine operators, consulting engineers, and others to forward copies of reports that they may make on any mining property, these reports to be filed permanently with the bureau at Washington. Also the bureau asks all mining companies that issue an annual report to kindly favor the bureau with a copy for its files.

A firebrick cement, for which saving in time of laying the bricks and long life of the joints are claimed, has been placed on the market under the trade name of 'amalgam.' The bricks are merely dipped in the cement. This does away with the usual buttering or covering of the bricks before they are laid. When used as a lining it is claimed that the covering of the lining bricks with the cement results in an increased life of the brick.

Nitric-acid plants in operation, and those nearing completion in this country, will possess a total capacity of 650,000 tons made from sodium nitrate and 225,000 tons from the oxidation of ammonia.

Technical students at German schools during the summer of 1918 totaled 4393, against 13,000 to 14,000 in normal times.

Mining in Russia

By HERBERT C. WOOLMER

Before the revolution in Russia, mining operations had been carried out on lines somewhat different from those in other countries, the reason for which it is not difficult to understand when it is realized that, in such a vast and undeveloped country, mining centres often arise in places entirely devoid of population.

TRAVELING IN SIBERIA

In order to obtain the labor necessary, these mining enterprises have been compelled (in addition to opening up the mines and equipping them with all necessary plant, machinery, and equipment) to construct complete villages for their employees. In addition to money spent on this, large sums have often to be spent in improving ways of communication to the nearest rail-head.

The erection of a village, or in many cases, of villages, calls for the further erection of churches, hospitals, schools, police barracks, stables, farms, flour-mills, shops, and stores for food, clothing, and other supplies, which, in their turn necessitate a further erection of buildings for the housing of the doctors, nurses, police, storeman, and millers. During the last few years the Russian laws have been considerably altered and amplified in connection with the administration of large industrial and mining concerns, and for each property a district Government inspector investigates, in detail, all the conditions of the peoples' livelihood. These Government inspectors had under their jurisdiction the fixing of wages for the work-people, their housing, education, medical treatment, accidents, etc., and during the last few years the laws were being enforced with much greater exaction; in fact, the workmen were living under conditions far above those in large towns or in the villages from which most of the labor came. Mining companies in general fully understood that in order to obtain satisfactory work from their employees it was necessary to make the general conditions of living as satisfactory as possible.

The pricing of goods in the shops run by the companies had to receive the inspector's sanction, but this was apt to cause a certain amount of discontent, although the companies were usually quite satisfied to make the expenditure, relying upon their profit from the output of the mines themselves. In English-speaking countries the law does not permit companies to carry on trade relationship with their men, but in Russia it is obligatory, and in the past this has been a wise arrangement, in that the companies run their trading establishments on economical and business lines, thus preventing outside traders from exploiting the work-people by selling to them goods at exorbitant prices.

When the revolution took place, one of the first things that the Workmens' and Soldiers' delegates instructed their representatives to demand, was the right to control all these various undertakings, and the experience of one English company, controlling large anthracite mines, in the Donetz district of South Russia, may be of interest:

IRON MINES NEAR KYSHTIM

In June 1917 the employees of this company applied to the local management to form their shops into a co-operative association, to be controlled by a committee

elected by the workmen on the property. They protested against the company making any profit out of the workmen under this heading, and, in fact, against their controlling establishments of this description at all. To start with, arrangements were proposed, and agreed to, between the company and the men, whereby the latter subscribed a certain amount of capital to cover the cost of a portion of the stocks and material, and the balance was taken over by the committee, with a promise to pay to the company on the valuation as and when funds became available. In like manner, committees elected by workmen sprang up on every hand. A committee was formed to supervise the running of the hospital, another to supervise the up-keep and repairs of dwellings, a third for transport arrangements, and also again for the control of the schools, sanitation, and the like, the payments for which was still to come from the company's pocket. Soon after these various concerns had been taken over, a demand was made that the workmen should appoint delegates to discuss with the manager the working of the mine, and soon after they demanded a right to investigate the accounts and books of the company, so that they might know what profits were being made, which would be a just reason (in their eyes) to press for a higher rate of wages all round, which, by the way, was being raised little by little almost every week.

Naturally, as the weeks went by, these conditions got more and more difficult. Many of the demands made by the miners and workmen were such that, if accepted, they would ruin the enterprise, and it greatly depended upon how the manager handled the various questions as to what might be the after-effect. To quote an instance of how careful one had to be: On one neighboring property the manager was beaten to death, and on another he was wheeled to the station some miles away in a wheelbarrow deliberately smeared with thick oil and manure.

On our mine, in order to check and control the demands made by the work-people, and in view of the Russian love for committees of all kinds, a new committee was formed by myself, which was called the Directors Committee, on which were nominated various members who were reliable men, and at the same time were on some of the various committees already appointed by the work-people. This committee was formed to assist the administration, which would refer to it, when necessary, any question that the local committee brought forward, the aim being to come into close contact with them and thus prevent outrageous demands being forwarded direct from them to the manager. This arrangement worked satisfactorily, as the members constituting the Directors Committee, acted as a check on the local and sub-committees, as they did not wish impossible demands to be made by them, which would have to be again discussed by the Directors Committee, of which they were also members.

In addition to myself, two other English members, namely, the mine-superintendent and the chief book-keeper, were on the Directors Committee, and in this way a satisfactory relationship was maintained until December 1917, at which period the work-people were further stirred up through outside influence, and many of the old committee-men were replaced by others having still stronger Bolshevik tendencies. Early in 1918 the chief book-keeper was arrested for several days, and finally he and the manager had to leave the property and seek safety at Kharkoff.

During all this time a small output of coal was being maintained and sold to railways or large works direct. The price had been going up month by month, until in December 1917 it reached the high figure of 60 to 70 shillings (or $17) per ton at the colliery. A little work was still carried out by the miners, who were receiving instead of the normal R1.50 per shift, R10, or more, and were still dissatisfied. All stocks and stores were difficult to procure, while communication by railway was almost entirely suspended. Fighting between Bolsheviks and Cossacks had been going on intermittently during February and March, until gradually a German penetration took place and a German commandant was appointed to control the district. Conditions then began to improve somewhat, and the manager and book-keeper were able to return to the mine in March 1918, the property having been managed in the meantime by the Russian under-ground-manager.

The district was in the hands of the Bolsheviks from January to April, after which time it was controlled by the Germans through the above mentioned German commandant and a few hundred German soldiers. Most of the mines, especially the anthracite ones, ceased work, and the shafts have been inundated with water. Austrian prisoners, who were working in our mine, left on the arrival of the Germans, while the younger of the Russian workmen enlisted in the Bolshevik army, leaving only old workmen, most of them family-men, to stay with the company. Though the district was practically run by the Germans, they did not, at first, interfere with business or internal affairs. Most of the mines in the coal district suffered heavily, not only in the destruction of plant, machinery, etc., and loss of workmen, but more especially by allowing the water to rise in the workings.

At the end of June, however, the German commandant of the district invited the three British members of the staff resident on the property to call and see him, saying he did not intend to interfere with their work, and that they could return with the messenger in his car to make his acquaintance. This invitation they could hardly refuse to accept, and set out to call on him, but on arrival at his office they were immediately imprisoned in very dirty quarters, and the Commandant did not even give them the opportunity of discussing matters with him. Next day they were entrained and sent under guard out of the Don country, straight through to Germany, where they are now lodged (according to information received through Copenhagen at the end of August last) at the civilian camp at Rhuleben.

This affords another instance of the Hun's duplicity and deceit, first by inducing these three Englishmen to go and see him under a false pretense of security, and contrary to international law.

Silver Mining Prospects in Ontario

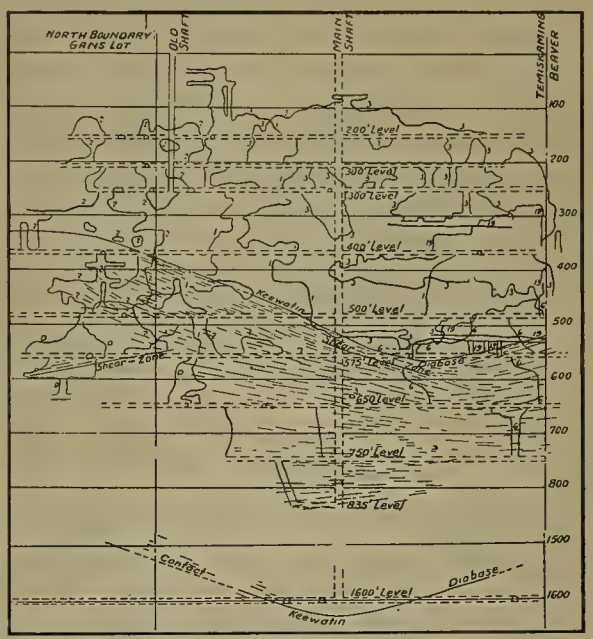
By KIRBY THOMAS

The discovery and development of new silver deposits in Ontario, particularly in the Cobalt district and in the geologically related areas, has not for several years kept pace with the decadence and exhaustion of the productive mines. The disclosure of new veins or of extensions of the ore-shoots in the known veins in the older properties, as at the Kerr Lake and Temiskaming mines, or the Seneca-Superior vein in the Nipissing territory, have enhanced the output of the district materially and the general introduction of improved milling methods, with flotation and cyanidation, to the treatment of the low-grade ore, and the fills, dumps, and tailing piles, has prolonged the period of large production much longer than was to be expected in default of successful results from general explorations during the past five years.

At Cobalt itself, in the Coleman and adjacent townships, where the first discoveries were made, this exploratory work has been most intensive. Without particularizing, the general results may be reported as disappointing. Several of the earlier large producers, like the La Rose and the Crown Reserve, have practically closed down. Most of the other profitable companies have adopted a definite policy of spending their funds available for exploration and speculation in other and remote districts. In some cases these companies have desisted from exploring fairly promising ground that belonged to them. During the past two years several of the producing companies have united to employ a geologist to aid them in exploration. It is difficult to measure the direct results of this policy, for as the saying goes, if the ore is found the superintendent or the mine-boss claims credit, and if it is not the expert is "put over the ropes." However, one indirect result has been a thorough and detailed study of the unique distribution of ore in the district, the data and results from which are now available in the reports and articles by Alfred R. Whitman, of California, the geologist engaged for this work.

The explorations made at the King Edward mine and by the Beaver and Temiskaming companies to determine the possibilities of the lower contact-zone of the diabase sill are recent features of local mining development. Deep shafts, 900 to 1200 ft., were sunk to reach a geological objective, first theoretically assumed and then determined by diamond-drilling. The results were geologically a success but commercially unsatisfactory. It is not likely that any of the companies will find courage to undertake such 'long shot' explorations in the face of the indifferent results. The Nipissing company, by unique hydraulic operations, has swept whole hills clean to find outcrops of the veins, and with good results. This wholesale 'trenching' proved justifiable in the Nipissing territory, but the method is not applicable in all parts of the district so there remain large areas in which there are possibilities of outcrops being found.

The most active new exploratory work is under way in two widely separated and geologically different parts of the Cobalt district. In the south-west, the Adanac and other companies are testing the upper Keewatin-diabase contact-zone following strong veins filled with the minerals associated with the silver, namely, the cobalt and nickel arsenides. In a general way this area is attractive



TEMISKAMING MINE, COBALT, ONTARIO. NORTHEAST-SOUTHWEST SECTION PARALLEL TO MAIN VEIN SYSTEM

and some of the present undertakings are likely to repeat the Beaver-Temiskaming record of more than 12,000,000 oz. of silver. The other explorations are in the northwestern part of the district. One, the Genessee, is exploring in conglomerate; and the other work, being done by the Mining Corporation of Canada, is in diabase formation along the Devils Point northwest-southeast fault. These are both important undertakings and the outcome will be watched with interest. The Genessee is following mineralized veins in the Nipissing conglomerate to the contact with the Temiskaming conglomerate and exploring the zones of lateral shearing in relation to these veins in the hope of picking up extensions or duplications of the deep ore in the neighboring properties south-eastward. Cobalt needs a new and startling find to arouse

its operators and outsiders to possibilities as yet unexploited.

In the outlying districts there has been but one notable success in recent years. This is at Gowganda district in the Miller Lake-O'Brien mine. After several years of extensive exploration, with only indifferent results and after the operations by the De Lamar crowd on adjacent property had been practically abandoned, this mine came into bonanza. A vein with native silver and the characteristic associated minerals, 14 inches thick and yielding in car-lots from 2000 to 10,000 oz. per ton, was cut on the diabase about 200 ft. below the contact with the Keewatin formation. Last year a production of 2,000,000 oz. was attained and the probable reserves are estimated at 10,000,000 oz. The result of this strike was the revival of exploratory work in the district, notably in the Miller Lake vicinity. Several companies are developing and there is promise of success for some of them. Other explorations in the Gowganda district have been on the west side of Gowganda lake on the Mann ridge, where there is a defined and extensive diabase area with innumerable characteristic veins from which several finds of moderate size have been recorded. The district is hampered by lack of power and by transportation difficulties from 'the end of the steel' at Elk Lake, 30 miles distant. It is probable that more work will be done in this district and that the results as a whole will prove satisfactory.

In the Elk Lake and Montreal River districts no work is being done, notwithstanding promising conditions in several areas. This is partly due to the financial limitations of the companies interested. It will take a general boom to revive justifiable activity in these two districts.

At the important Casey-Cobalt mine, north of Cobalt, systematic and extensive exploration by drilling has failed to disclose any extensions of the rich veins in this isolated property. South of Coleman township in the Gillies Limit and on Nett and White Bear lakes, several local discoveries have been announced from time to time, but they did not prove to be such as to induce laggard capital to undertake exploitation at this time.

In the South Lorrain district only two serious operations have been under way recently, the Big Keeley and the Wettlaufer-Curry properties. The former, owned by an Australian-British company, has suspended promising development owing to the War, and is only stoping a limited block of ore. Two separate attempts to find more ore on the Wettlaufer mine, which has a record of several millions of ounces, has been discontinued, and it is probable that the demise of this spectacular operation will soon be recorded. The extensive exploration campaign on the adjoining Curry lot has been generally disappointing, and the work may be discontinued. There are several promising properties in this district that need the stimulus boom or a local strike to attract the requisite capital to test them.

The Ontario silver districts will yet yield some spectacular and sensational mines, but the interest and incentive to extensive exploration work has been declining for some time, and can only be revived by new, and probably accidental, strikes such as may come from the continued activities of prospectors and the 'bush-boys', who ever hope to repeat the La Rose-Nipissing episode of an earlier decade.

The Temiskaming Mining Co. has issued a special report to shareholders, containing the reports of the company's consulting engineer, R. J. Ennis, and mine manager, I. S. McReavy, also one by A. R. Whitman on geologic conditions. The report is accompanied by a number of plans.

Mr. Ennis states that as ore-reserves were exhausted in April, 1918, and only a few points were yielding ore, the mill was stopped and all machines put on exploration. From 1908 to 1913, inclusive, 142,818 tons of ore yielded an average of 50.2 oz. per ton, while from 1914 to 1917, inclusive, 91,595 tons averaged 40 oz. per ton. The total was 10,837,919 oz. Development necessary for this output amounted to 39,503 ft. On the levels above the diabase sill within this area, and on the 575, 650, and 725-ft. levels in the diabase, 38,000 ft. was driven, thoroughly prospecting the ground.

Mr. McReavy's report covered the period January 1 to June 30, 1918. He reviews the reports of Balmer Neilly and Douglas Mutch, who examined the mine during the dispute under the previous management. Their estimates were practically correct. During this half-year the mill treated 11,759 tons of ore, yielding 391,368 oz. Development amounted to 1496 ft. Tailing available for treatment is under 70,000 tons, containing up to 300,000 oz. of silver.

Mr. Whitman's geologic report states that there are three unexplored areas on the property in which there are reasonable possibilities of finding ore. The most important is on the 500-ft. level of the Gans lot. The driving of a 280-ft. cross-cut is justifiable. The second area is that between No. 3 and 19 veins, on the 500-ft. level. A small orebody might be cut within 100 ft. of No. 19. The third area is on the 1600-ft. level. Here, there is a reasonable possibility of finding ore. The south-west cross-cut exposes a strong calcite vein in Keewatin formation, which arches up into the lower surface of the diabase, as the veins in the Temiskaming and Beaver mines belong to the same system, and ore should be found. This exploratory campaign will be finished about New Year. The map on the foregoing page shows the workings of the Temiskaming mine.

SPANISH MINERAL EXPORTS for the first half of the current and past two years are as under, converted from pesetas to dollars:

	1918	1917	1916
Copper:			
Blister	$2,115,180	$2,597,540	$2,426,400
Ore	24,030	100,980	99,400
Regulus	1,643,490	1,759,560	1,342,200
Iron ore	6,363,610	6,264,500	5,206,000
Pyrite	2,323,080	2,901,800	4,012,600
Lead:			
Argentiferous	1,035,180	1,237,720	869,000
Other	5,697,540	5,387,140	6,412,000
Quicksilver	571,590	210,100	1,267,000

On the average price ($116) of mercury for the first half of 1918, Spain exported 4920 flasks, considerably more than in 1917, but much less than in 1916.

ADVENT BAY, SPITZBERGEN

Spitzbergen

A recent cablegram from London stated that the German holdings on Spitzbergen had been seized for the Allies by a British naval unit and reference was made to the fact that this island belongs to no country—it is a *terra nullius,* or 'no man's land'. Some of our readers are aware that Spitzbergen boasts deposits of excellent coal that have been exploited for about ten years by John M. Longyear, of Lansing, Michigan, in the name of the Arctic Coal Co., which was producing 70,000 tons per annum just before the War. This product was sold at the Scandinavian and Baltic ports, but it represented a precarious trade. The inability to deliver coal to Russian and German ports, together with the abnormal increase in the value of the ships operated by the Arctic Coal Co., led to a sale of the vessels, putting a stop to this interesting enterprise, for which Scott Turner, at one time news-editor on the 'Mining and Scientific Press' and now an officer in the U. S. Navy, was resident manager. Just before the War he had taken steps to draw the attention of the European Powers to the desirability of creating some form of international government for the island, because, among other reasons, it was becoming increasingly difficult to deal with recalcitrant labor. Any disputes arising therefrom were tried at Tromsö, the nearest port, in Norway, but this was proving unsatisfactory. In 1912 at an international conference at Christiania it was suggested that a joint control of the island be vested in Sweden, Norway, and Russia; but that came to nothing because England and Germany were not included. Later, it had been arranged by the governments of England, Germany, Russia, and others, to send representatives to a meeting in August 1914 for the purpose of arranging details, but this, of course, was indefinitely postponed by the beginning of hostilities. W. S. Bruce, when reading a paper before the British Association for the Advancement of Science, in 1913, urged his government to annex the island, but the suggestion was ignored, properly. The mention of his name recalls the fact that he was one of the numerous pseudo-heroic Arctic explorers that used to give Mr. Turner so much trouble in rescuing them. Sundry German scientists went through similar motions and would return home with vivid yarns about their 'farthest north', for Spitzbergen extends to Lat. 80° north, bringing it within 650 miles of the North Pole. During summer excursion steamers used to visit Advent bay, where the Arctic Coal

MAP TO SHOW THE POSITION OF SPITZBERGEN

Co. had its headquarters, yet the island has loomed large in the stories of exploration read before various scientific societies, particularly in Germany. Mr. Turner found himself called upon many times to rescue heroic explorers that had lost their way, almost within hearing of the whistle that called the miners to work in the coal mine.

We reproduce an old photograph of Advent bay. It is taken so as to look up Longyear valley and shows the west side of that valley, with the tramway leading to the entry of the Arctic Coal Co.'s No. 1 mine. A glacier appears at the head of the valley. The photograph shows that the coal measures lie nearly horizontal. The upper tunnel of the tramway is about 100 ft. below the outcrop of the principal seam of coal, which is of Tertiary age. The slope shows strata ranging in age from the Carboniferous to the Eocene.

Advent bay is at the extreme south-eastern tip of the Ice fiord, on the west coast of the island of West Spitzbergen. As the map shows, Spitzbergen is an archipelago with a total area of about 33,000 square miles.

The German holdings, to which reference was made in the daily press, are of no consequence. They consisted of a small meteorological station at Ebeltoft Harbor, near King's bay, where a couple of bewhiskered and bespectacled German scientists used to spend the winter, recording temperatures and wind-velocities, and trying to determine by observations how high above the earth the Northern Lights coruscated. This camp consisted of two or three small huts, including a home-made wireless plant, effective for a radius of not more than 50 miles, or less than one-tenth the distance to Norway. It was used to keep in touch with the big station at Green Harbor, where the Norwegian government had erected a wireless plant under agreement with, and contract from, the Arctic Coal Co. which represented the only noteworthy industrial enterprise in Spitzbergen.

FILTER LITIGATION is agitating metallurgical circles in Western Australia. The present suit is between the Moore Filter company and the Great Boulder Proprietary company at Kalgoorlie. The former alleges infringement of its patents; the latter denies this, claiming that the Moore patent is an amalgamation of four inventions, patented in America. The case is likely to be a protracted one. The Great Boulder company, which is the most profitable gold mine in Australia, treats each month 16,000 tons of sulpho-telluride ore yielding $14 per ton, making a profit of $115,000 therefrom. The process is reduction in Krupp ball-mills, roasting in Edwards furnaces, grinding in pans, agitating in mechanically-operated vats, and filtering on Ridgway machines. This filter consists of two rectangular V-bottom tanks, one containing slime, the other cyanide solution. Suspended on balanced arms is a basket of filter-leaves. By an ingenious arrangement this is lowered into the slime. The cake is quickly formed—four minutes or so with roasted ore. Then the basket moves through an arc of 180° when lowered into the solution, where it is washed for 20 minutes. Then the filtered material is lifted to a vertical position and blown-off into a discharge-launder. The Ridgway filter is also used at several other mines, where raw slime is treated successfully.

Manganese in Utah

The U. S. Geological Survey has made public a statement referring to manganese ores in Utah. Manganiferous deposits are rather generally though somewhat sparingly distributed over Utah. Most of the deposits now known are in the Green River and Tintic districts, but reports indicate that many other deposits occur elsewhere, most of them at places rather remote from railroads. The available information suggests that a line drawn diagonally south-westward through the centre of the State would separate areas that contain deposits of two distinctly different types. Practically all the known deposits west of this line are derived from quartz lodes of deep-seated origin. The ore is highly silicious, and most of it needs some degree of concentration or beneficiation to make it marketable. Most of the deposits east of the line are of sedimentary origin, lie flat, very near the surface, or even upon it, and generally need only careful mining to yield a very high grade of ore.

Manganese ores occur in several places in the area that extends from Utah Lake south-westward 75 miles or more and that embraces parts of Utah, Tooele, and Juab counties. Most of the development work has been done in the central part of this area, in the Tintic and West Tintic or Erickson mining districts. The deposits elsewhere are reported to be wholly undeveloped or opened only by shallow workings. Several manganese deposits are partly explored by workings made during the last forty years in search of silver and lead ores. Small amounts of manganese ores and manganiferous iron ores have annually been produced in the Tintic region for use as flux in lead and silver smelters. Among the older mines in which manganese ore has been explored are the Tip Top tunnel, at Homansville, and the Black Jack group, in the West Tintic district. Both are now producing high-grade manganese ore. Other mines in which considerable bodies of manganese ore are found are the Baby Elephant group, Queen Mary, Indian Boy, May Farmer, and Eutonia. Undeveloped outcrops of manganiferous material similar to that of developed orebodies are numerous. Up to the end of June 1918, about 1400 tons of manganese ore had been shipped, the average assay being 38% manganese and 10% silica.

ALUMINUM ALLOYS may be analyzed as follows, according to A. W. Willis: To determine Mn, dissolve 1 gm. in 25 to 30 cc. of HNO_3 (d. 1.2) plus one drop of HF, and proceed by the bismuthate method, the HF having no detrimental effect. In determining Ni by the glyozine method, dissolve the alloy in dilute HCl plus 1 or 2 drops of HNO_3 to dissolve the copper residue. Dilute, add 10 gm. of tartaric acid, and, when dissolved, add a suitable amount of dimethylglyozine solution; make ammoniacal, and let stand; filter through counterpoised papers, and dry and weigh. For copper the KI method is more satisfactory than the KCN process.

SAN FRANCISCO

Exemptions and Furloughs for Mining Men.

The Federal government has made provision for retaining in industrial work such men as are necessary for the various essential industries. Under the most recent ruling of the War Industries Board, Priorities Division, the production of metals and ferro-alloy minerals is made essential under Class 2. The following facts and suggestions are offered for Californian mine operators as to the proper course to pursue to prevent the loss of such of their employees as cannot be replaced.

District draft-boards in the present draft, in considering claims for deferred industrial classification, will have to assist them a board composed of three advisors—one representing agriculture, one industry, and the other professional. The industrial advisor of each district board has been or will be advised by the various authoritative bodies at Washington of the essentiality of the various industries, and the essential occupations connected with such industries.

The industrial advisors for the State of California are:

Name and Address	Dist. Board and Headquarters
E. J. Fowler, San Francisco.....	Northern No. 1, San Francisco
Thomas Pollard, 112 Market St., San Francisco	Northern No. 2, San Rafael
A. Galloway, Sacramento.....	Northern No. 3, Sacramento
Dr. J. R. Haynes, Los Angeles.....	Southern No. 1, Los Angeles
Elias J. Emmens, Bakersfield.....	Southern No. 2, Bakersfield

The first step in order to prevent the loss of an essential employee is to get in touch with one of the above industrial advisors and endeavor to secure exemption on industrial grounds.

In the event of failure to secure exemption on industrial grounds, then and then only should an effort be made to secure a furlough. A furlough cannot be secured for any man who has not already been inducted into the military service, or is either in or on his way to a military camp. Requests for furlough must come from employers.

Van H. Manning, Director of U. S. Bureau of Mines, has been appointed by the Secretary of Interior to certify to the War Department all applications for indefinite furlough for return to metal mining and metallurgical industries of enlisted men in the Army. To facilitate such certification and in order to secure an opinion based upon the particular case involved and the attendant local conditions, the country has been subdivided into districts with a certifying advisor for each district.

Edwin Higgins, 625 Market St., San Francisco, has been appointed District Certifying Advisor for California. Working in co-operation with him, as assistant-advisors, in the districts indicated, are the following: N. S. Kelsey, Jackson, Amador county; P. C. Knapp, Alaska Commercial Bdg., San Francisco; and T. E. Graff, Redding.

Having failed to secure exemption and being desirous of securing a furlough for an essential man, the employer should get in touch with the nearest Assistant-Advisor.

The general classes of men who will be considered for certification for furloughs are:

1. Those engaged in management and superintendency, including dredge-masters.
2. Highly trained technical men.
3. Skilled mechanics, including crane-men and operators of automatic (smelter) machinery, steam-shovel operators, and hoist-men.
4. Drill-runners and timber-men.
5. Head furnace-men, including magnesite-burners, and first helpers.

CRIPPLE CREEK, COLORADO

Several Promising Discoveries.

A surface discovery of importance has been made on the property of the Isabella Mines Co., on Bull hill by Eden Beebe of Cripple Creek and Harry Nelson of Victor, lessees. Prospecting north of the old Maloney shaft on the Orphan Belle, these operators have opened up in virgin ground the extension of the rich Maloney vein and at a depth of about 18 ft. they are mining ore carrying both rusty gold and sylvanite. The ground is virgin to a depth of 500 ft., and from the present showing the lessees will take out a fortune if the ore persists to that depth.

The Ramona, a claim owned by the Ramona Gold Mining Co. on Bull hill, and idle for many years, is the scene of a promising discovery by lessees. At a depth of 80 ft., ore running from $14 to $35 per ton has been opened up and shipments will start during the present week.

The Reva Gold Mining Co., operating the Rose Nicol on Battle mountain, is constructing an aerial tram from the mine to the loading-station on the Midland Terminal railroad in Eclipse gulch, and building a modern six-bin ore-house preparatory to heavy production. The Rose Nicol shaft has been sunk to a depth corresponding with the 100-ft. level of the Portland No. 2 shaft, with which the Rose Nicol workings have been connected and the 1200-ft. level of the Dexter mine on Bull hill. Capital from Jacksonville (Florida) and Johnston (Pennsylvania) controls the Reva Gold Mining Co., operating the mine under a six years lease from the Rose Nicol Gold company.

The Lincoln Mines & Reduction Co. has installed electric lights on its leased property on Ironclad hill and two shifts are now working on a body of manganese ore recently uncovered. Machinery is ordered and construction plant on the concentrator has commenced.

The Strong mine, on Battle mountain, one of the richest of the old producers, with a record in excess of $10,000,000 gross from the 8 acres contained in the Strong mining claim, will close down at the end of the month. The shutdown is attributed to labor shortage.

TORONTO, ONTARIO

Stimulating Prospecting.—Road to Boston Creek.—Dumps at Cobalt.—Mining School at Haileybury.

The Ontario Department of Mines is taking an active interest in the problem of providing suitable employment for returned soldiers. As a large number were engaged in mining and prospecting prior to enlistment, it is believed that more suitable opportunities could be offered them than those presented by the opening of new fields for exploitation. With this object in view, Cyril W. Knight, A. G. Burrows, and other officials of the Bureau of Mines are engaged

in investigating and mapping the geology of the territory lying south and west of Lake Abitibi in northern Ontario. This area includes the Lightning River field and Rickard township, where promising discoveries have been made. It is hoped that the work will be completed in time for the map to be issued for use by prospectors early in the spring. Another discovery has just been made at Lightning River, a 4-ft. vein showing visible gold having been found on the Ferron claims, one mile from the Howie-Cochenour property.

Boston Creek.—Government engineers have started surveys for a new road to be constructed as soon as labor can be obtained. In addition to serving the Boston Creek field, it will open the adjoining township of Skead, passing through country believed to offer great possibilities.

Kirkland Lake.—Plans for extensive development of the Ontario-Kirkland mine have been arranged. The main shaft will be sunk from 100 to 300 ft., at which depth 1500 ft. of lateral work will be done. A number of strong and well-mineralized veins have been uncovered on the surface.

Cobalt.—Upward of 10 cars of ore have been shipped from old dumps of the Foster mine, the average silver content of which is 10 oz. per ton. The dumps contain 13,000 tons, some of which is high-grade. This is being sorted out. Underground work is being done on the upper levels.

Haileybury.—A new mining-school has been opened here with machinery valued at $30,000, much of which was donated by Cobalt mining companies. It is managed by a board representing several companies, and has a teaching staff of six, all of whom have had extensive mining experience. Thirty-five pupils have been enrolled so far.

SUTTER CREEK, CALIFORNIA

Central Eureka and Old Eureka Mines.—Wages Raised.

Recent developments at the Central Eureka mine are most encouraging. A winze started recently on the 3500-ft. level, 100 ft. west of the shaft, has reached a depth of 17 ft. on the new orebody. At the bottom of this winze the vein has a width of 14 ft. It not only shows free gold, but carries considerable high-grade sulphides. Assays show the average value exposed to be over $25 per ton. The fact that the walls are well defined, and the hanging wall becoming harder with depth, speaks well for the persistence of this ore. The foot-wall carries a 3-in. gouge seam, which is a favorable condition not encountered above. Work is to be continued vigorously in this winze as soon as the erection of a small air-hoist is completed. This machine, in place of the 'tugger' hoist so far employed, will not only speed-up work in the winze but permit of other work on the 3500-ft. level, with less interruption. A good grade of ore has also been opened in the north stope on this level. The grade appears to be improving, as it is being opened toward the north boundary or in the direction of the Old Eureka mine. The importance of the development of a new orebody in this direction is shown by the fact that over 3000 ft. of Central Eureka ground above this point has never been prospected, though old records prove that a shaft sunk years ago near the north boundary cut a vein from which good milling ore was extracted and hauled to neighboring plants for treatment. The belief that this is an entirely distinct body from anything worked through the present shaft seems well founded. The ore comes in at an angle of 60° from the line of the stope, and has a dip to the west of 75 to 80°, while the vein on which the stope was started dips 75° to the east. Development at this mine has been seriously retarded by lack of labor and high costs, and as an added burden, the closing down of the adjoining South Eureka mine during the spring made it necessary for the Central Eureka to bear the entire expense of keeping both mines unwatered, as the joint pumping-plant is in the South Eureka shaft. Repairs to the South Eureka shaft, pumps, and electric machinery have been costly, but that portion of the plant is now in such shape that expenses there will from now on be materially reduced. The property gives promise of keeping the mill supplied with ore of good grade for a long period. Other promising prospects in the mine will be developed as soon as opportunity permits. The executive staff of this property consists of Albion S. Howe, superintendent; Henry Warrington, assistant; and W. J. Bryant, mine foreman. The main office of the company is in San Francisco.

The shaft at the Old Eureka mine is 2700 ft. deep 550 ft. below the bottom of the shaft, as it stood when the present company took over the property. In addition to the 550 ft. sunk of the proposed 1000 ft., the new owners enlarged the old shaft from 1600 to 2150 ft., from two to three-compartment size, and repaired the shaft throughout. Although short-handed, there has been no cessation of work. While sinking continued, other men were engaged in cleaning-out old drifts and cross-cuts and extending them. As a result of this work, some good ore has been developed, particularly on the 2100-ft. level. During the first few weeks work, the ore appeared in small lenses, but within the last ten days a well-defined vein has been found, upon which work is progressing. While specimen ore has been taken out of this shoot, it has not yet been sufficiently developed to form any estimates, but this, together with conditions on the 1600 and 1200-ft. levels, give the owners reason to hope for good results in the future. It is not likely that any new levels will be opened below 2100 ft. until after the shaft has reached a depth of 3100 ft. This point will be reached in a comparatively short time, judging by present progress. Shaft work is being done under contract, while other work is being done by day labor. T. Walter Beam is superintendent, and T. J. Donovan is in charge of underground work.

On October 1 a 50-cent raise to miners and timbermen went into effect at all mines in this county, and shovelers, carmen, and top hands had their pay increased at various mines from 25 to 50c. per day. This move is considered a war measure, deemed necessary in order to offset the alarming shortage of labor.

MEDFORD, OREGON

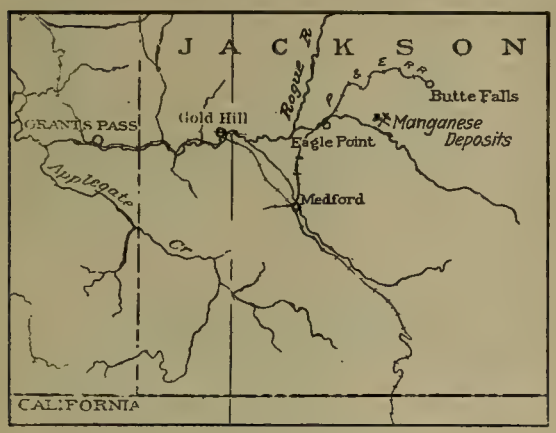
Manganese Deposits, Their Extent and Value.

An examination of a large number of manganiferous deposits in Oregon, including a reconnaissance of 150 square miles near Lake Creek, was made in July 1918, by J. T. Pardee, of the U. S. Geological Survey, in company with Henry M. Parks, director of the Oregon Bureau of Mines and Geology. Mr. Parks placed at the disposal of Mr. Pardee the results of his previous work in this area, and both are responsible for the estimates and conclusions given.

So far as known the manganiferous deposits of the Lake Creek district are confined within an area of 150 sq. miles in the east-central part of Jackson county. The area is rather sparsely settled; farming is the principal industry. The nearest large town is Medford, 15 miles directly southwest of the deposits, but nearly twice that distance by the available roads. Eagle Point, a town on the Pacific & Eastern Railway, is the most convenient shipping-point. The surface of the region is hilly and in places mountainous, but only moderately rugged. The local relief ranges from a few hundred to 2000 ft. or more; the general elevation is between 2000 and 2500 ft. Streams are numerous, though most of the smaller ones become dry in summer. The climate is mild, and the year is made up of a wet and a dry season. Most of the rather heavy winter precipitation falls as rain. The greater part of the surface that lies below 2500 ft. is covered with a mixed growth of madrona, manzanilla, and chapparal bushes, and rather scrubby oaks. At higher elevations, fir and pine trees are abundant. About

1500 tons of ore, containing at least 15% Mn, is available. In addition, incomplete prospecting by drilling and open-cuts indicates that at least 4 acres are probably underlain by 10 ft. of ore (120,000 tons) containing probably 10% Mn. Surface indications in other parts of the district warrant an estimate that they may yield 130,000 tons more of material carrying at least 10% Mn, so that the probable reserves of ore of this grade amount to at least 250,000 tons.

Manganese mining is a new industry in the Lake Creek district, actual development having been started late in 1917. Since October of that year the Manganese Metals Co. has explored by open-cuts and drill-holes, 3 or 4 acres on the Tywell ranch, 5 miles south-east of Lake Creek post-office, and has erected a mill capable of dressing 20 tons of crude ore in 24 hours. This mill has been in operation intermittently since March 15, 1918, and has produced concentrate that averaged 45% Mn. Four tons of crude ore yielded one ton of concentrate. Since this company began work the known limits of the manganiferous area have



MAP OF PART OF OREGON

been considerably extended by prospectors, and a large number of claims have been located.

The cost of hauling concentrate by teams from this mill to rail at Eagle Point is now $4 per ton. At a moderate expense the roads could be made usable for heavy trucks throughout the dry season—from April to November. Water for working many of the deposits can be obtained almost throughout the year without great expense, and timber for mine and mill construction is within easy reach of most of the mines. Wages are $5 or more per day, and mining supplies are as expensive as they are elsewhere in the North-West. Electric power is available from a transmission-line passing through Eagle Point.

Options on several claims, including the larger part of the holdings of the Manganese Metals Co., have recently been obtained by Victor Rakowsky of Joplin, Missouri. He has arranged to begin working the deposit on the Tywell ranch by churn-drilling, and has taken steps to obtain water and machinery sufficient to work on a large scale such orebodies as he may find. He will probably have demonstrated the value of his property and of his other options within a few months. His plans contemplate at least one mill having a daily capacity of 500 tons of crude ore, which is to be in operation before the end of 1918. Unless some unforeseen contingencies arise, the mill of the Manganese Metals Co. will no doubt continue production indefinitely at its present capacity. The results so far obtained by Mr. Rakowsky on a test shipment and by the Manganese Metals Co. show that a high-grade manganese concentrate can be profitably made from the ore at the Tywell mine and presumably from that at the other Lake Creek deposits.

LARAMIE, WYOMING

The Exploitation of Manganese Deposits.

There are few known deposits of manganese ore in the State of Wyoming. A deposit in the northern part of Albany county was examined by E. L. Jones, Jr., of the U. S. Geological Survey, on October 5, 1917. The deposit is being exploited by the Wyoming Manganese Co. of Laramie. At the time the deposit was visited no ore had been shipped, although 200 tons, containing 40% Mn, was on the dumps. Later in 1917, 30 tons of high-grade ore was shipped to a mill at Boulder, Colorado, for experimental purposes. Development consisted of 200 ft. of tunneling connecting with a shaft 25 ft. deep. The mine is on a gently-sloping mesa on the western flank of the Laramie mountains, near the head of Sheep creek, at an elevation of nearly 8000 ft. It is accessible from Medicine Bow, on the Union Pacific railroad, by a fair wagon-road 38 miles long. The manganese is associated with a bed of chert from 1 to 8 ft. thick, intercalated in beds of pink or maroon limestone and thin interbedded sandstone. The minerals are the oxides, manganite and pyrolusite, which have wholly or partly replaced the chert or extend for short distances into the enclosing wall-rocks. Much of the ore consists of fern or tree-like aggregates of pyrolusite in the chert. The silica that was replaced is re-deposited in bluish opaline masses. Cavities in the ore are lined with beautiful sparkling crystals of manganite and here and there with tabular crystals of barite. The ore contains little iron. The workings show that several thousand tons of manganiferous chert is available for mining. Much of this material is too silicious, but considerable ore containing 40% Mn could be hand-sorted and marketed with profit. The company has experimented with several processes to concentrate or dress the ore, but has not yet reported the results of its experiments. The deposit may prove to be a source of ore for use in dry batteries and in chemical work. Much of the ore is pyrolusite, reported to contain less than 1% of iron. The manganese deposit appears to be of sedimentary origin, and the original manganese minerals were probably deposited with the chert. Black chert is scattered over a large area near the mine, and probably other manganese deposits will be found in its vicinity.

MONTEREY, MEXICO

Improvements in Many Districts.

Mining and metallurgical operations continue to show improvement in practically all of the larger districts of Mexico, with the exception of those that are more remotely situated in the states of Durango and Chihuahua. Many of the larger American mining companies are preparing to bring their properties up to the normal state of production that existed prior to the revolution. It is announced that the American Smelting & Refining Co. plans not only to bring its several smelters and mines in Mexico up to their former outputs but that it has appropriated $4,000,000 to be expended in enlarging its operations. The railroad situation is the most serious hindrance to a general resumption of industrial activities. The lack of equipment and the poor physical condition of the various lines comprising the National Railways of Mexico, now officially called the Constitutionalis Railways of Mexico, makes it difficult for many mines and manufacturing plants to carry on their business.

TEXAS

Marfa.—Preparations are being made by the Capote Nitrate Co., recently incorporated with a capital of $100,000 and head office in San Antonio, to develop a nitrate deposit near Marfa. According to the charter of the company its purposes are to "mine and manufacture nitrate of potassium and sodium nitrate." The incorporators are Alfred Dueler, G. C. Simpson, and J. B. Herff, all prominent business men of San Antonio.

ARIZONA

Bisbee.—The high wage-scale of the Warren district—$6.10 per day for miners and $5.85 for shovelers—which has been in effect since August 1, is particularly emphasized by a comparison with the Michigan scale recently announced for October 1, according to the 'El Paso Herald'. In comparison with the $6.10 rate for miners, the highest rate for miners in Michigan is $5.10 per day; while shovelers in Michigan are receiving $4.80, compared with $5.85 received by these workers in the Warren district. There is even a greater difference in the wages of timber-men, these men in Michigan receiving $4.25 per day, against $6.10 in Arizona.

Jerome.—The Grand Island mine has resumed sinking from 300 to 535-ft. depth.

United Verde Extension yielded 4,720,000 lb. of copper in September, a decrease.

The Tillie Starbuck Mining Co. has since its organization built a road to the mine and driven 1000 ft. of cross-cut which it is estimated is now 40 ft. from the orebody. The Verde Squaw shaft has reached a depth of 100 ft. and a No. 5 Cameron pump has been installed. The United Verde Extension will distribute the quarterly dividend of 75 cents per share on November 1.

Kingman.—The cross-cut at the 200-ft. level of the Rico mine has cut nine feet of ore, 30 to 36 inches of which will pay to ship.

Metcalf.—The Shannon Copper Co. produced 722,000 lb. during September.

Miami.—The Inspiration Consolidated has declared a regular quarterly dividend of $2 per share payable on October 28.

Nogales.—The mill at the Worlds Fair mine has been completed and is now in operation.

Phoenix.—Sixty managers of smaller properties in this State held a meeting here on October 19 to aid in the passage of Amendment 100, which will give a new workmen's compensation law. At present, damage claims have no limit, as no definite awards are set for injuries. Protests were made against Federal taxation of new producers, and against the proposal to take equipment from development properties and put it on producing mines.

The assessed valuation of Arizonan producing mines for the fiscal year 1918-'19, as fixed by the State Tax Commission, amounts to $421,963,854, an increase of more than $90,000,000 over that of the preceding year. These figures may be taken as indicating the growth of the mining industry, but this in fact is but partly true, according to the 'El Paso Herald'. In their larger significances they show conclusively a State taxing power, which apparently has become a fixed policy to compel the mining industry to contribute a larger and ever-increasing proportion of the revenues for the support of State and county governments. The figures above cover only the valuation of the producing mines of the State. In 1912-'13 the assessed valuation was $45,145,084; in 1917-'18 it was $393,421,537, an increase of 873%.

Prescott.—The Victor & Bell Crown property, which has been dormant for several years, is being developed by Rochester capitalists. This property is near the Cunningham Pass mine. Four thousand feet of development was done before the property closed down. An adit is now being driven 200 ft. below the old workings.

Ray.—H. E. Easterday has filed a complaint against W. E. Codgell and has asked that a receiver be appointed for the Ray-Kelvin Mining Company.

Salome.—J. B. Marlin, manager for the Yuma Warrior Mining Co., announces that the company has been financed for extensive development work on the old Harqua Hala property, which produced considerable gold in the past. The Victory Queen Mining Co. is developing a gold property in the Little Harqua Hala mountains three miles south-east of the mine of that name. Development at the Little Giant continues, two levels now having been opened. At 115 ft., the present lowest level, 300 ft. of driving has been done. From development work alone ten cars of 12 to 21% copper ore has been shipped. Sinking is to be continued and stoping is under way on all levels. The rich ore is in a vein varying from 5 to 48 inches in width.

Silver Bell.—The El Tiro mine in this district of Pima county is again becoming a large producer. Under the management of Percy Williams, it is shipping 36 cars of 6% red-oxide copper ore per month to the smelters at Sasco and Hayden. It is predicted that shipments will be increased to three or four cars daily early in 1919. The present output is 175,000 lb. per month. From 75 to 100 men are employed. El Tiro is a neighbor of the A. S. & R. Co., which is operating at Silver Bell and owns the Sasco smelter. El Tiro is operated under lease from the receiver, M. P. Freeman of Tucson. The property is well equipped with machinery. Electric power is obtained from Sasco. Mr. Williams opened this mine for the owners and developed the district 20 years ago. He returned to Silver Bell last fall.

Superior.—Magma Copper produced 747,805 lb. in September, considerably below previous returns.

Tucson.—The State Bureau of Mines is to commence a geologic survey of Arizona, to be in charge of O. P. Jenkins.

The Zonia Mining Co., and the holdings of the McMahon Bros., have been acquired by a Tucson syndicate. The Zonia property has been idle for some time but the McMahon has been a regular shipper for several years.

Wenden.—The Little Giant and Critic mines continue to make regular shipments of copper ore. That of the Little Giant carries 20% Cu.

It is expected that work will be started soon at the Wilkinson, American Flag, Vindicator group, also the Jerry group. Gold properties in this district are still inactive.

CALIFORNIA

San Francisco.—Reports filed with the California State Mining Bureau for the week ended September 28, show 11 new wells ready to drill, making a total of 563 wells reported since the first of the year. Although new wells reported are the principal indicator of what may be expected toward maintaining the oil production of the State, a study of the detailed report of proposed deepening and re-drilling

operations, of which there were nine listed during the week, throws some interesting sidelights on what is being done, and what can be done, toward increasing production of petroleum by decreasing the amount of water, that it is necessary to raise to the surface, in some fields. An example of such remedial operations is given this week in the notice of intention of Union Oil Co. to deepen well No. 5, Squires, in the old Santa Maria field. The proposed deepening operations will take this well into the third oil zone of the Santa Maria field, and are in line with similar operations, carried out in a number of wells, during the past three years, whereby not only a clean and profitable production has been obtained, but large quantities of water have been eliminated. The total figures for the quantities of water being produced in various fields of the State, as given in the recently-issued second annual report of the State Oil and Gas Supervisor, R. P. McLaughlin, are worthy of careful consideration by all those who are interested in increasing the production of oil and reducing the cost.

The report showed the following for June 1917:

County	Oil, bbl.	Water, bbl.
Los Angeles and Orange	1,396,020	321,840
Ventura	81,840	31,620
Santa Barbara	477,408	207,135
Coalinga field	1,282,602	313,138
Other fields	3,237,870	873,735

Darwin.—Nine miles from this place in Inyo county, and 34 miles from rail at Keeler, is the Utacala Exploration Co.'s zinc mine, according to G. H. Ryan in the Salt Lake 'Mining Review.' The ore is mostly hydro-zincite, averaging 40% zinc and 12% moisture. Some lead ore is found, but is kept separate from the zinc. The orebody is a replacement of limestone, occurring along the intersections of two fracture-zones. In order to lessen haulage charges, a calcining-plant was erected in May 1918. This briefly consists of a vertical kiln, in which the ore and coal are fed in layers, the fuel being 6% of the weight of ore. Care must be exercised not to get the temperature too high, as zinc would be volatilized. The grade of the ore is raised to 53% zinc. The cost of calcining is from $3.20 to $4.50 per ton; the value of the ore increases from $22.50 to $38.10; and the shrinkage during calcining is 22%. The kiln treats 8 tons per 24 hours.

Downieville.—The Loftus Blue Lead Mines Co. of Los Angeles has applied to the State Water Commission for a permit to use 50 cu. ft. per second of the waters of Little Canyon creek, tributary to Canyon creek, in Sierra county, for hydraulic-mining purposes. Water is to be diverted by means of a wooden dam 10 ft. high, 40 ft. long on top, and 20 ft. long on bottom, already constructed, and will be conveyed to place of use by main ditch 4 miles long. Water will be returned to Slate creek above where Canyon and Slate creeks join, after use. The cost of proposed work is $10,000.

COLORADO

Cripple Creek.—The Gold Dollar company's indebtedness has increased to $16,310, and an assessment of 1c. per share has been levied. Lessees paid fair royalties, but insufficient to pay all expenses. The lessee at the main shaft ceased work a year ago, and nobody has taken it on since.

Jamestown.—The Warren mine is now sending to the Wano mill 25 tons of 50 to 65% fluorspar daily, where the grade is raised to 90% CaF_2. The concentrating-plant eliminates the silica and other impurities.

IDAHO

Hailey.—The Federal M. & S. Co.'s North Star mine is closed pro tem, as there is no demand for its ore. The Independence mine, near by, is producing 100 tons of ore daily.

Kellogg.—The Caledonia company pays 3c. per share, $78,150, on November 5. One more dividend of 3c. will be paid, after which the rate will probably be reduced. The September profit was $35,000.

Mullan.—The Federal M. & S. Co.'s Morning mine is producing 1000 tons of ore daily. In August the rate was only 300 tons; two years ago it was 1600 tons.

The Hickory mine, twin claim to the You Like mine of the Federal company, is to be developed by the Old Hickory Mining Co., just organized by Oscar Nordquist, president and manager; O. A. Olin, vice-president; H. H. Ross, secretary-treasurer; Walter Hanson and H. B. Kingsbury, all of Wallace, Idaho, directors. The Hickory is about the last of the early and rich discoveries in this mineral belt to be developed. It was located in 1891 by W. Clark and J. Helmil on the same day as they located the You Like mine, which has been very profitable to the Federal company. The Hickory has been sought by the Federal and other large operators, but only in the last month was consent to a sale obtainable from all of the owners. Some old surface workings and shafts show rich silver ore.

Porthill.—The Idaho-Continental has shipped 77 cars of ore and mill products valued at $231,000 since July 17. Crude ore carries 58% lead, concentrate about the same, and slime up to 70%. All contain over 22 oz. of silver per ton. Auto-trucks haul the ore to rail, a distance of 26 miles, but sleighs will be used in winter. To increase the power supply, a 14,000-ft. ditch has been dug to divert certain creeks. A 2000-ft. aerial tram is to be erected by the Riblet company to span the Kootenai river, thus dispensing with the present ferry. There are 150 men employed, in charge of A. Klockman.

Wallace.—The Wallace 'Miner' states that three companies, all under management of C. L. Hewitt, are profitably treating old tailing in widely-separated points of the district. The North Idaho Metals Co. is operating on the river about half-way between Wallace and Mullan. In the summer of 1917, 10,000 tons of tailing had been impounded in a settling-pond, assaying 5.5% lead, 5.5% zinc, and 2 oz. silver. After much experimenting a process was evolved to separate the lead and zinc by flotation, producing a concentrate averaging 60% lead and 3% zinc, and another containing 35% lead and 12% zinc. The plant has a capacity of 90 tons per day, from which is produced 4½ tons of lead and 5 tons of zinc concentrate. During 1917 the gross value of shipments was $40,000.

The Mullan Milling Co. has a lease on the old Ontario dump, in Government gulch, below Kellogg. This company recently completed a mill of 150 tons capacity. The process includes fine crushing and flotation. During the few weeks the mill has been running, operations have been largely experimental, but results have been so satisfactory that large profits seem assured. The lead-silver dump under lease is estimated to contain 150,000 tons.

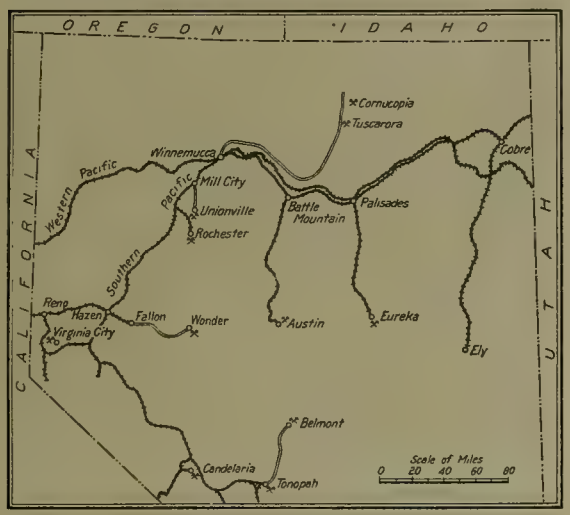
The Spokane Metals Recovery Co. is preparing to rebuild its plant on Nine Mile, recently destroyed by fire. The company had invested $22,500 in this mill. Its equipment consisted of rolls, jigs, tables, and flotation cells. A ball-mill had been ordered, but fortunately had not arrived when the fire occurred. The site of this mill is on the east fork of Nine Mile, just below the large tailing dump from the Rex mill while operated by the Tamarack. The mill was new, having been running only a few weeks and had demonstrated its adaptation to recovering the metals of the tailing. It is believed that most of the machinery can be used again, and the company proposes to re-build the plant at once, adding to it a ball-mill and probably other equipment.

NEVADA

Beatty.—A large plant has been erected, at a reported cost of $100,000, to recover silica from ground owned by the Western Silica Co., 9 miles from Beatty, in southern

Nye county. This company has acquired 22 lode claims. It is said that grinding is the only treatment required to produce a marketable product.

Belmont.—The Nevada-Wonder company has 25 men engaged in unwatering the old Monitor-Belmont mine here, under the direction of E. E. Carpenter, manager for the Nevada-Wonder. The water has been lowered to a depth of 240 ft. Work is in progress at the 200-ft. level through the Belmont and Highbridge shafts. The working-force will be increased as the unwatering drains deeper levels.



MAP OF CENTRAL NEVADA

The old court-house at Belmont has been acquired by the company and restored for use as a club and living quarters for employees.

Ely.—A 15-ton mill is being erected on the Shepherd tungsten mine in the Regan district, north-east corner of White Pine county. O. E. Roodhouse, formerly manager of the O. S. Tungsten mine, south of Osceola, is in charge.

The Holmquist manganese mine, 9 miles south-east of Ely, continues to ship a good deal of high-grade ore.

At an elevation of 6500 ft. on the eastern slope of the Shell Creek range, 30 miles north-east of Ely and 22 miles from McGill, is the property of the Muncy Creek Mining Co. Auto-stages run three times a week from Cherry Creek, a station on the Nevada Northern line, to Aurum. C. D. Ray and others of Utah formed the present company, and have worked the mine for a year, shipping enough ore to pay for the property. The last carload assayed from 15 to 24% copper and 20 oz. silver per ton. M. E. Basset of Fruitvale, California, sold his long-held interest to these people. The mine is well equipped, and is said to show good prospects of developing into a large producer.

Goldfield.—A large pump is now at work at 800 ft. depth in the Grandma, and development at depth can continue.

Lessees working in a winze sunk below the 65-ft. level of the C. O. D. mine have ready a lot of $30 gold ore; and recently shipped a car of $18 copper-gold ore from the 200-ft. level.

Thompson.—Mason Valley produced 1,471,442 lb. of copper in September. This is the largest output since May.

NEW MEXICO

Lordsburg.—The Bonney Mining Co. is again operating its mine, as the lease held by the Lawrence Mining Co. expired on September 15. The lessees opened rich ore on the 500-ft. level, and since May sent 66 carloads to the Copper Queen smelter at Douglas. All 2½% ore was left on the dump. Twenty men are working in charge of J. P. Porteus and K. K. Trendt.

Mogollon.—The Socorro Mining Co.'s mill is treating 200 tons of ore daily. The September output was 25,000 oz. of silver and gold.

The Oaks company has ordered a 1200-ft. surface tramway to be built from its new central shaft to the tram of the Socorro M. & M. Co. Counter-balanced skips will be used. The capacity per 8 hours is 75 tons. Ores mined by this company from Maud S, Deep Down, Eberle, and Clifton mines will be carried by this tramway. In the meantime burros will continue to be used for moving ore.

OKLAHOMA

Douthat.—The Quebec mine here is turning out the best concentrate known in this district. Five carloads recently assayed 64.8, 64.9, 64.9, 65.0, and 65.7% zinc. The product contains no lime or iron, and only a trace of lead. The ore, mined at a depth of 155 ft., yields from 11 to 22% blende. E. R. McClelland is owner, and T. Skelton is manager.

UTAH

Marysvale.—The Liberty Manganese Co. has received settlement for 35 tons of 45.99% manganese ore recently sold.

Park City.—The Judge M. & S. Co.'s enlarged plant will be ready early in December. Its capacity will then be 30 tons of electrolytic spelter daily. The present product assays 99.924% zinc, 0.049% lead, 0.024% cadmium, and 0.003% iron.

Tintic.—Manganese ores occur in several places in the area that extends from Utah lake south-westward 75 miles or more and that embraces parts of Utah, Tooele, and Juab counties. Most of the work has been done in the central part of this area, in the Tintic and West Tintic or Erickson mining districts. The deposits elsewhere are reported to be wholly undeveloped or opened only by shallow workings. A reconnaissance of the Tintic and West Tintic (Erickson) districts, including the examination of four or five partly-developed mines, was made by J. T. Pardee, of the U. S. Geological Survey, in June 1918.

Several manganese deposits are partly explored by workings made during the last 40 years in search of silver and lead ores. Small quantities of manganese ores and manganiferous-iron ores have annually been produced in the Tintic region for use as flux at lead and silver smelters. Among the older mines in which manganese ore has been explored are the Tip Top tunnel, at Homansville, and the Black Jack group, in the West Tintic district. Both are now producing high-grade manganese ore. Other mines in which considerable bodies of manganese ore are found are the Baby Elephant group, Queen Mary, Indian Boy, May Farmer, and Eutonia. Undeveloped outcrops of manganiferous material similar to that composing outcrops of developed orebodies are numerous. The exploration of the lodes for manganese ores began only last October at the Tip Top tunnel, and even more recently in the other parts of the general area here considered. Up to the end of June 1918, 1400 tons of manganese ore had been shipped. Most of this contained from 37 to 40% Mn and from 8 to 12% silica. The ore contains only 1 to 3% of iron, but that from the Tip Top tunnel is rather high in phosphorus, some shipments having contained nearly one-half of 1%. The latest shipments from this deposit, however, show only one-fourth of 1% of phosphorus, and those from the West Tintic district show less than 1/20 of 1%.

Two mines, the Tip Top tunnel and a mine working on the Black Jack group, are now producing altogether about 450 tons per month. Production in the West Tintic district could be increased to 500 tons monthly, and probably to

several times that quantity if reasonably cheap transportation to the railroad could be had. Ore is now being hauled 28 miles by team from the Black Jack mine to Luceme, on a branch of the Salt Lake Route, at a cost of $8.75 per short ton. Ore from other deposits near by would have to be hauled 1 to 5 miles farther, and few of them are reached by good roads. It is said that the railroad company and others are considering a plan to build a branch line from the Salt Lake Route north-westward through the West Tintic district.

Ores of different grades are more or less intimately mixed in most of the deposits, and it is uncertain whether the grades can be readily separated either by selective mining or by some easy method of concentration. Estimates based in part upon examinations made by Mr. Pardee and in part on reports that are believed to be trustworthy, indicate that there is available more than 500 tons of ore carrying more than 40% Mn, and between 8 and 12% silica; and probably more than 3000 tons of ore of this grade. The reserve of ore carrying 25 to 40% Mn and high silica probably will exceed 10,000 tons.

Practically all the mining has been done by lessees who pay the owners royalties of 10% on the net returns at one mine and $2.50 per ton at another. Wages are $4.75 to $5 per day, and labor for the smaller mines has not been difficult to obtain.

The orebodies in general form irregular branching 'pods', lenses, or pipes, which lie along the upper parts of jaspery-quartz lodes in limestone, quartzite, or shale. Most of them extend nearly to the surface and the lower limit of two or three of them is about 100 ft. The largest bodies yet developed are at least 100 ft. long and 15 to 20 ft. diameter in their widest parts. The orebody at the Tip Top has yielded about 27,000 cu. ft. of manganiferous material, and is not yet exhausted. About two-thirds of this material, equivalent to 1200 tons, was selected in mining as high-grade ore. At two mines, the Baby Elephant No. 1 and the Eutonia, the water-level, which is 100 ft. below the surface, marks a rather abrupt change from manganese oxides above to rhodonite below. The workings at the other mines have not penetrated below the oxidized zone.

The ore is a mixture of manganese oxides, chiefly pyrolusite and wad. Although most of it is soft and crumbly, it includes considerable quantities of rather tough and compact wad. Ores of different grades are intermixed in most of the deposits, and it is a question whether the grades can be readily separated by selective mining or easy methods of concentration. Jaspery-quartz is more or less intimately mixed with the ore, and streaks of a soft gray or yellow clay, apparently a decomposition product of the wall-rock, are common. The lodes in which the manganiferous bodies occur are persistent and are apparently of deep-seated origin, and all of these contain more or less silver and lead.

Wendover.—The Silver Queen Leasing Co., operating 30 miles from this place on the Western Pacific, has sent a carload of fluorspar to the Pacific Coast. This is said to be the first fluorspar sent out of Utah. The 20 tons sold realized $31.17 per ton. Eureka and Provo people are largely interested, A. R. Sorensen of the former place being one of them.

KOREA

Unsan.—Oriental Consolidated produced gold worth $95,500 during September. In August, the plants treated 21,842 tons, which yielded $93,470. The rainfall in August was 22¼ in., and the Shorrie reservoir was filled. Okura & Co., who supplied some power to Oriental Consolidated, stopped their plant and went out of business on October 31. The mining company must therefore use wood for steaming until its hydro-electric power-plant is finished.

PERU

La Fundicion.—Cerro de Pasco produced 6,150,000 lb. of copper in September, equal to June last.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

Courtenay De Kalb is at Washington.

Carl Andersen has gone to Goodsprings, Nevada.

William Frazer has returned from California to Butte.

Franklin W. Smith has returned to Bisbee from Parral, Mexico.

J. B. Tyrrell has been examining chrome mines at Black Lake, Quebec.

F. W. Bradley is expected in San Francisco on his return from Juneau, Alaska.

Frederick G. Lasier, of Detroit, now Captain in the Engineer Corps, is at Camp Humphreys.

Ernest B. Lighthill (formerly Lichtenberg) has been commissioned a Major in the British Army.

R. R. Leslie is general superintendent for the Cubo Mining & Milling Co. at Guanajuato, Mexico.

W. Spencer Hutchinson has returned to Boston after examining mines at Cripple Creek, Colorado.

Stanley C. Sears, of Salt Lake City, Captain in the Engineer Corps, is at Camp Humphreys, Virginia.

Arthur J. Bensusan, superintendent of the Ouro Preto mines, in Brazil, is here on his way to Arizona.

J. F. Thorn and **David Pullinger**, of the Butters Salvador Mines, have arrived in San Francisco from Salvador.

D. H. Harroun, manager for the Aguascalientes Metal Co., at Acientos, Mexico, has arrived in San Francisco.

T. E. Mitchell, who has resigned the position of manager of the Burma Mines Ltd., is in San Francisco on his way to London.

James M. Mercer, recently engaged in the management of American wolfram properties in Bolivia, has been transferred to Chile.

Frank H. Sistermand, of New York, will leave for Costa Rica to take charge of the operations of the Nicoya Mining Co., at San Jose.

Robert E. Cranston, of San Francisco, has joined the Food Administration and will not be open for engagements during the period of the War.

E. V. Daveler has resigned as assistant manager for the Alaska Gastineau Mining Co. to become mill superintendent for the Butte & Superior Mining Co. at Butte, Montana.

Anthony Jenkin has resigned as mining engineer to the Seneca Mining Co., Calumet, Michigan, and has joined the staff of the Utah Consolidated Mining Co., Bingham, Utah.

Harry H. Stout, to whom is credited recent important improvements in the smelter practice of the Copper Queen Consolidated, is now Lieutenant-Colonel in the Ordnance Department of the U. S. Army.

Henry Krumb, consulting engineer of Salt Lake City, has been in Washington for several months, having been appointed a member of the Priorities Committee of the War Industries Board. Mr. Krumb will handle all applications for priority certificates relating to the equipment and supplies for copper and other non-ferrous mines and smelters.

W. A. B. Walling died from pneumonia, after influenza, on October 20 in New York at the early age of 29. An Englishman, he received his technical training at the Battersea Polytechnic, London, and had been a member of the Minerals Separation Co.'s staff for 10 years. Although young, he was widely known and respected, both in this country and in England, for his technical ability and personal qualities, and his untimely death, which cuts short a promising career, will be regretted by many friends and acquaintances.

THE METAL MARKET

METAL PRICES

San Francisco, October 29

Aluminum-dust, large and small lots, cents per lb	65—70
Antimony (wholesale), cents per pound	15
Copper, electrolytic, cents per pound, in carload lots	26.00
Copper, electrolytic, cents per pound, in small quantities	27.35
Lead, pig, cents per pound	8.30—8.80
Platinum, Government price, per ounce	$105
Quicksilver, per flask of 75 lb	$120
Spelter, cents per pound	11.50
Zinc-dust, cents per pound	15

ORE PRICES

October 29

Chrome, no definite quotations available.	
Fluorspar, 85% CaF_2, f.o.b. shipping point, or San Francisco, per ton	$22—$30
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 45%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 90% Mo_2S	$1.25
Pyrite, per unit of sulphur, cents	28—32
Tungsten, 60% WO_3, per unit	$20—$26

EASTERN METAL MARKET

(By wire from New York)

October 29.—Copper prices will remain unchanged until January 1. Lead is stationary. Spelter is quiet and easier.

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the maximum fixed price of $1.01½, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce. The British government has fixed its maximum at 48.81 pence for metal 925 fine.

Date	New York,	London,	Average week ending

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.35c., respectively, until August 15. On August 7 the current rates were again fixed until November 1, prices to be effective on the day of shipment, not the day of sale.

Quotations in cents per pound are as under:

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. This is to be continued until January 1, 1919, the price at point of delivery to be at East St. Louis plus freight. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefor $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds.

ALUMINUM

For 50-ton lots of No. 1 virgin metal, 98 to 99% pure, or of scrap, the fixed Government maximum price is 33c. per lb., with 33.10c. per lb. the level for 15 to 50-ton lots and 33.20c. per lb. for 1 to 15-ton lots.

ANTIMONY

The market is stagnant and is again lower at about 13.37½c., New York, duty paid, for wholesale lots for prompt and early delivery.

ORES

Antimony: There have been no developments.

Ferro-silicon: At a meeting of the domestic makers of 50% alloy, except the largest, last week, it is said that the following quotations were agreed upon: $152.50 per ton for delivery in all of 1919, $155 for delivery in the first half, and $157.50 for delivery in the first quarter. The alloy can be bought, however, for $150 for any delivery in 1919.

Manganese alloys: The market is easier, if anything, for both ferro-manganese and spiegeleisen. It is said that the present quotation of $250, delivered, for 70% alloy, plus or minus $3.50 per unit, could be decidedly shaded on an attractive offer. Spiegeleisen, 16% has sold at $70, furnace, against $75 ruling some time ago.

Molybdenite: Inquiries are reported, but no business, with quotations unchanged at $1 to $1.25 per lb. of MoS_2 in 90% concentrate.

Tungsten: The effect of peace on prices and the future of the market is being discussed anxiously. Thus far the market has remained fairly firm with high-grade ore sold at $26 per unit in 60% concentrate. High-grade ores range from $24 to $26 per unit with low-grade ores running from $19 to $24.

Eastern Metal Market

New York, October 24.

All the markets continue quiet with peace talk having very little visible effect.

The copper price to rule after November 1 will be decided Friday of this week, October 25. No change is expected.

The tin market is stagnant with Government control virtually in force, but no price fixed yet.

The lead situation is unchanged, but is satisfactorily controlled.

Zinc has continued stronger, but business has been light.

Antimony is lifeless and a little lower.

The influenza epidemic is quite extensively interfering with the output of iron and steel plants, particularly in eastern Pennsylvania and in the Pittsburgh district. In the case of the Carnegie Steel Co. 10% of the labor force is affected against 7% a week ago. The United States Steel Corporation has resorted to a wholesale serum inoculation. Peace talk has caused a widespread canvass of factors in the coming readjustment, but it has not abated in the least the pressure for the fullest production. Some form of Government control is recognized as necessary in the transition. A feature of the past two weeks has been the inquiry for special steels. At Pittsburgh 1500 tons of vanadium spring-steel and 2000 tons of chrome-silicon-manganese steel for tractors and tanks for France are soon to be closed. About 137,000 tons of barbed wire has been distributed to the Allies, 65,000 tons to Italy, 50,000 tons to France, and 22,000 tons to Great Britain.

COPPER

The price that is to control the copper market for a period after November 1 will be decided on October 25. Very few expect any change in the present 26c. level. As to what will be the market-level after the lid is lifted and all restrictions removed, there is a wide diversity of opinion. One large copper-dealer expressed the opinion today to your correspondent that he did not look for an advance over the 26c. level when more normal times come; he called to mind the fact that before the War the price was about 12c. per lb. and that even under present abnormal conditions there are several companies producing at a cost of only about 20c. Such companies in a free market, he thought, would surely see to it that all high-cost producers are shut out; he did not look for a higher price than 20c. under more normal conditions, especially in view of the greatly increased output of the war period. Influenza and the effects of the munitions explosions near the large refineries in New Jersey are said to have cut down the output of refined copper so that the October production will be less than in September. Some of the employees have not returned to the refineries since the scare as a result of the explosions. An interesting fact is gleaned from the export and import statistics for August, recently made public: the importations that month were 32,000 gross tons, the largest for the year, while the exports were only 18,889 tons, or the lowest for the year thus far. These facts are cited as an argument for larger supplies.

TIN

The fact that market news comes to your correspondent only through actual contact with importers or dealers and not through the public press has, in the case of the tin market, worked to some disadvantage. It has been published from Washington that various new regulations were to go into effect, or already have, but none of this has come directly from an importer. It seems that these men have been practically ignored and that they have been virtually put out of business for the period of the War. They do not know this officially yet at least, but they now acknowledge it as a probability. It is apparent that only the U. S. Steel Products Co. is to be granted any import licenses and that this agent will turn over all metal to the American Iron and Steel Institute for distribution to consumers who are entitled to it. Full details are expected soon, as Mr. Hughes will probably reach this country most any day. A meeting of importers was held in New York last week and another yesterday. It is not unlikely that a Tin Importers Association will be formed to look after the interests of the trade, particularly under present price conditions.

In general the market is lifeless. There have been a few offerings of metal in transit and for spot delivery by those desiring to get rid of the stock before a price is fixed, but demand is very light. Some sales have been made at about 77 to 78c. per lb., New York, for such delivery; but this is a nominal quotation. For the first time certain applications for licenses for shipment of tin in November have been refused; this means that importers from the other side cannot ship metal, but it is felt that some arrangement will be reached whereby importers here will be able to fill any contracts they may have. Evidently Government control of some kind is near at hand, but no price has yet been fixed. Pacific Coast arrivals for the month to October 17 have been 2325 tons, with 425 tons received at Atlantic ports. The London market is again lower with spot Straits quoted yesterday at £334 per ton, or £2 10s. lower than a week ago.

LEAD

The situation is so absolutely in the hands of the Lead Producers' Committee that there is very little to be said. Entire satisfaction prevails and conditions are easier, if anything, due to the good judgment exercised. No domestic lead is being exported, it is stated, and only those doing essential work are apportioned any metal. Prices remain fixed by agreement at 7.75c., St. Louis, or 8.05c., New York. The effect of the conservation of supply is reported as quite evident.

ZINC

The advance that was reported as in progress a week ago has continued until now, so that the quotation yesterday was about 8.85c., St. Louis, or 9.20c., New York, for prime Western for early delivery. Owing to the very light demand this is largely nominal, though 8.90c., St. Louis, is said to have been done in a small way. It is believed by some that the peak of this movement has been reached. Peace talk has scared some sellers, reminding them of the low prices before the War, but it is felt by others that it will be a long time before anywhere near such prices will be experienced again, even after peace comes. The Government inquiries for 9000 tons, noted a week ago, are the principal cause of the firmer market, but it is not known how much of this tonnage has been actually taken, though some of it has been contracted for at around 8.50c., St. Louis, it is believed. November shipments of prime Western have been offered at about 8.60c., St. Louis, with December quoted at 8.50c. There have been bids for first quarter of 1919 at 8c., St. Louis, with a few offers at 8.12½c. The weekly Government report shows a slight increase in output of all grades for the week ended October 12, with a decrease in stocks of over 3000 tons, rendering the statistical position strong.

Mining Decisions

Mining Partners—Fraud in Re-locating

When plaintiff and defendant were equal partners in a mining claim, and defendant promised to have the assessment work done, but did not, and with intent to defraud plaintiff procured another person to re-locate the claim and subsequently sell it, plaintiff was entitled to half the proceeds of the sale.

Kittilsby v. Vevelstad (Washington), 173 Pacific, 744. July 10, 1918.

Mining Deed—Description Construed

A mining company made a mortgage deed specifically describing 2100 feet of its lode and "also all the real estate of said corporation acquired and which may be acquired in Summit county, Colorado, whether the same is particularly described herein or otherwise." Held, that this deed conveyed title to the entire lode and was not limited to 2100 feet thereon.

Sutton, Steele, etc. Mining Co. v. McCullough (California), 174 Pacific, 302. July 1, 1918.

Oil Lands—Cancellation of Patent Refused

In a suit to cancel a patent to public lands issued to the Southern Pacific Company on an affidavit of its land agent that the lands were not of a mineral character, where no mineral development or geological studies warranted an inference at the time the affidavit was made that the lands were in fact valuable for oil, the patent cannot subsequently be set aside because the lands were afterward discovered to be in an oil-belt.

Southern Pacific Co. v. United States (California), 249 Federal, 785. May 6, 1918.

Oil Placers—Group Discovery Work

Drilling on one oil-placer location by a locator to whom various adjoining claims have been assigned by their locators subsequent to the filing of location notices, cannot be accepted as work leading to a discovery on all the locations, so as to bring them all within the provisions of the Picket Act protecting bona-fide locators; it being obvious that whether or not any discovery work would be subsequently carried on such adjoining locations would depend on the result obtained from the drilling done by a party not a locator of these claims on a claim which was not one of an original group.

United States v. Honolulu Consolidated Oil Co. (California), 249 Federal, 167.

Adverse Possession—Presumptions Arising From

In suits to quiet title based on adverse claims to patent, instructions to the jury on the question of presumptions arising from adverse possession for the prescriptive period of time, were improperly refused by the court where the testimony clearly showed that open and exclusive possession had been in defendant or his predecessors in interest for several years, that the annual assessment work had been done, and much additional expenditure for works and buildings made. The jury were entitled to consider this evidence in connection with that of the original discovery made by locators long since dead in order to give the party in possession who was spending time, money, and labor in development, the benefit of all presumptions in favor of an original discovery of mineral in paying quantities.

Ralph v. Cole (Nevada), 249 Federal, 81. May 13, 1918.

Mineral Character—Land Department Finding Conclusive

The United States government may, by a direct suit against a mining locator, test the sufficiency of his discovery to support his location of public lands under the mineral laws; and in such a proceeding, the determination by the Secretary of the Interior that the land is in fact non-mineral is conclusive evidence of its non-mineral character, and hence conclusively establishes that no discovery was in fact made. Evidence to the contrary will not be admitted by the court. The Land Department has the power to set aside a mining location and restore the ground to the public domain where the location is not perfected.

Cameron v. United States (Arizona), 250 Federal, 943. May 6, 1918.

Note: The above case disposes of the contentions of one of the persons seeking to control access to the rim of the Grand Canyon of the Colorado through the medium of a mining location.

Company Reports

NORTH BROKEN HILL, LIMITED

Property: mine and works at Broken Hill, New South Wales, Australia.

Operating Official: George Weir, general manager.

Financial Statement: during the half-year ended June 30, 1918, products realized £329,344 ($1,580,000). Operating costs were 24s.8d. ($5.92) per ton. The profit was £167,415 ($801,600). After paying dividends the balance forward was £60,236 ($288,000). Assets were £599,851 ($2,875,000) in excess of liabilities, mostly cash items.

Dividends: two, No. 47 and 48, of £60,000 ($288,000) each were paid.

Development: the main shaft is 1770 ft. deep. Four levels—950, 1100, 1250, and 1400 ft.—yielded 106,489 tons of ore.

Production: the mill dressed 109,200 tons, assaying 15.3% lead, 7.5 oz. silver, and 12.4% zinc. This yielded 20,605 tons of concentrate, containing 65.2%, 24.1 oz., and 7.7%, respectively. Recoveries were 80.3% lead and 61% silver. The zincy tailing was delivered to the Amalgamated Zinc (De Bavay's) for treatment by flotation, which would add to the above recoveries. The metal contents of the ore were 16,713 tons of lead, 14,583 tons of zinc, and 813,467 oz. of silver.

GREAT BOULDER PROPRIETARY GOLD MINES, LTD.

Property: mines and mill at Kalgoorlie, Western Australia, having produced £11,171,490 ($52,900,000) since 1895.

Operating Official: Richard Hamilton, general manager.

Financial Statement: revenue from gold in 1917 was £529,718 ($2,544,000), of which £253,026 ($1,200,000) was profit. After paying dividends, etc., the balance to 1918 was $2839 ($13,500). Cash, bullion, and supplies, etc., total £233,000 ($1,118,000).

Dividends: four of 9d. (18 cents) each totaled £262,500 ($1,258,000). A similar sum has been paid for 13 years, and the total since 1895 is 3082% on the capital.

Development: only 553 ft. of new openings were made last year, making 22 miles in all; also 1167 ft. of diamond-drilling, making 10.62 miles. Reserves to 2500 ft. in the main shaft are 333,721 long tons averaging $14.98 per ton, to 500 ft. in Lane shaft 15,156 tons of $10.45 ore, and to 1650 ft. in Hamilton shaft 38,634 tons of $11.30 ore, making a total of 387,511 tons, averaging $14.44 per ton.

Production: the ball-mills, roasting-furnaces, grinding-pans, and cyanide plant treated 182,265 tons, yielding 150,030 oz. of gold-silver bullion. Extraction was 90.22%.

Costs: these were $6.16 per short ton in 1917, $5.96 in 1916, $5.70 in 1915, and $5.66 in 1914.

The Key to "One Easy Step" Efficiency

The patented grates and lifter liners account for the remarkable capacity of the Marcy Ball Mill. In the Marcy Mill the crushed product passes through the grates and is lifted by the efficient elevating compartments from the periphery to the hollow trunnion where it is discharged from the mill. The low pulp line obtained through this feature provides rapid grinding at low cost.

Because there is no overgrinding the Marcy Mill makes very little slimes.

Ask for Bulletin No. 42—"One Easy Step."

DENVER SALT LAKE CITY EL PASO

NEW YORK OFFICE, 42 BROADWAY

Wilfley Tables, Marcy Mills, Assay and Laboratory Equipment and Supplies, Electrical Apparatus, General Mining Machinery, Mill Equipment.

MARCY MILL

How to judge a ball-mill--

First learn the price of the mill, the price of the lining, the weight of the mill and the weight of the lining.

Next how long the lining will last, and—most important—how many pounds of balls are consumed per ton of ore ground.

Then with all the weights, calculate the freight charges added to the first cost and compute the cost per ton output.

Comparison will show that, for equal tonnage

The Hardinge Conical Mill

will cost you less installed in your plant and the cost per ton for milling will be appreciably under that for any other means for reduction.

The Proof Is Shown by Repeat Orders

SMELTING CYANIDE SILVER-PRECIPITATE IN OIL-BURNING REVERBERATORY FURNACES
By K. A. Cunningham and Arthur Feust 621
A method devised to overcome the difficulty caused by shortage of graphite crucibles in Mexico. Alternate methods considered, including sale to smelters and melting in brick-lined oil-fired tilting-furnace. Development of current practice. M. & S. P., November 9, 1918.

TUNGSTEN IN CHINA 624
Mining of wolframite in Kwantung, Kwangsi, and Hunan provinces. Large shipments of ore to treaty ports. M. & S. P., November 9, 1918.

ASBESTOS, CHROMITE, GRAPHITE, MAGNESITE, MICA, AND MOLYBDENUM IN QUEBEC 625
A review of the subject abstracted from a report by T. C. Dennis, the Provincial Superintendent of Mines. Distribution of these war-minerals, production, and future prospects. M. & S. P., November 9, 1918.

CHROME AND MANGANESE IN CUBA 628
An abstract from a U. S. Geological Survey bulletin, reviewing the mining operations stimulated by war demands. M. & S. P., November 9, 1918.

A LETTER FROM THE FRONT 629
An introspective letter from a young mining engineer at the Front. M. & S. P., November 9, 1918.

THE FERRO-ALLOYS
By J. W. Richards 631
Abstract of paper read by a recognized authority before the National Exposition of Chemical Industries. M. & S. P., November 9, 1918.

THE METAL MARKET 639
EASTERN METAL MARKET 640
INDUSTRIAL PROGRESS 641

Established May 24, 1860, as The Scientific Press; name changed October 20 of the same year to Mining and Scientific Press.
Entered at the San Francisco post-office as second-class matter. Cable address: Pertusola

Branch Offices—Chicago, 600 Fisher Bdg.; New York, 3514 Woolworth Bdg.; London, 724 Salisbury House, E.C.
Price, 15 cents per copy. Annual subscription, payable in advance: United States and Mexico, $4; Canada, $5; other countries in postal union, 25s. or $6.

3 K. W. 125 VOLT
BALANCER TYPE
ARC WELDING
SET

BULLETIN No. 48940
DESCRIBES THIS
SET
SEND FOR IT

Oscillograph curve, showing electrical conditions in welding circuit of constant energy arc welding equipment.
Curve "A" shows current in arc, approximate average value 150 amps.
Curve "B" shows voltage across arc, approximate average value 15 volts.

Steady flow of metal assured by efficient and simple G-E Welders

G-E constant energy arc welding sets are used to secure a steady flow of metal into the weld and high operating efficiency.

A constant flow of metal is assured by the inherent automatic regulation of the energy in the welding circuit throughout the welding range for metal electrodes.

The distribution of welding current between the two units comprising the set and practically dispensing with external resistance in series with arc, assures high efficiency.

One small panel and the set illustrated are all the equipment needed for a one-man outfit where operator has mask and electrode with flexible cable—if 125 volt direct current is available.

Consistently perfect welds are being produced in essential war industries by the use of this equipment.

We are prepared to demonstrate these sets and make good deliveries

THE Kaiser in his letter of October 28 to the Chancellor makes mention of his "exalted allies." The letter was published a week later, on the very day Austria capitulated and four days after Turkey had surrendered. Fate deletes "exalted" and substitutes 'abased'.

OVER-SUBSCRIPTION of the Fourth Liberty Loan by $866,416,300 more than the six billions required bears splendid testimony to the willingness of the American people to back the Government in the great work now coming to fruition. Before the War the raising of the surplusage would have been considered an achievement.

IT gives us keen pleasure to state that Mr. Horace V. Winchell has been nominated President of the American Institute of Mining Engineers for the coming year. By reason of his personality and experience he will prove admirably adapted to the duties of the office; in consequence of the public spirit he has shown and the professional distinction he has achieved, he is well worthy of the honor.

ON another page we publish a useful article on the smelting of silver precipitate from a cyanide plant in an oil-burning reverberatory furnace at Guanajuato, Mexico. The article is written by Mr. K. A. Cunningham, now general manager for the Mexican companies controlled by the Guanajuato Development Company, and Mr. Arthur Feust, until recently resident consulting engineer in Mexico for the same company.

DEALINGS in mining shares in London have been upset by the epidemic of Spanish influenza, according to the 'Financial Times.' From Ashanti to Johannesburg the working forces in the mines have been hit hard by this infliction. At the Prestea mine three-fifths of the natives are reported on the sick-list, while on the Rand the Kaffirs have gone down like ninepins to the pestilent germ. Incidentally, we may mention that a week ago more than half our own office-force was laid up, but, fortunately in no case did a fatal result ensue.

SECRETARY McADOO, it is announced, has nominated a committee to investigate the difficulties hindering the production of gold and to devise some plan of affording relief. This committee consists of Messrs. Raymond T. Baker, the Director of the Mint, Edwin F. Gay, representing the War Trade Board, Emmet D. Boyle, Governor of Nevada, Pope Yeatman, representing the War Industries Board, and Albert Strauss. It is five months since Mr. McAdoo stated that the production of gold ranked in importance next to that of food and ammunition, therefore it should not seem discourteous to suggest that this appointment of a committee is a belated recognition of an important industrial problem and that the least the committee can do is to expedite its investigations so that any proposal resulting therefrom may be put into effect without delay.

IN the 'Mining Magazine' for September there appears an excellent article by Mr. E. Mackay Heriot, on 'Mining in Spain,' in the course of which he refers to the platinum deposits of that country. It appears that a Spanish geologist, Don Domingo Orueta, has detected platinum in the dunite rocks of the Ronda mountains. This fact is interesting to miners in California because similar basic rocks are to be found in this State, although they are difficult to recognize on account of being readily altered to serpentine. In the Ural region, which is the chief source of the world's supply of platinum, this metal is derived from peridotite, of which dunite is the basic and norite the acid phase. Although platinum is mined wholly from the debris of such rocks, in the form of alluvium, it is important to trace its source in order to ascertain the localities likely to furnish profitable placer deposits.

'IMPERIAL' has become a word taboo in the lexicon of modern democracy. The governments of Germany and Austria-Hungary have been wise to the logic of events and no longer use this adjective. There is a decided slump in kings and emperors; they are going into a discard prepared for them by centuries of misrule and suffering. Even our friends the British are beginning to speak of the Commonwealth in preference to the Empire, and the day is at hand when realities will be recognized and their king will be called, as he is in fact already, a hereditary president—a term, by the way, misused ludicrously by William II of the Hohenzollern dynasty when he suggests that he might be thus designated by the people whom he has led to disaster. In time the hereditary idea in government, as in legislation, will

be recognized to be a belated anachronism, together with primogeniture and other fallacies inherited from the dead formulas of feudalism.

SATISFACTORY as it may be that the German grip on the New York metal market has been broken by that excellent official, the Alien Property Custodian, Mr. A. Mitchell Palmer, it will not be an unalloyed benefit to the mining industry if the control of our principal metal market slips into the hands of any other cartel of speculators. Henry R. Merton & Co., the British representative of the Frankfort Metallgesellschaft, has been liquidated and the American Metal Company of New York will shortly be dissolved. So far, so good; but, owing to Government control of the business, all American copper is now being exported through the American Smelting & Refining Company, the domestic field being left to the United Metals Selling Company. We hope the time may come when it will be considered improper for smelting companies to act as metal-brokers and that an even more auspicious day may supervene when the market for copper and lead, for example, will not be in the hands of any smelting company or any group of buyers.

WE have received a copy of the brief filed by Minerals Separation in support of its petition to the U. S. Supreme Court for a writ of certiorari, and of the opposing brief filed by the Butte & Superior Mining Company. The petitioners assert that the two questions involved are (1) whether the Court by its decision in the Hyde case confined the patent in suit and all its valid claims to the use of half of 1% of oil as the upper limit of the invention, and (2) whether the Court by its decision in that case extended the patent to include the use of any and every oil having a preferential affinity for metalliferous matter over gangue, regardless of the function and operation of such oil and regardless of the results obtained. On the other side, the respondent (1) asserts that if the writ be issued, it will bring up for determination only one question, to wit: whether the patent covers the use of oil in quantities between one-half of 1% and 1%, and (2) denies the relevancy of the question whether oils inert in the process are to be taken into account in determining infringement. Moreover, the respondent asserts that there is no conflict of decisions, and that the case does not present any novel question of law.

"THE whirligig of time brings in his revenges." Little Serbia, bullied by Austria and then attacked at short notice under pretext of complicity in the assassination of the Archduke Franz Ferdinand at Serajevo, in Bosnia, on June 28, 1914, is about to be restored and to become the nucleus of a greater Serbia, which is to include Bosnia, Herzegovina, and, we hope, Albania, Montenegro, Croatia, and Dalmatia. On October 31 the kingdom of Greater Serbia was proclaimed at Serajevo and on the same day the surviving assassins of the Archduke were released from prison. Gavrilo Prinzip, the man that fired the fatal shot, died in prison a few months ago; he was an Austrian subject of Serbian race, and the assassination furnished no valid reason for Austria's brutal onslaught on Serbia. We know now that even as an excuse it was false, for the plan to attack Serbia and embroil Russia had been made by the two criminal governments of Germany and Austria two years before, according to the revelations made by Herr August Thyssen. Another of Time's revenges was the meeting between the British commander, Admiral Calthorp, and the Turkish plenipotentiaries at Mudros, on the island of Lemnos, on October 30, when the Turkish forces capitulated. It was at the port of Mudros that the British established their military and naval base at the time of the Gallipoli campaign in 1915. Mudros has a natural harbor ringed with hills "like a great extinct crater flooded by the sea," as John Masefield has described it. Before the War the town consisted of a few miserable shanties inhabited by Levantines, but on April 23, 1915, it saw a great fleet of transports crowded with soldiers about to start on a splendid adventure. "No such gathering of fine ships has ever been seen upon this earth, and the beauty and exaltation of the youth upon them made them like sacred things as they moved away." So wrote the poet. They failed gloriously and from their gallant effort came in due time the meeting between the British admiral and the Turkish bearers of the white flag.

CIRCULARS have been issued from Washington notifying those whom it may concern that Mr. Van H. Manning, as Certifying Advisor for the metal-mining and metallurgical industries (excluding iron and steel) has announced the organization of district representatives to take charge of the furloughing of men indispensable to the industries and already enlisted in the Army. Mr. Manning urges officials of companies to confer with the nearest District Certifying Officer in order that they regain the services of men essential to the production of war material, such as metals. Of course, should the War end shortly by the capitulation of the German armies, as is possible, it will be highly desirable to expedite the return to their normal occupation of all the technical men not already overseas. The District Certifying Advisors appointed are as follows: For the State of Washington, Conrad Wolfle, 217 Symons building, Spokane; for Oregon, Harold N. Lawrie, Oregon building, Portland; for California, Edwin Higgins, care of California Metal Producers Association, San Francisco; for Idaho, Frederick Burbidge, Wallace; for Montana, John Gillie, Butte; for Utah, Walter Fitch, 304 Boston building, Salt Lake City; for Nevada, Walter S. Palmer, University of Nevada, Reno; for Arizona, L. D. Ricketts, Warren; for New Mexico and western Texas, John M. Sully, Santa Rita; for South Dakota, W. J. Sharwood, Lead; for the Missouri, Kansas, Oklahoma zinc district, Percy B. Butler, Joplin; for the south-east Missouri lead and Kentucky fluorspar district, H. A. Buehler, Rolla; for the Wisconsin lead and zinc district, W. O. Hotchkiss, Madison; for the Michigan, Wisconsin, and Minnesota iron ranges,

George H. Crosby, Duluth; for the Michigan copper range, Frederick I. Cairns, Houghton.

Victory

During recent days the march of events has been so rapid as to leave us breathless and almost stunned by the weight of their significance. The absence of overt excitement has been remarkable; a visitor from abroad, say, Macaulay's apocryphal New Zealander, might easily have concluded that we were stolid to the point of stupidity. It may be that the prevailing epidemic of influenza has been partly responsible in so far as the compulsory wearing of gauze masks has checked conversation and hindered the recognition of acquaintances, while public ordinances have placed a ban on the assembling of groups or crowds inclined to celebrate the joyous news that has tumbled upon us from hour to hour; it may be that the long-drawn anxiety, particularly of the last seven months and the repeated shocks to our intelligence given by the bawling and often grossly misleading headlines of the daily press have deadened our sensibility to impressions. Whatever the causes, it is astonishing how quietly this community has received the news of events that will affect human affairs for centuries to come. As a soldier said to his comrade in the trenches: "Say, Bill, this is a great War: it is almost like one of those wars in history!" The long and short of it is that the Enemy is beaten irretrievably and the world has been saved from the jungle code of militarist savagery. The paranoiac dream of the German Headquarters Staff have been shattered, the Berlin to Bagdad ambition has dwindled to a Berlin to Bodenbach reality, the insolent propaganda of Kultur has been stultified for all time, the pentecost of calamity is near an end, the dawn of a new and more orderly world is breaking on the horizon. Our gladness is beyond shouting, our thankfulness exceeds the limits of speech. The people of America are taking these tremendous events soberly because, among other reasons, the more thoughtful of them realize that there is much yet to be done. The world has been liberated from Prussianism, but Europe is in danger of Bolshevism. As was foreseen by many careful observers, the destruction of the morale of the Central European armies is giving opportunity to the unbridled spirit of anarchy. From the capitals of the defeated powers, from Sofia, Constantinople, Vienna, Budapest, and Berlin there come stories of revolt and disorder; kings and emperors are being thrown into the discard; with them for a time is going constituted authority, and in their wake follow wild outbreaks of protest against the repression, suffering, and famine that dog the heels of unsuccessful warfare. At the time of this writing the government of Germany is still in the saddle, because the German armies are not as yet disintegrated, but it appears likely that, if an orderly capitulation is not effected, the principal Enemy may go the way of his dupes and vassals, to be overwhelmed in a whirlwind of long repressed popular revulsion against the unendurable horrors of war. For this sequel to his defeat we do not hope. The task that the Allies have in hand, in re-making the map of Europe to accord with national determinations and in measuring justice to the chief criminals at Berlin and Vienna, is big enough, in all conscience, without imposing upon them the further labor of managing the disorderly mobs that threaten to assert themselves on the ruins of Kaiserism. For that reason we hope that Germany will accept the terms of the armistice, not yet announced, because, if a moment of passionate insurgence should prompt the cry for a last desperate struggle by the German armies, the result of further fighting would be such punishment as to destroy their discipline and to sweep aside all remnants of government in a disorderly stream of armed men, reckless and desperate, as happened after the Russian debacle. Prussianism and Bolshevism are complementary; in ridding the world of one we have to face the need for curbing the other. The next few months are destined to be as memorable as those that have just preceded them, for the Allies now face the honorable and arduous task of reaping the fruits of victory by decisions so just as to ensure the restoration of civilization in Europe, and upon them also devolves the beneficent duty of bringing food and clothing to the victims of the great contest, even to those in the enemy countries. To this task, as to the fighting, the United States, we do not doubt, will devote herself with an idealism that has already gone far to prove how the American people can industrialize their lives without commercializing their souls.

Chromite

On October 31, Mr. Albert Burch, representing the War Industries Board in California, received the following telegram from Mr. Hugh W. Sanford, chief of the Chemicals Division of the Ferro-Alloys Section of the War Industries Board. "Referring my telegram September 27, which you had published. This seems to have caused misconception in minds of some chromite purchasers who have interpreted this telegram to mean that the Government was guaranteeing not only full consumption of chromite for balance of this year and first half of next year, but also that the guarantee was for sales during either or both periods at the price prevailing during the summer of 1918. This interpretation cannot properly be gotten from the language of the telegram. In order to clear up any misconception please have this complete telegram published. The War Industries Board does not at this time guarantee any sales of chromite for balance of this year or the first half 1919 at any prices. The War Industries Board has asked chromite users to buy as much domestic chromite as possible during the remainder of this year and may decide to request buyers to purchase domestic chromite for the first half of 1919 on some new price basis. It is impossible to say how fully the buyers will co-operate with such requests. Stocks in hands of users are large, particularly stocks in hands of users of high-grade ores. These stocks probably average ten or twelve months' supply. The over-supply of chromite today is due more

to decreased domestic consumption than to any other one factor. The domestic consumption being about 35,000 tons less than anticipated for 1918. This is due chiefly to the recent changes that have been made in the industries for the necessities of the war program, such as reduction in manufacture of automobiles, which industry formerly absorbed large quantities of ferro-chrome and also the use of less chrome tanning in the leather trade on account of vegetable tanned shoes being used largely in the Army for trench-work. A program has been recommended to the War Trades Board by the War Industries Board for a reduction of imports from all countries to the lowest practical minimum and their decision will probably be announced in a few days. The War Industries Board has also removed all restrictions on conservation of use of chromite and is not denying proper exports of chrome products. Serious consideration is being given by all governmental departments to this problem, but at present it is doubtful whether additional aid can be given to the domestic chromite situation beyond the procedure stated above. If any further developments will advise you." We give prominence to this telegram, unsatisfactory as it is, because we know the keen interest in the subject felt by many of our readers, particularly in California.

Freedom of the Seas

Before the rulers of Germany committed the greatest crime recorded in history the German mercantile marine sailed the seven seas and transacted a worldwide business, thanks to the 'freedom' whereby coaling-stations, harbors, and markets were placed at their disposal, as they were open to all others, particularly wherever the British and American flags floated. The mad attempt to win dominion caused these gateways and highways of the ocean to be closed to them. Now they whine about this loss of 'freedom' on the sea and demand the right to go where they will. What they would have done if they had vanquished the British navy, we can guess, having seen what their notion of 'freedom' meant to hapless neutrals on land. From that nightmare of savagery we have been saved, thanks to the descendants of Drake, Rodney, and Nelson, as also to those of Paul Jones and Farragut. During the four years of warfare Germany has lost half her mercantile marine, and if the vessels interned in neutral ports be held as indemnity for her pirate doings she will be left with only one-third her former shipping. While war has raged, however, she has made a tremendous effort to construct new ships, the total tonnage amounting to 850,000 tons, equal to about a quarter of her losses. In cynical disregard of foreign sentiment one new Hamburg-American liner is called the 'Tirpitz' and a new North-German Lloyd liner is named the 'Zeppelin,' leaving us to imagine how many travelers outside Central Europe will care to take passage on vessels so named. They may have been christened when the phrase 'freedom of the seas' meant to the Germans the exclusion from the ocean thoroughfares of any but their own ships, but by this time the shipowners of Hamburg and Bremen are disillusioned; their ambitious projects are doomed, and, what is worse for them, the German U-boats have called forth against them the condemnation of the Brotherhood of the Sea. They will not be forbidden the privilege of sailing the waters of the earth or to traffic between the ports of the world, but German ships for many years to come are destined to feel the bitter resentment aroused by German piracy during this war. The Allies do not need to wage an economic campaign after peace is declared; no government will have to formulate a boycott against German shipping; that will be undertaken quietly and persistently by sailor-men themselves. The Germans have violated all the traditions of the sea, they have outraged the deepest feelings of seafaring men, they have incurred the hate of every self-respecting tar from Salem to Singapore, from Bering's Sea to the Australian Bight. It is a fact that already the British Seamen and Firemen's Union and the Big Merchant Seamen's League have joined for the purpose of boycotting everything German, and this movement has spread among the seamen of the three Scandinavian countries, all of which have felt the brutal hand of the Hun on the waters. The murders, the deliberate drownings, the mockery of the wounded and dying, of women and children as well as of men, have made the U-boats and their German masters damnable and damned wherever seamen foregather. The list of crimes committed by them is long; the stories of the British ships 'Lusitania', 'Black Prince', 'Eavestone', 'Sussex', 'Persia', and 'Leinster', the American ships 'Gulflight', 'Nebraskan', and 'Ticonderoga', the French 'Amiral Ganteaume', 'Mimosa', and 'Lydiana', the Swedish 'Snetoppen', 'Varing', and 'Vanland', the Norwegian 'Rym', 'Gurre', and 'Einar Jarl', the Danish 'Dana', 'Betty', and 'Rosborg', the Dutch 'Gamma', 'Katwijk', and Tubantia', the Portuguese fishing vessels 'Rita Segunda', 'Flor de Abril', and 'Restaurador', the Belgian Relief ships 'Harpalyce', Ashmore', and 'Euphrates,' the hospital-ships 'Lanfranc', 'Donegal', and 'Warilda', are a few from the long catalogue of crimes recorded against the German submarines. Whether belonging to their enemies or to neutrals, whether engaged in the relief of the famished or in the transport of the wounded, it was all the same to the pirates in their campaign of frightfulness. They killed 17,000 men, women, and children, on non-combatant vessels, by methods not recognized in any warfare but that of Apaches, Dacoits, or Malays. The German chargé d'affaires, the now notorious Count Luxburg, sent a telegram to Berlin through the Swedish embassy asking that the small steamers 'Oran' and 'Guazo' from the Argentine "be spared or else sunk without leaving a trace." "Spurlos versenkt" will stink in the nostrils of every sailor for a hundred years. Under cover of neutral nationality they placed spies on ships. They played every mean trick and perpetrated every form of brutality. They are outcast from the Brotherhood of the Sea.

The Gold Standard

The Editor:

Sir—The War has shown us that paper credit can be stretched to any amount; I venture to suggest that the nations should agree to stretch the world's gold reserve in the same proportion as their paper credit and carry on.

The statesmen were unable to prevent the bloodshed of the last four years. Let us hope that the financiers will evolve a plan to steer us clear of panic when this war is over. The following suggestion may be the wrong way to do this, but it will serve to provoke useful discussion.

Let us first trace the history of gold money in England, as it was in England that gold was standardized by law. Gold and silver were the standards of value hundreds of years before gold was standardized.

The pound sterling was originally a pound-weight of silver divided into 20 parts, called 'shillings', and each of these into 12 parts called pennyweights or 'pennies'. In 1345 gold first appeared in the coinage of England. Edward III by royal decree fixed the rates of gold to silver at 12½:1 in this first coinage. During the next 256 years there were nine debasements of the silver coinage accompanied by changes in the gold coinage, all of which were the arbitrary act of the reigning sovereign. The last debasement was made by Queen Elizabeth in 1601. The pound-weight of silver was then coined into 62 shillings and the pound of gold into 33½ sovereigns of 7 dwt. 4 grains each, the ratio of gold to silver being 11:1. By 1663 gold had risen in value so that it was necessary to change the ratio to 14½:1. Each time a change was made in the gold coin a new name was given to it. In 1694 the Bank of England was founded and the issue of notes began. It is an interesting coincidence that industrial disturbances started at about the same time as paper money was introduced into England by the Bank of England. During the reign of William III the guinea passed for as much as 30 shillings. In 1717 Lord Liverpool said a marked preference was shown by the people for gold money rather than silver on account of its convenience in making large payments. In 1797 many of the nobility and leading citizens of England signed a document to the Privy Council pledging themselves to receive Bank of England notes in all payments of money and to support the circulation of them. This was done for patriotic reasons. In 1816 the character of the British money system was formulated on its present basis by Act of Parliament, the essential part of this Act being the following clause:

"Xi. And whereas at various times heretofore the coinage of this realm of gold and silver have been equally a legal tender for payment of any amount and great inconvenience has arisen from both these precious metals being concurrently the standard metal value and equivalent for property;

And it is expedient that the gold coin made according to the indentures of the Mint should henceforth be the sole standard measure of value and legal tender for payment without any limitation of amount and that the silver coin should be a legal tender to a limited amount only, for the facility of exchange and commerce.

Be it therefore enacted

That from and after the passing of this Act the gold coin of this realm shall be and shall be considered and is hereby declared to be the only legal tender for payment, except as hereinafter provided.....and no tender of payment of money made in the silver coin of this realm of any sum exceeding the sum of fifty shillings at any one time shall be reputed a tender in law."

In 1816 the Commissioner of the Treasury ordered that the King's receivers and collectors should receive the guinea at 21 shillings and 6 pence, or about $5.38. Shortly afterward it was legalized as 21 shillings by Act of Parliament.

From the foregoing it will be observed:

1. That the Government could and did alter the value of coin and that the people accepted the value placed on it by the Government.

2. That the gold standard was fixed on account of its convenience.

Today paper money has been accepted by the world in general on account of its convenience.

3. It was possible to alter the value of gold from time to time arbitrarily to meet conditions then existing. Why not do the same now for the same reason?

The stretching of the margin between the gold dollar in reserve and the paper dollar issued may necessitate an alteration, so as to lessen the margin. Possibly it may be found an advantage to change the value of the metal itself, but still retain it as the standard. Whatever happens, gold must remain the standard of value. In discussing this subject, one hears 'repudiation', 'confiscation', 'instability', 'panic', and 'want of confidence' mentioned, all of which leaves a nasty taste in the mouth. Talk of this sort must be cut out. We have to face the music and evolve a solid foundation of gold under the skyscraper of paper credit, which has been rushed up to accommodate war conditions, and which an earthquake in the form of a panic might topple over, causing distress

and ruin to humanity, which has already suffered more than enough through this war.

Theoretically, perfect solvency is one dollar gold in reserve for one dollar paper issued; practically, this is not possible today. It would appear that the road to safety lies in reducing the margin as much and as quickly as possible between the paper currency and the gold reserve. There are two ways of doing this and they can be combined:

1. For the world arbitrarily to alter the standard price of gold.

2. To stimulate the production of gold, that is, make existing gold do extra duty, encourage gold mining, and produce more gold.

As it was possible in bygone days to arbitrarily fix the gold standard to meet the conditions existing then, so it should now be practicable arbitrarily to fix the standard of gold to meet the altered conditions, by the unanimous agreement of the governments of the nations.

Mr. H. C. Hoover was able, in conference with the Allies, to arrange a common breakfast-table whereby we share and share alike. Why not have a financial conference of the nations, arrange to throw the war debts into a common pot and evolve an equitable basis for liquidating it? Before this is done war indemnities should be arranged and settled on existing gold-values. The Financial Conference would hold full power from the respective governments and would bind them by acts of the Conference. At this Conference it should be agreed:

1. The governments would guarantee to pass legislation calling in all gold by a certain date against which they would issue government securities. This law would be most stringent, imposing heavy penalties and confiscation for non-delivery of gold to the respective governments.

2. The new standard value of gold would be fixed by the Financial Conference of the Nations. It might be $40 per ounce, or any other figure that the Conference in its wisdom decided; provided it was accepted by the world, the figure would not matter.

If it was fixed at double what its value is today the governments, after collecting the gold reserve, would remint the gold so that a gold coin would represent twice as much paper currency as it does now. This would cut the margin in half. The Conference would fix the actual size and weight of the coins.

The greater the lessening of the margin between the gold dollar in reserve and the paper currency issued, the sounder would be the safety of the world's finance. This readjustment would automatically give the impetus needed for gold-mining production. If the new legislation favored gold mining too much, other legislation could be framed on a sliding scale whereby the gold mines could proportionately contribute to the liquidation of the war-debt. Under no circumstances would there be any reason to curtail the gold output, as the discrepancy between gold and paper will not be sufficiently reduced for generations.

Broadly speaking, gold does not circulate today in our business, but if it did it would be a convenience if when the bank issued a $20 gold-piece it was only the size of a $10 gold-piece. It would not be so heavy to carry and it would purchase the same as if it were the same size as now. There should be no complaint. The debt of the belligerent nations before the War was about $28,300,000,000. Today it is $165,000,000,000. The gold reserve of the world today is roughly $10,000,000,000, or 17,000 tons, and the annual production about $450,000,000, of which the Allies produce 91.3%, the Neutrals 8.1%, and the Central Powers 0.6%.

Before the War, for each gold dollar there were about three paper dollars in circulation. Today for each gold dollar there are about 15 paper dollars issued. To speak of raising the standard price of gold can hardly be called 'confiscation' or 'repudiation'. If it is, then your flour, sugar, etc., are and have been confiscated. When it was found that food control was wanted the people did not complain, because they recognized it was necessary and for the welfare of all. So also would they recognize any remedy that would promote stability of finance and prosperity in the world for the general good. Of course, if a world's international clearing-house were established at the same time, it would help to regulate international finance.

W. Karri-Davies.

San Francisco, October 28.

[This letter and the one that follows come from thoughtful men and should provoke useful discussion.—Editor.]

Helping Low-Grade Gold Mines

The Editor:

Sir—I venture to offer sundry suggestions as to action on the part of the United States and the Allied governments for providing easier war-financing by laying the foundation for a League of Nations, and at the same time improving the present situation of the gold-mining industry.

1. All the present existing gold (bar, coin, jewelry, or any other form), all by-product gold hereafter mined or refined, and all enemy gold of every kind, to be considered as necessary to take care of all present outstanding contracts that require payment in gold coin of the present standard of weight and fineness.

2. All gold hereafter mined from primary gold mines in the United States and Territories to have the option, either of going into the above classification by being sold to the mints or to manufacturers as at present, or else of going to the Federal Reserve banks at a higher price per ounce under the following conditions:

Any gold hereafter mined from any United States primary gold mine may be deposited in any Federal Reserve bank with a statement as to its place and date of production; and after such statement has been verified to the satisfaction of the bank's officials, then and then only to be paid for in Federal Reserve bank-notes at a special price per ounce. If such statement cannot be verified to the satisfaction of the bank's officials, then all gold so deposited to be forfeited to the bank, with no appeal whatever on the part of the depositor.

3. Gold deposited as above to go into the vaults of the Federal Reserve banks and thus be used as a basis for issuing bank-notes. The price per ounce to be paid for such gold and the ratio to be established for issuing paper money against it to both be worked out, accepted, and adopted by all the Allied governments, each government agreeing to treat its own new and primary gold production accordingly.

As practically all of the world's new gold is being produced from Allied territory, the foregoing suggestions should not only serve to mark up the price of gold now in the ground in Allied territory, for the purpose of increasing the value of an exclusive Allied product, but by multiplying this increased value by an issue of bank-notes, should also serve as a combined means of war-financing and of war-reprisal against enemy gold and enemy financing.

If the Allied governments could get together on this gold question and provide machinery for outlawing the paper money of any nation issued contrary to any detail of the agreement thus entered into, then they would in effect have launched a League of Nations on the practical basis of an appeal to the pocketbook.

Treadwell, Alaska, October 8.

Alienization

The Editor:

Sir—As an American of foreign origin, I understand and appreciate American ideals. I understand the mental bondage of the majority of European aliens in America. The 'Americanization' editorials appearing in your patriotic magazine hit the nail on the head. Nowhere in the United States has the alienization of an American community made progress as it has here in Alaska. With the opening of the Government Railroad, the Alaska Engineering Commission has shown to this present day a great preference for aliens that are foreign in language, ideals, and habits, often out-spoken anti-Americans, with a distinct hatred for American ideals and loyal Americans. Last fall in Camp 221, close to Talkeetna, all Americans were fired, to be replaced by aliens, Germans and Austrians. This spring, in the same camp, the opening of the work on this Government Railroad was marked by hiring every German and Swede in Talkeetna, and rejecting and not hiring one loyal American citizen here in Talkeetna. This discrimination against loyal Americans is and was a common occurrence on a project supposedly builded by and for the American people. Hyphenated pro-Germans and alien draft-slackers are put in charge of loyal Americans. Swedes and other aliens claimed exemption from the draft on account of not having an intention to become American citizens. They are not willing to fight for this country, but they are willing to take from American boys at the Front their jobs on an American government undertaking. The pioneers of Alaska, prospectors, miners, farmers, and merchants, in the environs of the Government Railroad, are leaving for the outside en masse. Today Anchorage, for a while the greatest town in Alaska, resembles an abandoned wild-cat mining camp. In the Matanuska valley three-fifths of the farmers left without taking the trouble to harvest their crops. The A. E. C. is paying, after a four months' service, on request, a premium of $68 to leave for the 'outside,' and if the A. E. C. is in need of labor next spring each of these stampeders will get another first-class free fare back to Alaska. To the honor of the Alaskan, it must be said that very few are taking advantage of this doubtful privilege for patriotic reasons. Only publicity will remedy the scandalous conditions created by the Alaska Engineering Commission.

HENRY LEGIN.

Talkeetna, Alaska, October 4.

[We are surprised to receive this description of labor conditions at Anchorage and hope that it is exaggerated. However, we deem it right to publish this protest, which appears to be made in good faith.—EDITOR.]

The Utah Copper Enterprise

The Editor:

Sir—Reading the fourth article of this series recalls vividly to my memory the following, which will be of interest to many of the earlier residents at Bingham.

In the year 1871 I was employed as a contractor at the Winnemuck mine. Al Bemis was the manager of the mine and small smelter, about half a mile below the town. The principal hotel was named Hotel Clark. Below it, and on the west side of the gulch, was a large rooming-house owned by Richard Predeux. George A. Jackson, one of the first miners to reach Central City, Colorado, during the Pike's Peak excitement, was placer-mining just above the Clark hotel, and close to the junction of the two gulches. Warren Hickman, son of Bill Hickman, a notorious Mormon character, was postmaster. A short distance above the junction, in the left-hand gulch, the post-office, main store, and Justice of the Peace were located. Some tunnels had been driven into the mountain, but abandoned at this time. Sol. Cleveland, a nephew of Jackson, was owner and manager of a boarding-house in Galena gulch. During a suspension of work on one of the mines, several miners continued to board with Cleveland. Cleveland entered into a verbal contract with two, who wanted to try prospecting. He was to furnish board, tools, and powder; they were to find a property and do the work.

About three months after the contract was made, a miner, returning from town, told Cleveland that his partners were about to sell a mine. The parties did not arrive at the boarding-house that night. About ten o'clock the next day Cleveland went to town, and soon learned that a trade was on for the mine at the office of the Justice of the Peace. He arrived there when the buyer was reading one of the papers that had been drawn up. Listening carefully, he learned that he was no party to the transaction. Excitedly, he told the purchaser he was a third owner in the mine, and no deal would be made unless his interest was recognized. Instantly one

of his partners denied the ownership, and invited Cleveland outside to settle the matter. Passing out of the door in advance of Cleveland, he grabbed a stone and poised himself to throw it at Cleveland, who shot him, and he fell over the steps of the office. Cleveland then entered and shot the second partner as he stood by the side of the Justice and the purchaser. He drew a second revolver from his boot-leg, and, with one in each hand, he walked a hundred feet up the gulch, and entered a tunnel driven into the side of the mountain.

By this time a crowd began to accumulate, and many were shouting, "Hang him," "Shoot him"! Among the number rushing up was Jackson, who was surprised to learn that the man wanted was his own nephew. "If you want the man," Jackson said, "I will bring him to you—but no shooting or hanging will be done until after he has had a fair trial. Now, if ten men will promise me they will escort him to the Justice's office, and allow him to have a fair trial, I will go into the tunnel and bring him out."

This was agreed upon, and in a few minutes Cleveland and Jackson came out, both heavily armed, and escorted between the ten men who had promised to protect him. They went to the Justice's office. A trial was held, and Cleveland was set free.

GEORGE KISLINGBURY.

Los Angeles, October 28.

Producers of Lead

The Editor:

Sir—Herewith a communication of which the letter to Lead Producers Committee is a part. I trust you may find it acceptable. The smelters are going to force operators to seek other markets and as for the American (capital) production in Mexico, its only outlet is Japan, whose representatives are now investigating the field.

It has been with gratification that the mine-operators have noted the many profiteering trusts and manufacturers fall under the control of the Government regulations and their prices and profits fixed. The gratification has been in the expectation that the Government would in due time take note of the real detriment to mining—the arbitrary method of the smelters and the smelting combinations in confiscating a large percentage of the mine products delivered to them for refining. The Government has now fixed the prices of the various minerals that the smelters shall receive, but there has been nothing done as yet to fix the price that the smelters shall pay to the miners who sell them the metals. It is my legal opinion that a judicial decision from a judge of the higher courts would say, in the case of the recent fixing of silver-values, that the smelters are guilty of not conforming to the prices, likewise as to copper.

The mine operator has no other alternative than to deliver his product to the smelters. The following letter to the Lead Producers Committee shows smelter methods exactly as they exist in respect to lead. Copper, silver, and gold are in the same boat. Based upon the tariff referred to, a shipment that I have just made shows as follows: Gross difference between the amount actually paid by the smelter and New York prices, $58.60, or net, after deducting smelting loss and bullion freight-charges to a shipping port, of $4.13, $53.87 per ton of ore. A total of $2154.80 per car of ore.

If the real producer, the mine operator, could get this profit, there would be no occasion for "stimulating" or asking a Government bonus on metals production.

S. L. PEARCE.

Alamos, Mexico, October 20.

[Here follows the letter to which Mr. Pearce refers in his communication to us.—EDITOR.]

ALAMOS, SON., MEXICO, October 19, 1918.

Lead Producers Committee,
Washington, D. C.

Gentlemen:

Quoting from the MINING AND SCIENTIFIC PRESS of date October 12:

"Lead. All the metal available, every ton and every pound, is under the strict control of the Lead Producers Committee, etc. There is at present no relief in sight on this score."

Apropos: The mines, not the smelters, being the 'producers,' who is retarding production, the producer or the smelter?

A late schedule from the American Smelting & Refining Co.'s purchasing department, compared with the market-value of lead, will furnish the answer. The producer must pay the smelter for treating his ore a flat rate of $6 per ton, plus penalties of a like sum; must present them with two units, 40 lb., plus 10% gross on each ton of ore, or for an average ore of 30% lead content, 600 lb., the smelter pays for only 500 lb. They make similar deductions on other marketable content of the ore, even imposing a penalty for some elements that are in urgent demand of the War Board. They get full pay for treatment of the ore, and force the producer to sell to them the 500 lb. of lead at exactly 0.03761c. per pound and they take 100 lb. and pay nothing for it. They pay no duties to the U. S. government on imported ore, but ship it in bond and sell direct to the foreign market. For one ton of 30% lead ore, they charge their own price for treatment. The net content of the ore is 600 lb. of lead, at New York price of 8.05c., or $48.30. They pay 0.03761c. for 500 lb., or $18.80. They do lose in treatment perhaps 2%, or 12 lb. of lead, 0.72c., and they pay about 0.6c. per 100 lb., or $3.53, freight-charges to port, yet there is a difference in their favor of $26.25 per ton, or $1050 per carload. Give the mine operator, the real producer, this highwayman's toll and there will be a surplus of lead to present to the Kaiser via the rifle-route.

If the Honorable Lead Producers Committee will place a purchasing agent at the smelters and pay the producers the price the smelters are receiving for the lead, it will solve the shortage very quickly. The one camp in which I am trying to produce, but am forced to throw 40% lead ore into the waste—would furnish thousands of tons of ore if the market-values could be had. *Spero meliora.*

S. L. PEARCE.

Smelting Cyanide Silver-Precipitate in Oil-Burning Reverberatory Furnaces

By K. A. CUNNINGHAM and ARTHUR FEUST

As a result of the embargo placed by the United States government on the exportation of graphite crucibles, operators in the Guanajuato district, as well as others in Mexico, found themselves face to face with the difficulty of dealing with their cyanide precipitate, which theretofore had been melted in crucibles. Several methods of disposing of the precipitate were available: First, it could be sold to the smelters; second, it could be smelted in one of the numerous brick-lined oil-fired tilting furnaces; and, third, it could be smelted in reverberatory furnaces.

The objections to the first method were several, among which were the difficulty in getting accurate samples, and the length of time necessary before final settlement is made, the smelters advancing only 75% on receipt of the precipitate, although lately they have offered 90%. Besides, consideration must be given to the packing in the transportation of a considerable volume of precipitate. The objection to the second method was mainly the small capacity of the different types of tilting furnaces, which also require a considerable expenditure of capital. The delay in receiving shipments from the United States, which nowadays occupies from two to four months, was also a serious drawback.

This brought the producers down to a consideration of using reverberatory furnaces, as was the case with the Mexican Milling & Transportation Co. The practice employed by this company, and the results obtained, are given below, together with drawings of the furnace employed. The furnace is practically identical with that of the Compañia Real del Monte y Pachuca, since D. S. Calland, managing director, kindly furnished the Guanajuato operators with drawings of the furnace used by his company. The chief difference between the Real del Monte furnace and that built by the Mexican Milling & Transportation Co. is that the latter is three feet shorter from the centre of the tapping-hole to the throat. Also, the base of the Mexican Milling Co.'s furnace is built of rubble masonry, whereas that of the Compañia Real del Monte y Pachuca consists of piers on which rails rest, supporting the bottom of the furnace. In the Pachuca practice the furnace was charged through ports in the roof, whereas in the practice of the Mexican Milling & Transportation Co. it was charged from the firing-end. After the rubble foundation was in place, a bed of brick-bats and lime and mortar was prepared, on which the firebrick was laid. As no arch-bricks were available, ordinary firebricks were cut to shape, the faces being rubbed so as to get as close a fit as possible. An extremely thin fireclay mortar was used in laying the brick, considerable care being exercised to avoid leaving any interstices. That this care was justified was proved afterward when the hearth was removed; it was found that the absorption of bullion and matte had been very small. After the roof-arch was in place, with both ends of the furnace bricked in, and the dust-chamber and the flue finished, a wood fire was started in the centre of the hearth. It was small at first but gradually increased. This was continued for 10 days, when the furnace appeared to be thoroughly dry; then the oil-burners were turned on for several hours each day for an additional four days. After this, the burners were turned on full blast, and the furnace was brought to a cherry-red heat, this being gradually raised to white-heat. At this point 300 kilogrammes of old slag was charged gradually, and the greater part of this was absorbed by the hearth. When the hearth refused to absorb any more slag, the burners were turned off, and the furnace allowed to cool. Inspection showed that the bottom was glazed, and that there were no openings or checks except in the roof-arch, but as this was afterward covered with sand there was little loss of heat.

A day or two before charging the furnace the hearth was painted with a thin solution of fireclay to fill any crevices, this operation being repeated before every succeeding melt. The furnace, now being ready, was operated regularly once a week during the months of April, May, and in the first week of June, the melts taking from 16 to 28 hours. Just prior to charging the furnace, the tap-holes—there being three in use, one for metal, and the other two for slag—were closed with adobe, and the tapping-bars were driven into place. These bars are one inch in diameter. We have found it advisable that before starting to draw the bar from the lower tap-hole, through which the metal comes, it is always better to drive it into the furnace in order to loosen any chilled metal that may have accumulated on the point. In our operations at the Mexican Milling & Transportation Co.'s property the slag was tapped after the molten mass had become quiescent, and as close to the metal as possible, then the heat was continued for about one-half hour in order to oxidize as much of the impurities as possible before tapping the metal. The slag was tapped into the conical molds formerly used for the slag from the crucibles; the molds being run away in specially constructed buggies. As soon as the slag in the molds was chilled on the outside, the molds were tapped so as to leave only the skulls, these being charged back in the next melt, be-

cause they are richer than the slag. The analysis of the slag is given in the table. The skulls, however, form but a small part of the total slag. The bullion was tapped directly into bullion molds, which were set on an iron truck running parallel to the furnace. With a little practice it is easy to decide as to the exact size of the bar necessary to give a stream of metal that can be controlled easily so as to avoid slopping over in moving the truck along. Unless there was a considerable quantity of matte produced in melting, we found it unnecessary to re-melt the bars, but there were occasions when the bars had to be re-melted on account of the tenacity with which the matte adhered to the bullion, it being practically impossible to remove it. During the last month in which the furnace was operated, but little trouble was experienced with the matte, notwithstanding the fact that concentrates were being cyanided. This accounts for the high sulphur content of the precipitate. The precipitate is not treated with acid nor is it roasted; the shorts, however, being screened and returned to the head-compartments of the zinc-boxes.

During the period of two and a fraction months a total of nine melts, consisting of 5331 kg. of precipitate, were charged. The precipitate produced 2529.254 kg. of bullion, distributed as follows:

Month	No. melts	Bullion, kg.*	Assay—Gold, kg.	Assay—Silver, kg.	Total contents—Gold, kg.	Total contents—Silver, kg.
April	4	1266.839	16.387	883.546	20.760	1119.334
May	4	1097.187	15.039	848.098	17.598	930.524
June	1	165.228	15.360	868.345	2.538	143.475
	9	2529.254	16.169	867.186	40.896	2193.333

*1 kg. = 32.15074 Troy ounces.

The chief anxiety of the operators employing reverberatory furnaces was as to the amount of loss in dust and through absorption into the hearth. After a run of a trifle over two months it was decided to take up the hearth and clean the dust-chamber, so as to ascertain exactly what these losses were. The results of this investigation are as follows:

Final Clean-up of Reverberatory-Furnace Hearth

Product	Weight, kg.	Assay—Gold, kg.	Assay—Silver, kg.	Contents—Gold, kg.	Contents—Silver, kg.
Metal bars (3)	86.669	16.938	837.968	1.468	75.746
Concentrated brick	1080.000	0.024	3.566	0.026	3.851
Matte and slag	206.600	0.1167	13.418	0.024	2.772
				1.518	82.369

Of the metal recovered in the final clean-up 46 kg. was in one slag frozen just inside the tap-hole, and although this was regarded as a part of the absorption, it really was actual bullion produced. From the foregoing figures it will be seen that the absorption by the hearth is equal to 3.57% of the total gold content and 3.61% of the total silver content of the products recovered. Almost all this absorption occurred in the first and second melts. Likewise, as the operating crew became more experienced, the time required per melt was reduced from the original 28 hours to 16 hours required on the last melt. This time was reckoned from the beginning of the clean-up of the zinc-boxes, the precipitate being charged from time to time as fast as the furnace was sufficiently heated. The precipitate, when charged, contained an average of 40% moisture. The clean-up of the dust-chamber, which is divided into two sections, gave a total of 8 kg. Of this amount 5 kg. was recovered from the chamber following the fire-bridge, and assayed 150 gm. gold and 10.920 kg. silver per metric ton, (1 kg. per metric ton = 29.1755 Troy oz. per Avoirdupois ton). The second chamber, parallel to the furnace, gave 3 kg. of flue-dust assaying 76 gm. of gold and 8.124 kg. of silver per metric ton. It will be seen from this that the percentage of loss from dusting is practically negligible. A typical analysis of the precipitate follows:

Analysis of Precipitate, M. M. & T. Co.

	July, %	August, %
Silver	48.33	49.65
Gold	0.88	0.89
Lead	0.87	0.70
Copper	8.82	7.10
Insoluble	5.40	5.80
Iron	1.16	1.30
Alumina	0.53	0.48
Manganese	trace	trace
Lime (CaO)	3.52	4.55
Zinc	15.50	15.60
Sulphur	11.54	11.09
Loss and undetermined	3.45	2.84
	100.00	100.00

The fluxes used in the reverberatory furnace during the nine melts, and the equivalent percentages, are shown below:

Fluxes

	kg.	%
Borax glass	467	8.76
Soda ash	674	12.64
Broken glass	679	12.73
Lime (CaO 50%)	113	2.12
	1933	36.25

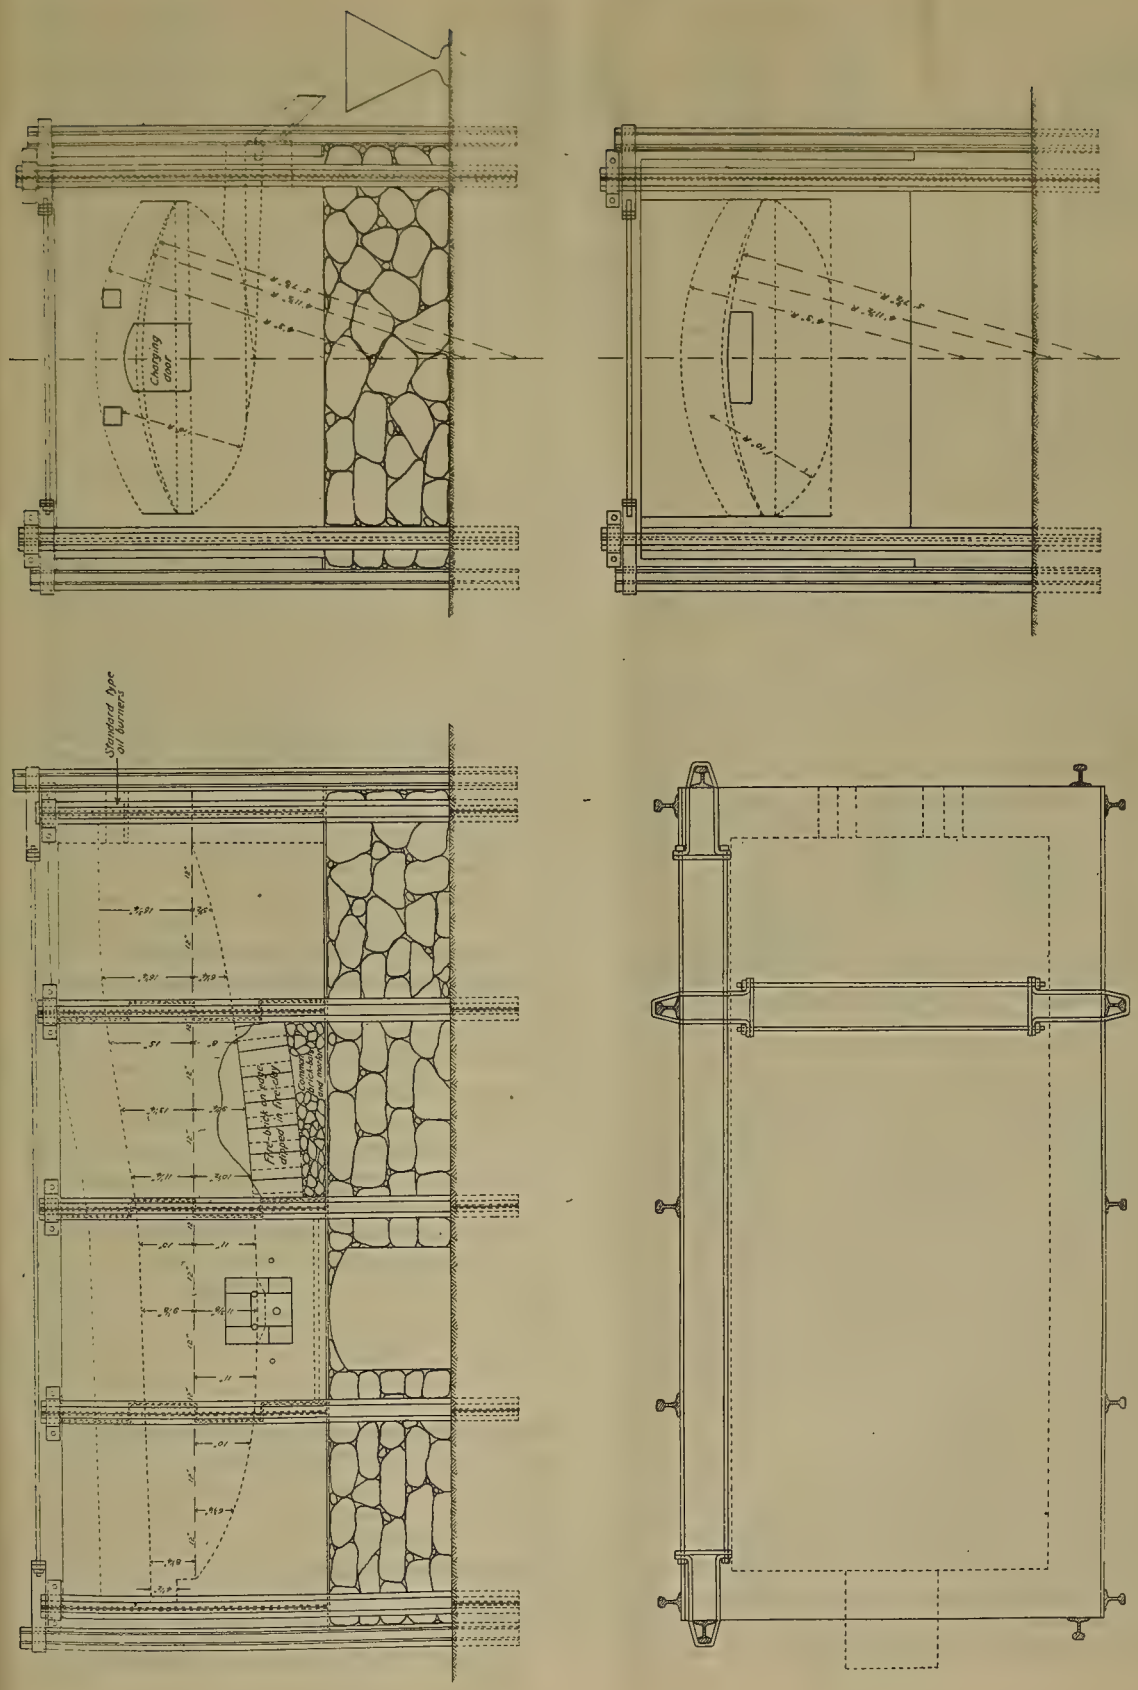
During the nine melts there was consumed a total of 8100 litres of Mexican gas-oil, which costs 5 cents U. S. currency per litre at the mill. This is equal to 3.569 litres of gas-oil per kilogramme of bullion produced. In order to make a comparison of the reverberatory method of reducing precipitate with the melting in crucibles, from a standpoint of fluxes consumed, the following record of the amount of fluxes used during the month of July, in melting 2033.4 kg. of precipitate, which produced 1065.345 kg. of bullion, is appended:

Consumption of Fluxes

	kg.	%
Borax glass	178	8.750
Soda ash	269	13.229
Broken glass	530	26.064
Lime (CaO 50%)	51	2.508
	1028	50.551

This precipitate was melted in four No. 250 Japanese graphite crucibles, costing $60 U. S. currency per crucible. These crucibles are nearly equivalent to a Dixon No. 275. The amount of gas-oil consumed was 3660 litres, equal to 3.436 litres per kilogramme of bullion produced.

In addition to the fluxes used above, iron was supplied to the slag in the form of old pieces of wrought-iron pipe. This was added in the reverberatory and in the crucible melts. Typical analyses of the two types of slag, that is, the reverberatory and the crucible-slag, are appended, and from these it can be seen that the reverberatory gave a far cleaner slag.



REVERBERATORY FURNACE FOR TREATING CYANIDE-PRECIPITATE

Analyses of Slags

	Crucible slag, %	Reverberatory slag, %
Gold and silver	0.014	0.003
Lead	0.28	0.35
Copper	0.15	0.10
Silica	32.12	31.34
Iron (FeO)	5.50	4.25
Aluminum (Al)	0.80	0.60
Lime (CaO)	9.10	8.10
Zinc	17.12	16.50
Sulphur	21.66	23.05
Sodium (Na)	2.77	3.00
Boron (B)	2.60	2.81
Loss, oxygen, etc.	7.886	9.897
	100.000	100.000

While the analyses of the slags are almost alike it will be noted that the amount of broken glass added, when melting in the crucible, was more than double that used in the reverberatory furnace, since the reverberatory furnace-slag derived its SiO_2 from the hearth. This was deduced after considerable experimenting to find the best quantity in order to prevent the precipitate from attacking the crucibles. The average crucible lasts from three to four melts. The bottoms of the crucibles are protected by several firebrick at the point where the flame from the burner impinges, but it is notable that the majority of the crucibles that fail in less than three melts do so at the point where the flame strikes them, while the others, as a rule, cut through at the slag-line.

As the result of the work done at the Mexican Milling & Transportation Co.'s plant, the following conclusions were reached: First, there is a big saving in the melting in the reverberatory as against crucibles at the present high prices; second, a cleaner slag with a higher grade of bullion can be produced than when melting in crucibles; third, a considerable saving can be made in the amount of fluxes consumed, although the consumption of oil was a trifle higher on account of the amount of heat absorbed by the furnace; the oil used would be less if the furnace were running steadily; fourth, when using the reverberatory one is not dependent on the receipt of crucibles, the arrival of which is irregular, to say nothing of the troubles and losses from broken crucibles and the consequent mess that they make when they cut through. Were it not for the fact that this plant is running on a close margin, and that it is impossible to hold bullion in suspense, as is unavoidable in operating one of these furnaces, the practice outlined would be continued without hesitation. The total cost of the furnace, with the dust-chamber, including the firebricks, which are manufactured in Mexico, in addition to the castings, rails, tie-rods, and accessories, was $1045.15 U. S. currency. This figure does not include the cost of the stack, as a charcoal-furnace already erected was employed; neither does it include the bullion or slag-molds, which were on hand.

PREPARATION OF COLLOIDAL GOLD. New glassware should be employed and should not be used for any other purpose. After cleaning with soapy water it is rinsed with aqua regia, then filled several times with tap-water, and rinsed, and then with triple-distilled water just before using. The water should be triple-distilled from a block-tin condenser without rubber connections. Place 1000 cc. of the water in a 2-litre flask, add 10 cc. of 1% $AuCl_3$ solution and 7 cc. of 2% K_2CO_3 solution. Heat rapidly to boiling, remove from the flame, and, with constant agitation, add 4 cc. of 1% HCHO; continue the agitation while the color passes through blue and amethyst to red. This is the final product, and should conform to the following requirements: It should be bright orange-red or salmon-red in color, neutral in reaction, and 5 cc. must be completely precipitated by 1.7 cc. of a 1% solution of NaCl in one hour. If the solution fails to work properly it should be discarded and, after thorough re-cleaning of all glassware, another solution made up. It is usually a waste of time to try to 'correct' a poor solution.

Tungsten in China

A United States 'Consular Report' dated August 31, at Hongkong, says:

"Predictions made in reports from this office a year ago that the deposits of wolframite in southern China, including an area in the colony of Hongkong, would prove to be one of the most important additions to the world's supply of this ore discovered in recent years, have been amply fulfilled by the development. Shipments of ore from Hongkong alone, not including Canton, Swatow, and other points made through Shanghai and other trans-shipment ports, have totaled $1,831,590 (U. S. currency) so far for the current year. The ore generally is valued at $1000 per ton. Shipments during the first quarter were $124,286; for the second, $696,899; while for the first two months of the third they were 2,016,388 lb., valued for invoice purposes at $1,010,405. Shipments may now be said to be in full swing. The number of Chinese interests involved in the collection of the ore in much of the Kwangtung, Kwangsi, and Hunan provinces has increased until there is a veritable boom in the business, while the industry has proved to be of immense benefit to Chinese labor, whose ordinary occupations have been interfered with by the shutting-off of exports in other lines. The ore is generally found in isolated deposits or pockets scattered over a wide area. Various systems of managing the mining have been tried, with the result that at present by far the greater part of the ore is purchased by middlemen from Chinese operators who manage the mining and secure and deliver the ore in Hongkong, Canton, or Swatow in their own way. Even where deposits are owned by the exporter of the ore the mining is generally done on a 'piece' basis."

GOVERNMENT reduction plants in Western Australia have aided development of small mines to a considerable extent. To the end of June 1918, these works (stamp-mills) had crushed 1,172,829 tons of ore, yielding gold worth £4,142,588 ($19,886,000) by amalgamation, £600,794 ($2,880,000) by cyanidation of sand, and £173,406 ($830,000) by slime treatment. Also 74,415 tons of tin ore yielded oxide worth £89,550 ($430,000). The total extracted by all processes is £5,006,599 ($24,026,000).

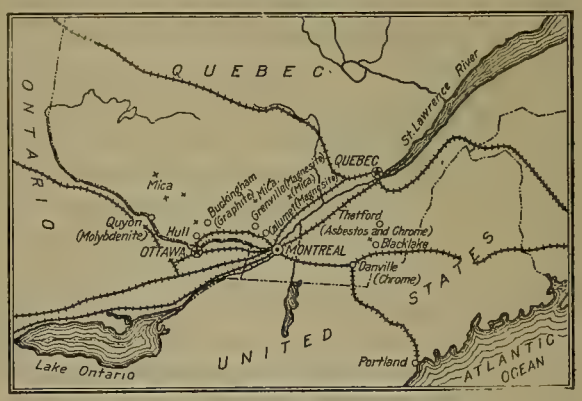
Asbestos, Chromite, Graphite, Magnesite, Mica, and Molybdenite in Quebec

*Quebec is a large producer of these important, but not generally abundant minerals. The following review of the production in 1917 reveals how great has been the stimulus due to the demands of war.

MAGNESITE: During 1917 the magnesite marketed by operators in Quebec reached a total of 58,340 tons, valued at $729,025. This quantity represents crude, calcined or caustic, and dead-burned or sintered magnesite. Had the magnesite been all marketed as crude the quantity would have been about 64,000 tons. The Scottish-Canadian Magnesite Co., whose quarry is situated in Grenville township, worked steadily all the year. The quarry is now connected with the C. P. R. line by a narrow-gauge railway 13 miles long, which joins the main line at the junction point called Magnesite, five miles east of Calumet station. The main excavation measures 150 by 30 ft., and the depth is approximately 40 ft. The equipment is adequate for a production of 150 tons per day. Some of the ore is shipped to the plant of the Canada Cement Co. at Hull, where, by an agreement between the two companies, the Scottish-Canadian Magnesite Co. is using with good results the cement-kilns for the production of dead-burned or sintered magnesite. For this purpose, the raw magnesite is broken by a gyratory crusher, and mixed with iron ore, so that the sintered product may contain 8% of iron oxide (FeO). The iron ore used is a magnetite from the Forsyth mine, at Ironside, near Hull. From the crusher the mixture goes to a ball-mill. It is then fed into a cement-kiln in which the temperature reached 2400° F. The sintered magnesia is in nodules one inch in diameter and less. After cooling, it is put into bags.

The North American Magnesite Co. operated its quarry, known as the McPhee mine, in Grenville, also the Dobbie property in Harrington township, which it leased from the International Magnesite Co. The quarry on the McPhee is now 150 by about 90 ft., and has a depth of 50 ft. There is a calcining-kiln at the mine, producing caustic magnesite which is used in the chemical trade. The product of the kiln, 10 tons per day, is shipped to the United States. The North American company rented the Vulcan mill of the Canada Cement Co. at Longue-Pointe, and is now producing dead-burned magnesite. The raw magnesite is mixed with some of the Hull magnesite to supply the bonding medium, as in the case of the operations of the Scottish-Canadian Magnesite Company.

It is undeniable that the development of the Quebec magnesite industry is due directly to the War. For refractory purposes, such as for bricks used in lining furnaces, there existed a strong prejudice against the Quebec magnesite, owing to its rather high content of lime, which is 5 to 12%, and to its lack of cohesion under high temperature. This lack of bonding quality, from which the Austrian magnesite does not suffer, is due to the almost total absence of iron. The Austrian product contains from 5 to 10% of iron oxide, whereas the Quebec magnesite is much lower, as a rule not exceeding 1½%. It might be thought that the lack of iron oxide could easily be remedied by the addition of some iron ore, such as limonite, hematite, or magnetite, but it appears that the iron oxide in the Austrian magnesite is in a state of fine



PART OF QUEBEC, SHOWING ASBESTOS, CHROME, GRAPHITE, MAGNESITE, MICA, AND MOLYBDENITE AREAS.

division, or dissemination, which cannot easily be duplicated in a mechanical mixture, this imparting a particularly good bonding quality when submitted to the heat of the furnace. After a great deal of experimenting, the Steel Co. of Canada, at Hamilton, Ontario, evolved a satisfactory method of using the Grenville magnesite for the bottoms of its hearth-furnaces. After calcining the crude magnesite, it is broken into half-inch pieces, and mixed with 15% of a blast-furnace slag containing 15 to 20% iron oxide and 50% lime. The furnace to be lined is heated to a temperature sufficient to melt the slag, and the mixture of slag and calcined magnesite is spread over the bottom in thin layers until the required thickness has been attained. During the operation of lining the temperature of the furnace is kept at 2700° F. From a communication received from the Steel company, it appears that the results are quite equal to those obtained from Austrian magnesite. As to the walls of the steel furnaces, F. R. McKune, of this company, obtained satisfactory results when using a mixture of dead-burned Grenville magnesite, caustic magnesite, and magnesium

*Notes from Annual Report for 1917 of Theo. C. Denis, Provincial Superintendent of Mines.

chloride. This mixture forms a plastic mass, which can be applied with a trowel to the walls of the furnace and allowed to set for 24 hours. Heat has to be applied gradually. This replaces the magnesite brick of which such walls are usually built. As to the manufacture of brick from Quebec magnesite, it has been stated that lime in magnesite will cause the dead-burned article to absorb moisture and to slake to a harmful extent. A series of tests showed that the Canadian dead-burned magnesite, carrying as much as 16% of lime, does not slake to any extent, even after fine-grinding and prolonged exposure to moist air.

MOLYBDENITE: The Quebec molybdenite industry made much greater progress during 1917 than the figures of production indicate. Much of the work during the year, such as the exploration, diamond-drilling, and improvement of concentration methods, is not reflected in these figures, but will, without doubt, appear prominently in the 1918 production. The total quantity of molybdenite produced in the Province was 226,739 lb., valued at $238,-096. This comprises various grades of concentrate, some of which sold as high as 95%; but most of the molybdenite that was marketed assayed 75% and higher. In May 1917 the Moss mine, near Quyon, which had been developed with such good results in 1916 by the Canadian-Wood Molybdenite Co., was acquired by a syndicate, representing strong United States interests. The Dominion Molybdenite Co. was organized with a capitalization of $5,000,000, to operate it. A great deal of work has been done since they acquired it. From June to October, 12,000 ft. of diamond-drill holes were put down, under contract, by the E. J. Longyear Co. The results of this exploration are said to have been most satisfactory, and a large reserve of ore has been blocked. Numerous experiments were made on the concentration of the ore. The Wood flotation machines, installed by the Canadian-Wood Molybdenite Co., yielded a concentrate of comparatively high grade, but with low recovery. After a series of tests, the Callow process was adopted, and a mill capable of dressing 150 tons of ore per 24 hours was erected. The results have been satisfactory. The mill practice is as follows: From the coarse rock-bin, the ore passes over a grizzley, the oversize going to a 10 by 20-in. and the undersize to a 9 by 16-in. crusher. The crushed rock is stored in a 200-ton bin, from which it is fed to a Marcy mill. From there it goes to a Dorr duplex classifier, then to four Callow roughers, which effect a first separation into concentrate and tailing, the latter going to the dump. The concentrate then goes to two Callow cleaners, which separate it into heading and middling, the latter returning to the roughers, making thereby a closed-circuit. The concentrate is de-watered, dried, and sampled. During the year 1917 practically the whole production of the Quyon mine was taken by the Imperial Munitions Board. The Wood Molybdenite Co. acquired a promising prospect in Huddersfield township, and actively pushed the development in 1917. The company erected a small mill for concentration of the richer ore. J. A. Bancroft was commissioned by the Quebec Mines Department to make an examination of the mode of occurrence of the molybdenite deposits in Huddersfield.

CHROMITE. The production of chromite shows that 36,186 short tons, valued at $498,031, was produced during 1917. This is greater than the quantity actually shipped to the consumer, as a proportion represents low-grade ore of 12 to 25 or 30% Cr_2O_3, sold by miners to concentrators, where it was enriched to 45 or 50%. The quantity that reached the consumer was about 23,000 tons. These figures constitute a new high record. The Mutual Chemical Co. of Canada operated successfully its Black Lake concentrator as a custom-mill through the year. This plant was overhauled in 1916, and consists, in the main, of a 9 by 15-in. Blake jaw-crusher, reducing the ore to 2 in.; thirty 950-lb. stamps, which reduce the ore through 20-mesh screens; and seven Wilfley tables. The capacity of the mill is 70 tons of ore, averaging between 12 and 15%, from which approximately 66% of the chrome content is recovered as a 50% concentrate.

GRAPHITE. The production of graphite in Quebec also reached record-figures, both in quantity and in value. They show 1,078,000 lb., valued at $99,024, an average of 9.2c. per pound. This is an increase of 12.6% in quantity, and of 30.7% in value, when compared with 1916. The production of graphite in the province of Quebec was restricted to the vicinity of Buckingham. The Plumbago Syndicate, consisting of Toronto men, operated its mines and mill for seven months, shutting down in August 1917. This was necessitated by a combination of circumstances, namely, the scarcity and inefficiency of labor, the shortage of coal, and the unsatisfactory results obtained by the method of concentration employed. The Syndicate took over the properties of the Dominion Graphite Co. in the latter part of 1914, and for more than a year and a half H. P. H. Brumell was in charge of the operations. When he left in 1916 for Alabama, R. E. Leighton of Montreal was appointed consulting engineer, and he carried on extensive experiments in the dry concentration of the ore. In August 1917, when the property was visited by an official of the Bureau of Mines, the mill was treating 50 tons per diem of graphite-bearing rock, the graphite being disseminated in sillimanite gneiss and adjoining crystalline limestone. From this it was claimed that four tons of shipping product was recovered. The graphite produced consisted of No. 1 flake, assaying 90% plus of carbon; No. 2 graphite, assaying 60%, used for lubricants; and No. 3, fine graphite for foundry use and for the manufacture of paint. The ore fed into the mill was reported to contain an average of 14% graphite. The mill used is the one that was constructed by the Dominion Graphite Co., and the ore as it comes from the mine goes over a grizzley. The lump ore goes to two masonry drying-kilns, and the fine goes to a rotary-dryer. The dry ore is then crushed, put through trommels and over sizing-screens, through roll-crushers, over dry separating-tables, and the graphite is finished between stones and bagged. The process being dry throughout, the dust that permeated the whole mill

was a great inconvenience. The plant finally was shut-down at the end of August, although it is claimed that the products obtained were satisfactory. The company is now testing oil flotation, and if the results prove satisfactory, the system will be discarded. While in operation, during the first part of the year, there were 60 men employed, of whom 11 were in the mill.

The New Quebec Graphite Co., a British company, worked throughout the year. The mill was constructed in 1913 by the Quebec Graphite Co., the predecessors of the present company. The concentration process is a wet one, and seems to give satisfactory results. It is based on careful sizing. The ore is broken in jaw-crushers, passes through rolls, after which it is pulverized in a ball-mill. The product is carefully sized in trommels in double series, giving three sizes, which are sent to hydraulic classifiers. This is followed by treatment on 16 concentrating tables (Krupp-Ferraris). The concentrate containing 60% carbon is then de-watered in a large cylindrical-vacuum vessel, the bottom of which has a fine-mesh metallic cloth, through which water is drawn by suction. The de-watered concentrate is shoveled to trays placed in tiers on trucks, which are wheeled into a long drying-room where the remainder of the water is evaporated. The concentrate then passes through a 'Sech' pulverizer, which consists of a series of highly-polished steel rolls which crush the impurities. These are eliminated by passing over a table with bolting-cloth, and the product is a graphite concentrate containing 80% or more of carbon. The power is supplied by a 160-hp. Diesel engine, burning crude oil.

Mica. The figures, compiled from returns received at the Quebec Mines Branch, show that 1,531,629 lb., valued at $281,234, was marketed. It is rather difficult to present systematic statistics of the production of mica, owing to the diversity of products and to the divergence in prices. The mica is marketed in several forms, of which the chief are thumb-trimmed, thin-split, scrap, and pulverized. Scrap and pulverized mica bring from ½ to 2c. per pound, whereas large sheets of thumb-trimmed sell as high as $2. The thin-split mica, which is split into sheets of 1/1000 to 2/1000 inch thick, that is, about the thickness of ordinary paper, represents a further stage of preparation. Only small sheets, under 1 by 3 in., are thin-split, being used for the manufacture of 'micanite,' which is a plate built up of small thin pieces of mica cemented by shellac and submitted to hydraulic pressure. The ruling prices for mica toward the end of 1917, for standard sizes, thumb-trimmed, were as follows, per pound:

Inches		Inches	
1 by 1	$0.08 to $0.10	2 by 4	$0.60 to $1.00
1 " 2	0.12 " 0.16	3 " 5	1.30 " 2.00
1 " 3	0.18 " 0.30	4 " 6	1.70 " 2.50
2 " 3	0.35 " 0.55	5 " 8	2.25 and over

Asbestos. The total quantity of asbestos-bearing rock mined and hoisted during the year was 2,634,410 tons. The value of the asbestos obtained from it, including stocks on hand at the end of the year, was $8,120,409. This represents $3.08 worth of asbestos from each ton of rock. In 1916, 1915, and 1914 the corresponding values were $2.13, $1.46, and $1.44. The production of asbestos was 137,242 tons, valued at $7,198,558, compared with 133,339 tons valued at $5,182,905; the average price per ton rose to $52.45; in 1916 this was $38.87; in 1915 it was $31.33; in 1914 it amounted to $26.96; and in 1913 was represented by $28.04. From May 1, 1917, the only royalty on asbestos, payable to the Provincial government, was 2% of the gross value of the mineral extracted. Fourteen companies were operating. At the King mine of the Asbestos Corporation of Canada, extensive alterations, both in the mine and the mill, begun three years ago, have been practically completed. The large covered storage-bin for the dried rock, with a capacity of 25,000 tons, is now being used. It feeds the mill by means of conveyor-belts. The new crushing and drying-plant is also in operation. It includes two 32 by 72-in. jaw-crushers, with a capacity of 100 tons per hour, having vertical dryers. The rock hoisted from the pit passes through the crushers, and thence through the dryers. It falls into the boots of bucket-elevators and is raised to the upper part of the bin, in which a conveyor-belt distributes it evenly. The contents of the storage-bin are discharged at the bottom by a series of openings upon a belt that feeds the mill. In the east Broughton field, the Quebec Asbestos Corporation, after extensive alterations to mill and mine, began producing in May 1917. The cable-derricks have been discarded, and the rock is handled in the pit by steam-shovels and cars, which convey it to crushers in the pit-bottom. The crushed rock is then brought to the surface by elevators and dropped upon a conveyor-belt, which discharges into the dryer-bins. The asbestos industry employed a total of 3154 men.

Metal turnings and borings from lathes at mines are generally thrown away, unless they are sold as old metal. This material always contains a good deal of high-grade oil, which should not be allowed to go to waste. The turnings may be put in a sheet-lined receiving-truck, having a sloping bottom to allow of their draining. Then they are placed into an oil-separator—steam-heated or centrifugal type—which reclaims most of the remainder of the oil. A large milling machine company at Cincinnati recovers an average of 100 gal. of oil daily.

'Fatigue' is a term used to embrace collectively the phenomenon of deterioration of material due to continued stress beyond the elastic limit, to repeated shock or vibration caused by mechanical braking or slipping, to sudden or continued change of stress (even below the elastic limit), either of the same kind, as from one intensity to another, or of opposite kinds, as from tension to compression or the reverse.

Powdered coal constitutes 85% of the fuel used in calcining 93,500,000 barrels of cement made in America during 1917. This industry alone consumed 5,000,000 tons of powdered coal last year.

Chrome and Manganese in Cuba

*In order to utilize nearby sources of these essential minerals, it was decided to obtain authentic and detailed information as to the location, character, quantities, and availability of the reported chromite and manganese deposits in the West Indies. A beginning was accordingly made in Cuba by a party consisting of Albert Burch, of the U. S. Bureau of Mines, and Ernest F. Burchard, of the U. S. Geological Survey. This party left Washington, February 15, 1918. At Habana they were joined by E. I. Montoulie, a Cuban mining engineer, who was detailed by the Treasury Department of Cuba to act as escort and associate throughout the work on the island. George A. Wright, of Baracoa, Cuba, an American engineer familiar with the chromite deposits of the province of Oriente, was attached to the party from February 25 to March 20. The field work, which was completed late in April, included examinations of such reported deposits of chrome and manganese that seemed to be of promise, without regard to stage of development, and a determination of the quantity and quality of ore likely to become available for shipment within the next year and a half.

The engineering data and the tonnage, estimates in part, in the following brief reports on the chrome and manganese ores of Cuba are taken from an unpublished report made by Albert Burch to the director of the Bureau of Mines. All the analyses except two were made by R. C. Wells, of the U. S. Geological Survey.

The reserves of marketable chrome ore in Cuba range from 92,500 to 170,000 long tons, but only 2000 tons can probably be shipped in 1918, unless greater efforts to exploit it are made. The largest known deposits of chromite are in Cuba—those of the Caledonia, Cayoguan group, and Potosi claims—are near the north-east coast of Oriente, in a region difficult of access. They may yield 72,500 to possibly 130,000 tons, most of which can be brought to present commercial grade by simple concentration. With suitable transportation facilities and mining equipment and sufficient labor most of this ore could be mined and shipped within two years after these conditions had been established. At the time of the examination only one deposit was ready for production and on a small scale, but it seemed that the rate of production could be greatly increased by the employment of more miners and pack animals. It would require some time to put the other deposits in shape for production.

The next largest known group of deposits is near Camaguey. They are easy of access but are of lower grade than those in Oriente province. They appear to contain 20,000 to 40,000 tons of ore, most of which can be gathered by hand from the surface.

Near Matanzas, Cardenas, and Holguin there are small stocks of ore that are ready for shipment, perhaps 1000 tons in all. The ore near Holguin is of medium grade, but that near Matanzas and Cardenas is generally of lower grade. The expense of hauling the ore is reported to be almost prohibitive.

Despite the handicaps of climate, shortage of labor, and explosives, poor transportation facilities and marketing conditions, the operators of manganese mines are striving to increase their output, and there is a strong interest taken everywhere in Cuba in developing manganese prospects. If railway cars and ships are provided for transporting the ore, food for the mine laborers, and explosives for blasting, the outlook for a steadily increasing production in 1918 and 1919 is good. It is believed that the total output for 1918 should be between 110,000 and 125,000 tons, more than 90% of which will contain from 36 to 45% Mn, the remainder being of still higher grade. After the completion of a narrow-gauge track to certain important mines east of Cristo, in the Santiago district, in the summer of 1918, an increased output in 1919 is assured. The reserves of manganese ore in Oriente province are estimated at 700,000 to 800,000 tons, more than 85% of which are in the district north-east of Santiago.

*Abstract from U. S. Geological Survey Press Bulletin 380, Sept. 1918.

A Letter From the Front

A few days of rest and peaceful marching in a beautiful country, two memorable swims in a broad cool river in an amphitheatre of hills, villages, and small imitation chateaux, one supper in a near-by town with a few friends and a little wine, and the over-strained and one-sided frame of mind in which I last wrote to you has entirely disappeared. Life, I suppose, and the War and politics and social and personal relations are all precisely the same today as they were four weeks ago, but to me they seem entirely different. Everything seems silly and pretentious, and less worth taking seriously (except outwardly in order to get along and to avoid unnecessary trouble) now that I have seen how short a step it is from life to death and how brutally human beings shove each other across the line.

As a little automatic-rifle man from Alabama said to me one morning in a wood full of corpses: "I've got the inclination to go on. I ain't unwilling to die, if need be —but I do hope I can get through this, so as to tell about my experiences on the field of battle." I think he had in mind some vague scheme for influencing future generations in favor of Peace. Not, of course, that he pretended to any doubts of the necessity or justice of our present war, only his own point of view as to the seriousness of it had so changed that he felt posterity should be set straight on the point.

The corner of the woods where I was talking to this soldier was honey-combed with small holes, each big enough for two men and each at that moment tenanted by two dead Germans, the remnants of their last day's rations of black bread, their few books and small correspondence, and, except where our men had taken it, their machine-gun. The ground in front of them was not badly sprinkled with dead Americans with their helmets and packs on. The night before the little rifleman's regiment had taken the place, mainly with the bayonet. The young Alabaman spoke in the quiet disinterested tone of one who is convinced of the vanity of things.

I am usually fairly sensitive to natural beauty and as I recall the physical features of that wood, which had a creek running through it, I am sure that had I run across it last spring in a day off from my ambulance work I should have considered it a beautiful place. It was on a beautiful July morning that I visited it; however, I have absolutely no recollection of beauty in connection with the place. Literally a sort of blackness seems to surround each vivid picture of that wood as I recall it. It was my first sight of the reality of war, the irrevocableness of death, and the aspect of hands and faces set like waxwork in the expressions they had taken on yesterday, and would continue to wear as long as they were discernible.

My mission in the wood was not to chat with the Alabaman, but to locate the front lines of the regiment on his left, in order that its supporting artillery might know where to fire and where to avoid firing. I had hardly done half of my work, however, when a lieutenant who was showing me his platoon line received a message which he turned over to me with a shake of the head and a half-shudder. It was an order for an immediate advance. When I handed him back the paper he was shaking all over as if undergoing an intense chill. "The same stuff Alabama pulled," said he, and then, bravely and unconcernedly: "It's so damned cold out here I can hardly stand still." In fact, the sky had clouded and a cool drizzle was falling.

The next officers I met were a captain and a platoon commander; they greeted me cheerfully: "Just add four kilometres to your range, please," said the Captain. "We're moving-up—you fellows have done very good work in the past, you surely won't object to a little change like that." I went back and took my post, with the Major, for the advance, and began a walk of about two hours and a half through woods and over ridges where the Germans had left their heavy ammunition and some of their dead, but no living man to trouble us. The end of that time found us—the advance battalion—on a broad hillside overlooking a rich deserted valley and a silent village on the other side of a stream. The Major was planning for the reconnaissance of the village, which looked ominous, and on the outskirts of which some Boche artilleryman was quietly adjusting a piece. To "adjust" is to fire on a spot whose position on the map is accurately known, in order to find out the exact variation from normal of the particular lot of ammunition you are using. Just then we saw a pretty and welcome sight: a patrol of eight or ten French cavalrymen, lances and all, strung out to about fifty yards apart, trotting briskly down a road in the valley to our right toward the town. They rode on until the first horseman was on the bridge leading to the gates of the town. Then we heard a machine-gun, the first Frenchman fell from his horse, and the rest galloped off up the valley to our left.

A rocket went up from the town and burst, showing one green star, and in about three minutes the Boche artillery began laying a light barrage between us and the town, leaving us untouched on the hillside. In a few minutes, an agreeable looking French officer walked up to where the Major and the rest of us were lying flat in a wheat-field, saluted formally, standing very erect, and joined us. By this time the Boche machine-gunners in the town had identified the Major and his staff and were giving us periodical attention, to my great concern. The infantry, by the way, are much more thoroughly terrified by high-explosive shells than by machine-gun bullets, owing, I think, to the big noise they make and to the

hateful contortions into which they throw the bodies of those whom they hit. On the other hand, to me personally and to all other artillery-men with whom I have discussed the matter, machine-gun fire is much the more terrifying. We have a saving sense of the inaccuracies to which artillery is subject under the best conditions, we know that if one lies flat on the ground, or, better, in a depression, there is little chance of being hurt by anything less than a direct hit by the projectile itself, and the chances of such a direct hit are small. We know, moreover, that we can always hear the shell coming and tell whether it will land near us, and, if so, have plenty of time to flatten ourselves before it arrives. Machine-gun bullets, on the other hand, are not to be heard until they are actually passing, they always seem to pass between one's ear and shoulder, and they give one the unpleasant consciousness that before one has time to think another thought one may be irrevocably dead.

To return to the French cavalry officer: He reported to the Major calmly and in good English: "I cannot tell you where they all are, but I can tell you that one of their machine-guns is just across that bridge yonder, because one of my men was shot there." Another rocket went up from the town. This one burst into three white stars. A few minutes later the range of the Boche artillery began to lengthen and shells began falling among the forward elements of the battalion. At the same time I noticed something which, though much less dramatic than the high explosive fire, frightened me much more, namely, six or eight comparatively small explosions at intervals over our heads accompanied by puffs of white smoke in the air where the explosions were heard—in other words, shrapnel. Against troops in the open, shrapnel is far from being the kind of joke that high explosive shell may be. High explosive lands, partly burries itself, and explodes, throwing fragments up and out, so that the wise soldier, lying flat on his stomach, is in very little danger. Shrapnel, on the other hand, explodes in the air above the target and is so made that this explosion, like the explosion in the barrel of a shot-gun, drives forward and downward and scatters over the ground a large number of lead balls. Almost any kind of military shelter will stop these balls, but if you are in the open there is not much you can do to escape them, and a good artillery-man can thoroughly sprinkle considerable territory in a very short time.

When I saw the shrapnel bursting over our heads as we lay on that open hillside, I simply made up my mind to die, and I gritted my teeth and felt indescribably sick at heart at the prospect of seeing an entire battalion shot into debris. All the reasons I had for wanting to continue to live came back to me at once, and summarized themselves into a picture of a green lawn on a summer afternoon with the children playing in a sand-pile and mother handing me a glass of cool lemonade. Any reasons for disregarding the risk of death refused to come to mind and had to be dragged out—Wall Street, the law's delay, the rich man's contumely, the insufferable nuisance in daily life of keeping oneself respected by and on terms with a wrong-minded world, and provided with the necessities of a respectable existence. All these things, and the sweetness and propriety of dying for one's country, I rehearsed in a forced and artificial way. Finally, I stabilized myself to this point of view: whatever I may think of it, this thing must go ahead, and in all probability I must die or be severely wounded. I may just as well do it *avec un petit peu de chic* as in a shameful and demoralized way; it will mean the difference between making these hours, which in any event will very likely be the last of my life, quite tolerable and almost pleasant, by reason of a tickled vanity, instead of allowing them to be a hideous terror-stricken nightmare. In that frame of mind, substantially, I continued for the next three weeks. You will observe that my moral plane is much lower than that of any hero of fiction, patriotic speeches, or the newspapers, but, at least, I am describing it to you with absolute frankness. However, the business never did become pleasant. Toward the end I began to get used to it, and more indifferent than before, but there was never a time when I would have wished to prolong the War or my part in it for an unnecessary instant for the sake of the joy or glory of the thing.

As for the shrapnel-fire that first afternoon, it stopped after those first eight or ten bursts, which hurt no one. Either the Boche had no direct observation by artillery officers, and therefore could not adjust his shrapnel satisfactorily, or he thought the range too long for good work with that weapon. The fire with high-explosive shells, however, continued—the range always lengthening. I ventured to suggest to the Major that it might be safer to withdraw his battalion back of the nearest crest, so that the Boche might not have the satisfaction of seeing whether we were where they were shooting and might thus be discouraged from firing. He did so, but we were still troubled by shell-fire. On our left flank, some of our men who had pushed out a little way came within range of another village containing machine-guns, and one of them was killed. It was the first killing that I witnessed, and again I felt sick at heart. I watched the distracted way in which his comrades tried to pick him up by his arms and legs and take him back to our line and ran for a stretcher.

It was now getting dark. The Major gave the order for his men to dig in. The situation was stabilized for the night and I went to report it to my Colonel. I started back with a young private who had been slightly wounded in the arm by a small fragment. He was glad to be going back, and I will admit that I was, too.

COLD WEATHER, it was found by the United Eastern Mining Co. at Oatman, Arizona, decreased the rate of settling slime in the thickeners, and increased the time required for dissolving the gold by cyanide. A 75-hp. boiler was erected for heating the solutions, resulting in overcoming these difficulties. Mill-heating cost 1.5 cents per ton treated during 1917.

QUICKSILVER occurs in the richer silver ores of Cobalt. During its past financial year the Kerr Lake company produced 546 lb. of mercury, recovered from metallics.

The Ferro-Alloys

By J. W. RICHARDS

*Ferro-alloys are of great importance to the steel industry. The steel-maker uses them for two purposes: (1) As reagents to take oxygen out of melted steel and thus ensure sound solid castings (ferro-manganese, ferro-silicon, ferro-aluminum). (2) To put into the steel a proportion of the rare metal (ferro-manganese, ferro-chromium, ferro-tungsten, ferro-molybdenum, ferro-vanadium, ferro-titanium, ferro-uranium, ferro-boron). Melted steel, just before taking from the furnace, always contains some oxygen dissolved in it, like the dissolved gas in charged soda water. If this is not removed, the casting is unsound from cavities or blow-holes. The addition of a small amount of an element or metal with a high affinity for oxygen removes this element and makes the casting sound. Manganese in the proportion of 1% or less, is the cheapest and most generally used reagent for accomplishing this; silicon to the extent of ½% or less, is more powerful, but also more expensive, and is often used to supplement the action of manganese; aluminum, 0.1% or less, is still more powerful and still more expensive, and is used in very small quantities as a final addition to complete the action of the manganese and silicon.

The second use is to make special steels, that is, steels containing such quantities of the rare metal as give to them properties different from plain carbon steels deoxidized by manganese, silicon, or aluminum. Thus we may make manganese steel by putting in 12 to 14% of manganese, making a very tough hard steel, such as is used in mining and grinding machinery and burglar-proof vaults; 2 to 4% of chromium makes a very hard tool-steel; 15 to 25% of tungsten makes high-speed tool-steel, which cuts iron while red hot; 6 to 10% of molybdenum has powers similar to tungsten, and is also used in steel for lining large guns. Vanadium in quantities from $\frac{1}{10}$ to ½%, makes very strong steel which resists shock extremely well, as when used for automobile axles; titanium, uranium, and boron impart valuable properties not so easily described. Every one of these materials is used for producing some specific result which is not produced by any other. The value of these special steels to the industries, and particularly for military purposes, is very great, so great that the supply of ferro-alloys for their manufacture is an important factor in winning the War.

FERRO-MOLYBDENUM. Molybdenum has only recently come into large use in steel. Its action being somewhat similar to tungsten, scarcity of the latter metal, particularly in Europe, has led to the manufacture of ferro-molybdenum on a comparatively large scale. The ores are widely distributed, but not plentiful. The sulphide, molybdenite, used to be roasted to molybdenum oxide, and this reduced by carbon in the presence of iron ore or scrap-iron in an electric furnace. It is now smelted directly in the electric furnace with carbon and a large excess of lime along with iron ore or scrap-iron. Ferro, with 50 to 60% of molybdenum, is tapped from the furnace like other ferro-alloys, but with molybdenum up to 80% the alloy has such a high melting-point that it cannot be tapped without freezing; it is necessary to make a furnace full of this alloy; then let the furnace cool down and take it apart, taking out a large mass of solidified alloy; the furnace is then re-built. The large use of molybdenum in steel has been so recent that not much has been made public about it. Rumor says that the large German guns, the 'Black Berthas', which bombarded Liége, were lined with 6% of molybdenum steel to increase their resistance to erosion. It seems certain that Germany drew considerable supplies of molybdenite from Norway to compensate for shortage of tungsten for high-speed tool-steel. Parts of guns, gun-carriages, motors, automobiles, have also been made of molybdenum steel of most excellent quality. Canada has been especially active in the manufacture of ferro-molybdenum, most of which it exported to Europe. This alloy is therefore another pre-eminently valuable war material.

FERRO-VANADIUM. Without vanadium the modern automobile or auto-truck would be a much weaker machine. When steel is desired to withstand the heaviest shocks and vibration, nothing is so effective as vanadium. This is another comparatively rare metal, found principally in the radium ores of Colorado and as a black sulphide on the highlands of Peru. The canary yellow Colorado ore is treated for radium and the residues for vanadium and uranium. The U. S. government operates this process for the radium supply. The black ore of Peru is rich and unusual; it is a sulphide with some asphaltic matter, and it is roasted and brought into the condition of iron-vanadium oxide before reduction. The oxides are best reduced by metallic aluminum—vanadium oxide plus aluminum produces vanadium plus aluminum-oxide slag. This is the well-known 'thermit' (Goldschmidt) method of reduction. Electric-furnace reduction by carbon is not advantageous because of the large amount of carbon taken up by the alloy; powdered silicon is therefore put into the charge as the reducing agent, together with iron, lime, and fluorspar, and then a 30 to 40% vanadium alloy is obtained with seldom over 1% of carbon—a very desirable composition. Only small amounts of vanadium are necessary in improving the

*Abstract: Paper read at the National Exposition of Chemical Industries.

steel; 0.1 to 0.4% are the usual quantities. This is fortunate, because vanadium costs $5 per pound and over. Metallurgists suspect that part of the improvement of the steel may be due to the vanadium combining with and removing nitrogen dissolved in the melted steel. This is probably true, yet some advantage undoubtedly must be ascribed to the final vanadium content; steels thus treated are unusually resistant to shock and alternate stresses, making them useful for axles, cranks, piston-rods, and such severe service.

FERRO-TITANIUM. Titanium is an abundant element in nature. It occurs in immense amounts as a double oxide of titanium and iron, known as ilmenite, or titanic iron ore. This ore can be reduced directly by carbon in electric furnaces to ferro-titanium. The reduction proceeds easier if some aluminum is put in as a reducing agent, but this is expensive and unnecessary. The alloy, running 15 to 25% titanium, is sold for use in steel as a refining agent to remove oxygen and nitrogen. Thousands of tons of steel for rails have been treated thus, the tests showing considerable improvement in the mechanical properties by the use of small amounts (0.10 to 0.20%) of titanium. Only one firm in America makes this alloy, and its use in steel has not yet gained universal approval.

FERRO-BORON. This is an alloy whose valuable qualities have not yet been entirely determined. Boron is the metallic base of borax, which is a sodium-boron oxide. Borax is difficult to reduce. Another raw material, not so abundant, is colemanite, containing lime and boron oxide. Many attempts have been made, none very successfully, to reduce this with iron oxide to ferro-boron. The American Borax Co. offered a prize for several years for a process that would accomplish this. Boron oxide occurs rarely in nature, but it can be manufactured from borax and colemanite. When the oxide is obtained this can be combined with iron oxide and the resultant boron-iron compound reduced by carbon in the electric furnace to ferro-boron. Small quantities of this alloy have been manufactured. Experiments on steel have shown that ferro-boron acts somewhat similarly to ferro-vanadium. Experiments in France showed remarkably strong and tough steels were thus made, using 0.5 to 2% of boron.

The ferro-alloys are exceedingly important materials to the steel-maker. They are indispensable. They are important factors in producing both ordinary and fine steels, and therefore in winning the War. The country well supplied with them has a great advantage over the country in which they are scarce. They are deserving of all the expert attention which they are receiving from the War Industries Board, the steel-makers, and the economists. The possession by the United States of large supplies and resources for the ferro-alloys may be one of the important factors in determining the quick ending of the War.

INGOT-IRON can be annealed in an electric furnace to such a degree of softness as to permit of this metal being substituted for copper in many of the instances wherein copper is now employed on account of its available soft characteristics.

Electrostatic Precipitation

There are certain practical points connected with the operation of the Cottrell plants which I think should be discussed, although they are not so directly brought up by the author of the paper.

In the early days of the Cottrell apparatus, they treated moist fumes or gases carrying material that could be precipitated—sulphuric acid was the first. The treating of dry gases seemed to be a problem. Lately, we have been gathering information from various plants which indicates that a certain amount of moisture in the gases is necessary for good precipitation of the dust. At one plant, a relative humidification of 42% is considered the best proportion. This has been obtained by sprays of water from the roof of the flue leading to the Cottrell apparatus, and since those sprays were put in, the results have shown a wonderful improvement. At the plant of the International Smelting Co. at Miami, the concentrate treated in the roasters to which the apparatus is applied contain so much moisture that the gases naturally have the proper proportion, and the results at the plant are extremely good. When visiting a plant in the East not long ago, I noticed that the motor-generator set originally installed had been discarded, and a small synchronous motor had been put in to drive the rectifier. The superintendent explained that they took their power from a public service company, and had no trouble whatever from surges on the line, and no complaints at all from the power company since installing this synchronous motor, but that they had experienced no end of trouble in operating their Cottrell treater so long as they used a motor-generator set. I called the attention of some of the superintendents at our various plants that were using Cottrell treaters to this fact, but it only seemed to touch a sore spot with them; it seemed that there had been a great deal of discussion among the superintendents of the various plants, as well as the electrical experts, on this point. Some of those who had been instrumental in designing installations thought that the dangers from surges were so great that the use of synchronous motors was absolutely unsafe, and that the possible saving of a few dollars should not be considered at all in the installation of the Cottrell treater; that the main thing was to get the dust precipitated, and that a slight increase of efficiency in the electrical end of the apparatus was not worthy of consideration.

On my present trip I have found that the electrical expert in charge of the precipitation department in one of the plants has become fully convinced that the synchronous motor is the proper apparatus to install, and he demonstrated this to my untechnical eyes very clearly. They had four motor-generator sets on each side of the centre of the building, with transformers corresponding to each set. Four of these motor-generator sets had been re-wound, so that they were practically synchronous motors, and were driving the rectifiers.—E. P. Mathewson, at the Colorado meeting of A. I. M. E., September 1918.

RENO, NEVADA

Silver-Lead Mining.—The Con. Virginia.—Tungsten Mills.—Tonopah Divide.—Goldfield Consolidated.

Work has been resumed at the Groom mine and a 100-ton mill is to be erected on this once famous silver-lead producer in western Lincoln county. Many years ago the mine produced a considerable quantity of high-grade ore; the better grade was freighted over 100 miles to the nearest shipping point, and some ore was concentrated in jigs. Within the past five years production has been considerable, the ore being hauled by tractors to Indian Springs station on the L. V. & T. railroad, a distance of 65 miles. In most of the ore the principal content is lead, and the mine is said to contain a large tonnage carrying from 15 to 30% of that metal. The old main shaft is being unwatered and a new shaft is to be sunk. Salt Lake men are sinking a shaft in pay-ore a short distance south of the Groom mine, and seven miles north two Goldfield miners are working two groups of claims, on both of which they have exposed good ore. A small mill on one of these properties is to be enlarged. The district has abundant water and timber.

In the Con. Virginia mine at Virginia City new ground is being explored on the 2100-ft. level. The west cross-cut, reported to be showing some good ore, is in a vein described by Whitman Symmes, the superintendent, as being farther west than any of the veins developed on deep levels and apparently not drained by any of the other workings. Mr. Symmes also reports a favorable showing in the roof of the north drift on the 2200-ft. level. Ore sent to the mill from the Con. Virginia mine in October has averaged $17 per ton, as against an average of $14.84 in September. Other mines of the Comstock have made a normal production from the usual footage of development.——Two tungsten mills are being erected near Sodaville, in Mineral county, and a third is in prospect for the same district. Joseph Bean, William Noonan, and L. E. Beck are building one of these mills to treat ore from a lease they have been working on the property owned and formerly operated by Atkins, Kroll & Co. This lease has produced some high-grade scheelite, one carload having yielded a net return of $9000, according to the lessees, who claim to have blocked a substantial tonnage of mill-grade ore. The higher-grade product has been shipped to reduction works in Humboldt county, Nevada. Parties from Wheeling, West Virginia, who have had mining interests in this region for many years, have acquired ground adjoining the Atkins-Kroll group and, working from a 200-ft. shaft, have exposed a large tonnage of pay-ore. They are building a 60-ton plant to treat this product. In the same district scheelite has been found at a number of places on the property of the Berndy Tungsten Mines Co.——Raymond T. Baker, director of the Mint, has arrived at Reno to remain until after the general election. His arrival was delayed by an attack of influenza, from which he has quite recovered, and he was compelled to postpone the meeting of mint superintendents and Government assayers, which he had called for October 15 at Carson City. Mr. Baker says this meeting will not be held until the epidemic has disappeared. His object in calling the meeting is to bring about betterments in the service that will benefit the mining industry, but there is no intention of resuming coinage of the metals at the Carson mint.——Silver-gold ore is being shipped from the Tonopah Divide mine, six miles south of Tonopah, to the Goldfield Consolidated mill at Goldfield at the rate of 200 tons weekly and the output will be increased to a 60-ton carload daily; sufficient to pay for development and provide a surplus for mill or railroad construction within a year. An auxiliary hoist has been installed at the 370-ft. level and the shaft will be sunk to water-level, estimated to be below 700 ft. Drifts on the 160, 265, and 370-ft. levels are being extended on the lode while cross-cuts and raises are being driven at 50-ft. intervals to block the ore on these levels. No stoping has been done and the ore-dump at the shaft is said to contain 6000 tons of $30 ore. A cross-cut on the 260-ft. level is being driven south to cut the vein that yielded high-grade gold ore at the surface, higher on the mountain. Medium-grade ore has been found on the 295-ft. level of the Gold Zone property, adjoining the Divide mine on the east. The find was made in driving near the Divide end-line. The East Divide Co. has installed a complete electrically-driven surface plant, including a compressor and air-drills, and is sinking on the Merced claim, just east of the Gold Zone, at a point where the vein-croppings gave assays up to $5 gold. The shaft is down 70 ft. and has been in soft ground, broken easily by pick and hand-drill. The first lateral work will be at the 300-ft. level. The Brougher Divide has installed electric machinery and will deepen its shaft.——At Goldfield the mill of the Consolidated Mines Co. is treating 700 tons of mill-tailing daily, in addition to some low-grade mine and dump ore and the product of the Tonopah Divide mine. The pits opened in the tailing pond by the big grab-bucket of the Lidgerwood cableway are at a depth where some of the higher-grade tailing is now being handled. Lessees working from the Gold Bar shaft of the C. O. D. Consolidated have shipped several carloads of good ore, exposed at depths of 150 and 200 ft. in extending old workings. Wide faces of

PART OF GOLDFIELD

good mill-ore have been exposed at a number of points down to the 400-ft. level. The C. O. D. embraces the extension of veins that have yielded good ore on the adjoining Florence, Atlanta, and Consolidated properties. Development work has been started on the 600-ft. level of the Red Hill Florence, which continues shipping ore of good grade from six faces on the 400 and 500-ft. levels. The shaft has been re-timbered to the 600-ft. level, where the station was enlarged and heavily timbered for the work now in progress. The shaft of the Silver Pick Con. will be sunk at once another 50 ft. from the 1260-ft. point, in order to better explore the zone just penetrated, where molybdenum has been found, together with quartz yielding encouraging assays in gold and silver. The Great Bend mine is reported by J. K. Turner, consulting engineer, to be in better condition than for some time past, with stopes on the 160-ft. level producing ore of shipping grade and the new raise from the 370-ft. level entering the first of the series of ore-shoots developed at the 260-ft. level. A large tonnage of good mill-ore has been exposed in developing the higher-grade deposits and tests have been made lately with a view to remodeling the company's small mill and treating this ore. In the Atlanta mine a raise from the 1850-ft. level is following the foot-wall near the point where the shale forms the wall, and wide seams of good ore have been found. The Blue Bull is breaking high-grade ore from a narrow vein opened in a raise from the 250-ft. level. The shaft of the Grandma Consolidated was sunk 830 ft., well within the shale, and has been equipped for extended development. The sump cross-cut, driven west 100 ft., exposed some $14 ore in the contact-zone. Drifts are being advanced north and south at 805 ft., on the shale. H. G. McMahon, secretary and manager for the Cracker Jack company, has returned to Goldfield from New York and may decide to resume work on that property, in which ore of good grade was exposed at a depth of 300 ft. The Spearhead company will continue its development work, according to A. A. Codd, secretary. It was feared that the labor shortage and depleted funds would necessitate a suspension of work. The Merger Mines Co. is not working but is awaiting the results of development at depth in the adjoining Atlanta. Mr. D'Arcy, manager of the Kewanas, has only a small force at work in the southern area, but reports encouraging results from his more recent work. The Silvermines Corporation has suspended work for the present at Hornsilver, 26 miles south of Goldfield. The new 150-ton mill made a satisfactory extraction, but the ore is too low-grade to yield a profit under present conditions.

TUCSON, ARIZONA

Arizona Tax Commission and the Standard Oil Co.

The attack made by the Standard Oil Company on the system of valuation employed by the Arizona Tax Commission by means of an injunction suit filed in the United States District Court at Tucson is likely to re-open the whole question of corporate taxation, including that of the mines, if the plaintiff should be successful. As taxes on producing mines are the principal source of revenue to the State and as the amount paid by the mining companies reaches the millions, the litigation is of far-reaching importance. The assessed valuation of Arizona mines for 1918 was recently announced by the Tax Commission as a slight advance over the 1917 figures, which were $393,421,536, which is 56% of the gross valuation. This is an increase of 87.3% since Arizona became a State. Together with the railroads, the mines share in the payment of about two-thirds of the State's revenue. The taxing of railroads is done under a special statute, on the basis of valuation per mile, so that they will not be affected by the outcome of the suit. The mining companies have long been dissatisfied with the regulations under which their assessments have been figured by the Commission and repeated attempts to secure enactment by the legislature of a mine-taxation law have been made without success. The system applied to the Standard Oil Co. this year for the first time is similar to that developed to reach the mines and first applied to the latter, and subsequently to other business. The assessed valuation of the property of the Standard Oil Co. in all counties of the State was $342,646, and it was upon this valuation that it was taxed in 1917. The system employed by the commission this year, when it sat as a board of equalization, was to capitalize the company's net profits, calculated at $727,649 on an assumed basis of 25%, thus arriving at a valuation for assessment purposes of $2,910,597. The net income of producing mines is capitalized at 15%. The complaint attacks the action of the Commission on constitutional grounds, Federal and State. The company considers that the effect of the Commission's order to tax the income of the company's wells, refineries, and manufacturies in California as the profits they have used as a basis of valuation are proceeds from this property and not from Arizona agencies.

CRIPPLE CREEK, COLORADO

Vindicator Con.—Ferro-Alloys.—Strike on the Deadwood.

The quarterly report of the Vindicator Consolidated Gold Mining Co., mailed stockholders with the dividend of 1 cent per share, payable October 25, amounting to $15,000, shows a reserve on hand of $225,000, and net earnings for the third quarter of 1018 of $95,000. G. S. Wood, the president, further announced that the "results of development work during the past two years have impressed the directors with the need of acquiring additional property with which to extend the operations of the company" and announces the acquisition of the plant of the Ferro Alloy company of Denver together with a lease and option on a chrome property near Glenrock, Wyoming. The basis of the purchase was the liquidation of the debts of the Ferro Alloy company amounting to $100,411, which amount was more than covered by the liquid assets of the company, and a further payment to the stockholders of the amount of their investment, together with 6% interest, which is to be paid from profits of operating of the plant of the Ferro Alloy company. The price paid for the lease and option amounted to $12,743. Additional machinery to double the capacity of the plant is estimated at $25,000 and the installation has been authorized, with the expenditure of $20,000 for development of the chrome deposit. Ample supplies of manganese, tungsten, silicon, uranium, and vanadium are reported "available in Colorado and adjacent States for the manufacture of the ferro-alloys of those metals." The Ferro Alloy, it is reported, had been operating at a moderate profit, but found operations curtailed by lack of capital; hence the sale. The plant of the company is at Denver.——The Cresson Consolidated Gold Mining & Milling Co. will pay the regular monthly dividend of 10c. per share, $122,000, on November 10.——The Golden Cycle M. & R. Co. will pay the regular monthly dividend of 3c. per share, $45,000, on the same date. A. E. Carlton of this city and Colorado Springs is president of both corporations.——The Strong mine, near Victor, with a production record in excess of $10,000,000 from its 7½ acres, will close-down at the end of October, and for the duration of the War. The labor shortage and enhanced operating costs are the reasons for the shut-down. The Strong Gold Mining Co. is a close corporation controlled by Colorado Springs capitalists.——A rich strike has been made at shallow depth, 55 ft., on the Deadwood claim of the United Gold Mines Co. on Bull hill. The strike was made in the long abandoned Williams shaft, by the Deadwood leasing company, whose stockholders are Denver and district operators. The superintendent, Sam Stumpff, an old

district miner, has opened up five feet of shipping-ore, carrying an 8 to 12-in. core that assays as high as 3 oz. gold or $640 per ton. The initial shipment to leave the mine this week is estimated at 5 oz. ore.——The Big Toad G. M. Co. operating the Dante mine under lease is exploiting the claim from the 600-ft. level of the main shaft by diamond-drill. The drilling commenced this week and is being watched closely by those controlling adjacent property.——M. Chagneau of Paris, France, representing the French National Defense league, is this week examining the potash deposits near Hartsel in Park county, Colorado, about 30 miles west of Cripple Creek. The property is owned by Mrs. E. R. Ashe of Denver.——Four Japanese mining men, S. Shinosaki from New York, U. S. manager of the Furukawa company, Richachiro Kanoko, chief accountant, and Yuichi Sato, mining engineer of the same company, and Keli Nako, chief electrical engineer of the Ashio mine, visited the district during the past week. The Japanese are visiting the mining districts of Colorado and the West with a view to introducing new methods and machinery in their native land.

VICTORIA, BRITISH COLUMBIA

Smelting Charges.—Sampling-Plant.—International Mining Convention.

After marking time for several months, a definite announcement has been made as to plans of the committee appointed by the Associated Boards of Trade of eastern British Columbia to conduct an investigation into the matter of the treatment charges of the Consolidated M. & S. Co. at Trail. The first session was held at Nelson on October 31 and was called "to receive evidence from shippers of ore to Trail."

At a meeting of the Vancouver Chamber of Mines held recently, the Hon. Martin Burrell, Minister of Mines, stated that an ore-sampling plant would be established in this Province by the Dominion government.

An international mining convention will be held at Vancouver from January 8 to 10, 1919, inclusive. It will be conducted under the auspices of the Vancouver Chamber of Mines, the officials of which body propose bringing some of the most prominent mining men of the continent to this Province to participate in the proceedings.

The West Kootenay Power & Light Co. has ordered 800,000 lb. of copper cable and other material from manufacturers at Hamilton, Ontario. This is sufficient for 300 miles of line and will be used chiefly in extending the circuit from Greenwood to Copper Mountain, to supply power for the B. C. Copper Mining Co. at that point.

DURANGO, COLORADO

Gold King Extension

As a result of efficient work under the management of W. Z. Kinney, the Gold King Extension Mines Co. will be added to the list of shippers from the district long before the scheduled date. If climatic conditions are favorable, with a long open season, a large tonnage will be shipped before the close of the year. The mill will be running by November 1. Considering the shortage of labor, the reopening of the Gold King within such a short period is quite an achievement, as those acquainted with the difficulties peculiar to operating in the Gladstone district were of the opinion that it would not be possible for the new company to begin production before next season. A force of 50 men is employed at the present time, at both mine and mill, and as the mill speeds up to normal capacity—500 tons of concentrates per month—the force will be increased. The Gold King ships an iron-copper sulphide ore, carrying gold and silver, and frequently pockets of exceptionally high-grade ore are found. Operations have always been on an extensive scale, and exert a decided influence on the property of the district. It is indicative of the marked interest being shown by outside capital in the Silverton district that the Cocomongo Mines Co., of Toledo, Ohio, now operating mines at Bonanza, is investigating a mine near Silverton.——The Mears & Wilfley tailing plant will probably continue to operate until the close of November, labor conditions having improved, and the recovery during the past season having been gratifying. At the present time the plant is shipping concentrate at the rate of 800 tons per month.——Ray Crawford is leasing on the Champion, and will install a small air-compressor, a motor, and a Leadville hoist.——A 310-ft. raise is being driven from the Koehler tunnel to the Carbon workings, on the Summit Copper property, in the Red Mountain district.——Considerable interest is being shown in the Stony Pass mining district.——Near Animas

Forks, A. W. Johnson is doing some preliminary work on the Columbus mine. Good headway is being made on a cross-cut tunnel that is to cut a lead vein. In addition to developing the Columbus, Mr. Johnson expects to ship ore from the Mountain Queen at an early date.——At Telluride, the Lewis Mining & Leasing Co. closed down for the season on September 30. Shortage of labor and the high cost of operating are given as the cause. Eighty-one cars of ore were shipped from the Telluride district during September. The Little Annie, Golden Gate, and Lucky Three Lodes have been patented by Oscar Bengston.——At Ouray, the Ouray Consolidated Mining & Reduction Co. has been developing the Guadeloupe property; in the breast of the north drift a three-foot vein of bornite copper ore has been opened. A car-load is ready for shipment, and from now on five tons per day will be pulled.——At Rico the shortage of labor has been somewhat relieved, and increased activity is being shown in all of the leading properties. The exploitation of sulphur and alunite deposits is receiving attention. The Marmatite Mining & Milling Co. is extending its holdings; in addition to leasing the Silver Swan, the Pro Patria mine, mill, and tramway have been taken under control, and a force of men is engaged in opening up the entire length of the Enterprize vein. A number of leases have been secured on the Syndicate Mining & Milling Co.'s holdings. The most interesting development is the formation of a company of large resources, directed by Bulkeley Wells, to open up the alunite-potash deposits on Calico peak. During winter exploratory work will be done to determine the depth of the deposits, and if indications warrant it, a large mill with a capacity of 200 tons per day will be built. Phil Flynn has been appointed superintendent.——Marked interest is now being shown in the sulphur beds near Dunton. There is a report that the Government may undertake the development of some of these deposits.

ARIZONA

Tucson.—William Howard Taft, former president of the United States, has been appointed special master by Judge W. H. Sawtelle of the U. S. District Court at Tucson in the case of Allan Forbes of Boston and George D. Morris of Prescott, receivers for the Gila Copper Sulphide Co., against the American Smelting & Refining Co. The Gila company is asking a permanent injunction against the Hayden smelter restraining them from refusing to handle ores from the Christmas mine according to contract. The temporary injunction granted in July is continued during the pendency of the hearing. The smelter wants a change in the contract on account of differences in the ore-treatment rate occasioned by abnormal conditions due to the War. The American Smelting & Refining Co. operates the Christmas mine, but does so under a contract as agents for the Gila company.

COLORADO

Lake City.—There is a growing interest in the Lake City field, and work is being carried on by a number of claim-holders. One of the main handicaps to development is a lack of capital.

The old Ulay shaft is being pumped out preparatory to development; as the water subsides, timber that has been submerged for 30 years is revealed.

Ouray.—The Ouray Con. M. & D. Co. is milling Treasury Tunnel ore and recently shipped a car of good concentrate. The main driving gear at the Treasury Tunnel mill broke and stopped operations for several days; steel gear is to replace the machine.

The holdings of the Gold Crown M. & R. Co. have been foreclosed to satisfy a judgment in favor of the John Frickice Lumber Company.

Rico.—The Marmatite M. & M. Co. is shipping heavily. The company has purchased a building in the city to be used as a boarding-house and club for a large force of miners. Recently a lease was secured on the Silver Swan, and a few men are now engaged in development on this property.

The Rico Wellington company has almost completed its drift to the Leap Year fissure, and a large quantity of good copper ore is being opened. Shipments averaged 50 tons per month. Now that the men are released from tunnel work it is expected that a large tonnage will be shipped.

The Milwaukee Gold Mining Co. has been declared defunct.

Silverton.—The Sunnyside M. & M. Co. is employing 300 men. A new boarding-house has been completed, and is considered one of the best appointed and comfortable in the State. The policy of the Sunnyside is to make the camp as agreeable as possible to miners, thereby attracting steady and high-class workers.

The Henrietta Copper Mines Co. shipped its first car of ore late in September. The ore assays high in copper, and carries good value in gold and silver. Prospects are encouraging.

The Mears & Wilfley plant will probably close down earlier than usual this year owing to the difficulty in securing labor.

J. T. Terry is extending his holdings in the Eureka district, and has acquired the properties of the Sunlight M. & M. Co., and of the California Mountain Mining Company.

Telluride.—The Lewis Mining & Leasing Co. may be compelled to shut-down on account of the shortage of labor.

The Cimmaron mine, under lease to the Wagners, is being extensively developed. At present the operators are getting out a dry gold-iron sulphide. Plans are now being made to develop the lower tunnel of the Bradley claim, where recent examination shows good lead and zinc ore. Samples assayed over 12% zinc, from which a 40% concentrate can be made. The Cimmaron mill is prepared to dress 150 tons of this ore daily.

KANSAS

Baxter Springs.—The Constitutional Lead & Zinc Mining Co. has its flotation plant in operation at the Midas mill, six miles south-west of this place. This system is known as the 'Buchart' and is successful in saving the extremely fine mineral which could not be done by ordinary methods of concentration. W. P. Eberlein of Joplin, superintendent of the Constitutional, states that the system is the greatest saving device that can be installed, and in time a majority of the new plants probably will be equipped with such apparatus. In an ordinary mill making 10 tons of concentrate per day an additional ton can easily be made by using the 'Buchart' system with the flotation plant. The additional expense for oil, chemicals, and power is small.

Kendall.—Barnes-King Development pays 10c. per share on November 15. This is equal to $40,000. The mines yielded gold worth $48,442 from 7120 tons during September.

Waco.—The High Five Mining Co., owned by Webb City men, is building a 300-ton (in 10 hours) mill. Drilling in 17 holes cut good ore at depths of 135 to 250 ft. Two shafts have been sunk. A Pomona pump, driven by a 100-hp. Nordberg oil-engine, takes care of the water. The owner of the land gets a 10% royalty from the lessees.

MONTANA

Ennis.—J. H. Pankey, manager of the Missouri and McKee mines on South Meadow creek, Madison county, has the 10-stamp mill, cyanide tanks, and aerial tramway nearly ready for operations.——The parties that have been operating manganese properties, 12 to 16 miles south of here, have discontinued hauling by their pneumatic two-ton trucks, four of them, and are now hauling wheat 18 to 20 miles at Norris for $8 per ton. The manganese occurred in narrow seams—streaks and pockets—of high grade, but not enough of it.—An asbestos property is being developed about 40 miles south of here.

The Winnetka property, four miles up Alder gulch from Virginia City, is running its concentrating mill continuously and making regular shipments of concentrate. It is reported that recently the company had found new bodies of good-grade ore. Harry Hall is manager.——The Metcalf mine, at the head of Barton gulch, has discontinued milling owing to inability to secure teams to haul the ore. W. O. Thompson is the owner.——The Highland Chief mine, four miles west of Virginia City, is being examined under an option to purchase after the water is pumped out. E. A.

Smith, of Whitehall, is the owner.——The Ruhl mine, three miles east of Sheridan, recently shipped a $1300 gold bar from two weeks clean-up of the 5-stamp mill.——The Lake Shore property, up Wisconsin creek, is putting in a new filter, in connection with its cyanide process. Several kinds of treatment have been tried out on this property.

TEXAS

Terlingua.—Development of a new quicksilver district, 40 miles east of here and 75 miles from the nearest railroad, is in progress. Rich cinnabar was discovered in that locality three years ago, but for some reason there was a delay in beginning work. It is stated that the Ellis Quicksilver Co. is now extracting considerable quantities of ore, and that the owners of other claims propose to put in machinery.

In the Terlingua district, an increase of quicksilver mining is noted. The producing area has been extended by the Study Butte Mining Co., which is developing a good property five miles east of here. The company is now erecting a new power-plant and oil-engine. Two miles farther east of the Study Butte is a large outcrop of cinnabar that is being mined by open-cut, by the Mariposa Mining Company.

WASHINGTON

Chewelah.—As more men become available, and the power supply has been increased to 600 hp., the United Copper company is to produce 900 tons of ore and concentrate in October, against 330 tons in the previous four months.

CANADA

British Columbia

Anyox.—Granby Consolidated produced 3,371,535 lb. of copper during September. Of this, 2,682,996 lb. was from the Anyox property. The Grand Forks plant yielded 288,539 lb., against 393,894 lb. in August, 672,289 lb. in July, and 889,140 lb. in June.

Revelstoke.—The Woolsey claims on Silver creek, a short distance from here, have been bonded by Calgary, Alberta, men for a substantial sum. The ore carries silver and lead, and is said to be high-grade. A road is to be constructed to replace the present trail to the mines, and a bridge to connect with the latter is promised over the Illecillewaet river.

Rossland.—One of the most striking illustrations in British Columbia of the effect of the gold situation is visible here. The mines of the Consolidated M. & S. Co. have been practically closed. There has been no ore shipped for some months, although work is being carried on in the principal mines of the district with small forces. Those employed, however, are engaged only in development. About 200 miners are working in the Le Roi, Centre Star, and War Eagle, while 80 are employed in the Josie, all of which are the Consolidated company's mines. On the Velvet, 9 miles from Rossland, owned by the Granby company, there are 50 men. The people of Rossland are not discouraged.

Silverton.—The Echo Silver-Lead company is said to have arranged for a lease of the Standard Silver-Lead company's mill during part of each month. A 4000-ft. aerial tram is being erected to connect with the Silverton tram. E. J. Burns and L. J. McAtee of Spokane are largely interested.

Manitoba

Development of the copper region north of The Pas, Manitoba, may be considerably hastened by the present urgent demand for the metal. The Mandy mine at Schist Lake, owned by the Tonopah Mining Co. of Nevada, has high-grade ore, making it profitable to mine and ship in spite of transportation difficulties. The more extensive deposits of the Flin Flon, estimated at 25,000,000 tons of $10 ore, of considerably lower grade, are not being worked, railway connection being regarded as a necessary preliminary step. A smelter will have to be built near the mine at a cost estimated at $4,000,000 or more. The Hon. Edward Brown, provincial treasurer of Manitoba, has announced that a railroad will shortly be constructed to the copper region, and will connect with the new Hudson Bay railway, 70 miles distant, at a cost of $2,000,000. Many construction projects are being held over until the close of the War, but owing to the need for copper this is regarded as essential work, demanding speedy action.

Quebec

Thetford.—The chrome industry in this Province is looked upon as of minor importance, and that importance entirely due to the War. A great many prospects and mines were opened during the early war boom, but those remaining are only three, where a fairly persistent supply is secured. They are, the Dominion Mines & Quarries at Lake St. Francis, the Reid Estate at Lake Caribou, and the Quebec Asbestos & Chrome Co., near Danville. The first of these ships its ore in crude form; the second is entirely a milling ore; while the third yields 40 to 45%, 15%, and 30 to 35% ore. Concentration of the ore has never received great consideration for the reason that the supply was always so doubtful that it alone appeared to be vital. The only scientific work so far has been done by the Mutual Chemical Co. at its two mills, Lake St. Francis and Black Lake. The result of this work marked no progress, however, as they at once faced a problem for which they could offer no solution, namely, the concentrate was clean and carried upward of 50% Cr_2O_3, but this 50% was made-up of 6 to 8% Al_2O_3, which vitiated the product for their particular use.

Vancouver Island

Victoria.—Development on a fairly large scale continues at the Old Sport copper property, which has been under bond to the Consolidated M. & S. Co. since September 1916, on Elk lake near Quatsino sound. Diamond-drilling results have been satisfactory, and it is expected that it will not be long before the company will commence shipping. The ore carries between 1.4 and 4% copper. A water-power plant has been developed from Canyon creek, supplying 50 hp. at present with a 350-ft. head; but 425 hp. can be developed at low water. The flume is 8000 ft. long to a 900-ft. pipe-line. A two-drill compressor-plant, electric-light plant, compressed-air friction-hoist, Cameron sinking-pump, etc., are at work. William Clancy is mine superintendent.

Another promising Vancouver Island property, which is attracting considerable attention, is the Sunlock claims, on the Jordan river, 42 miles by motor-road from Victoria. Extensive development is being carried out under the supervision of R. H. Stewart, formerly with the Consolidated M. & S. Co. Results are highly encouraging, and the mine is predicted to become a large producer. W. M. Brewer, District Engineer, inspected the property last year. Four tunnels have exposed three distinct ore-zones, as well as extensive surface stripping across another, known as the centre zone, where three open-cuts have been made on apparently three seperate mineralized zones at elevations between 780 and 865 ft. Each cut is 20 ft. long across an orebody. It is a low-grade copper property, samples assaying between 1.2 and 2.7%, some showing gold and silver valued at 50c. per ton. A wagon-road has been constructed this year a distance of 6000 feet.

Rich silver ore has been opened in six properties in a mineral belt known as 'Lightning Peak', near Edgedoow, on the west side of the Arrow lakes, 100 miles from Revelstoke.

Yukon

Dawson.—Navigation on the Yukon river closed for the winter on October 22. A mail launch arriving from White Horse, ran the last 50 miles through floating ice. More than 400 outbound Alaskans left White Horse for Skagway and the 'outside'. This is believed the largest number ever leaving in the Yukon valley in one day.

Mining Decisions

Mining Machinery—Removal by Lessee

Where a mining lease gave the lessee the right to remove his machinery at the termination of the lease, and it was left on the ground and extensively repaired by the lessor for a period of six months from and after the cancellation of the lease, the lessee and his creditors were held to have forfeited their interest therein.

Heim v. Brock (Arkansas), 202 Southwestern, 36.

Mineral Rights—Adverse Possession

Where the ownership of minerals underlying land has been separated by a conveyance from that of the surface, possession of the surface does not necessarily carry with it possession of the underlying minerals. The mining of coal by a grantee of the surface of the land, although for such time as to give him title to the coal in place by adverse possession, did not give him title to oil and gas deposits not then known to exist as against a prior grantee of the mineral rights in the land.

Kentucky Block Cannel Coal Co. v. Sewell (Kentucky), 249 Federal, 840.

Sale of Coal Rights—What Conveyed

A purchaser by general warranty deed of all the coal under the grantor's land, waiving the right of surface support and containing no time limit within which the coal must be removed, is entitled to use the gangways made in removing the coal for the transportation of coal from other lands adjoining the first grantor's farm, even though several years elapsed between the final removal of all coal from beneath the grantor's land except the pillars supporting the surface.

Westerman v. Pennsylvania Salt Mfg. Co. (Pennsylvania), 103 Atlantic, 539.

Depositing Debris on Land—Damages
